
Normal skin turgor *(Wilson and Giddens, 2009)*

sklero-. See **sclero-.**

skull [ME, *skulle,* shell], the bony structure of the head, consisting of the cranium and the skeleton of the face. The cranium, which contains and protects the brain, consists of 8 bones; the skeleton of the face is composed of 14 bones.

skullcap, an herb that is native to temperate regions of North America.

■ USES: It has been used as folk medicine to treat convulsions, hysteria, and nervous tension and is a common component of remedies for premenstrual syndrome and other female problems. There is insufficient reliable evidence regarding its effectiveness.

■ CONTRAINDICATIONS: Skullcap should not be used during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant.

skull shield, a protective plastic plate worn over a cranial defect.

skull x-ray, radiographic imaging of the bones of the skull, the nasal sinuses, and cerebral calcifications. Skull x-rays have largely been replaced by computed tomography scanning of the brain.

SL, abbreviation for **soda lime.**

slaked lime. See **calcium hydroxide.**

slander [Fr, *esclandre,* scandal], any words spoken with malice that are untrue and prejudicial to the reputation, professional practice, commercial trade, office, or business of another person. Formerly, slander included published defamation, but at present it is limited to spoken accusation. To bring legal action in slander, the slandered person must be able to demonstrate real temporal damages—except for cases in which the defamation relates to the person's business or profession or in which the malicious words question the person's chastity or accuse him or her of being a felon or of having a loathsome disease. Compare **libel.**

slant of occlusal plane [ME, *slenten,* to slope], the angle between the extended occlusal plane and the axis-orbital plane.

SLE, abbreviation for **systemic lupus erythematosus.**

sleep[1] [AS, *slaepan,* to sleep], a state marked by reduced consciousness, diminished activity of the skeletal muscles, and depressed metabolism. People normally experience sleep in patterns that follow four observable, progressive stages. A device such as an encephalograph is used to record the recurrent pattern of brain waves during the stages. During stage 1 the brain waves are of the theta type, followed in stage 2 by the appearance of distinctive sleep spindles; during stages 3 and 4 the theta waves are replaced by delta waves. These four stages represent three fourths of a period of typical sleep and collectively are called **nonrapid eye movement** sleep. The remaining time is usually occupied with **rapid eye movement (REM)** sleep, which can be detected with electrodes placed on the skin around the eyes so that tiny electric discharges from contractions of the eye muscles are transmitted to recording equipment. The REM sleep periods, lasting from a few minutes to half an hour, alternate with the NREM periods. Dreaming occurs during REM time. Individual sleep patterns normally change throughout life because daily requirements for sleep gradually diminish from as much as 20 hours a day in infancy to as little as 6 hours a day in old age. Infants tend to begin a sleep period with REM sleep, whereas REM activity usually follows the four stages of NREM sleep in adults.

sleep[2]**,** a nursing outcome from the Nursing Outcomes Classification (NOC) defined as natural periodic suspension of consciousness during which the body is restored. See also **Nursing Outcomes Classification.**

sleep apnea, a sleep disorder characterized by periods in which respiration is absent. The person is momentarily unable to contract respiratory muscles or to maintain airflow through the nose and mouth. See also **apnea, obstructive sleep apnea.**

sleep enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the facilitation of regular sleep/wake cycles. See also **Nursing Interventions Classification.**

sleep epilepsy. See **narcolepsy.**

sleeping pill, **1.** *(informal)* a prescription sedative taken for insomnia or for postoperative sedation. **2.** an over-the-counter pill classified pharmaceutically as an aid to sleeping. Antihistamines, such as pyrilamine maleate, diphenhydramine, and doxylamine succinate, depend for sedative action on side effects, which may disappear with continued use of such agents. The use of all drugs that depress the central nervous system is contraindicated for pregnant and lactating women and for asthma, glaucoma, or prostatic hypertrophy patients.

sleeping sickness. See **African trypanosomiasis.**

sleep studies, an electrodiagnostic test used to diagnose obstructive sleep apnea. It is performed in a sleep laboratory where the patient is monitored by electrocardiogram, pulse oximetry, electroencephalogram, and electromyography. Also called **polysomnography.**

sleep technologist. See **polysomnographic technologist.**

sleep terror disorder [AS, *slaepan* + L, *terrere,* to frighten], a condition occurring during stage 3 or 4 of nonrapid eye movement sleep. It is characterized by repeated episodes of abrupt awakening, usually with a panicky scream, accompanied by intense anxiety, confusion, agitation, disorientation, unresponsiveness, marked motor movements, and total amnesia concerning the event. The disorder usually occurs in children, is more common in boys than in girls, and is extremely variable in frequency but is more likely to occur if the individual is fatigued or under stress or has been given a tricyclic antidepressant or neuroleptic at bedtime. Compare **nightmare.** See also **pavor nocturnus.**

sleep-wake schedule disorder, a form of dyssomnia caused by a conflict between a person's circadian rhythm and the socioeconomic demands of society, such as work and travel schedules.

sleepwalking. See **somnambulism.**

slice /slīs/ [OFr, *esclice*], (in tomography) a cross-sectional plane of the body selected for imaging.

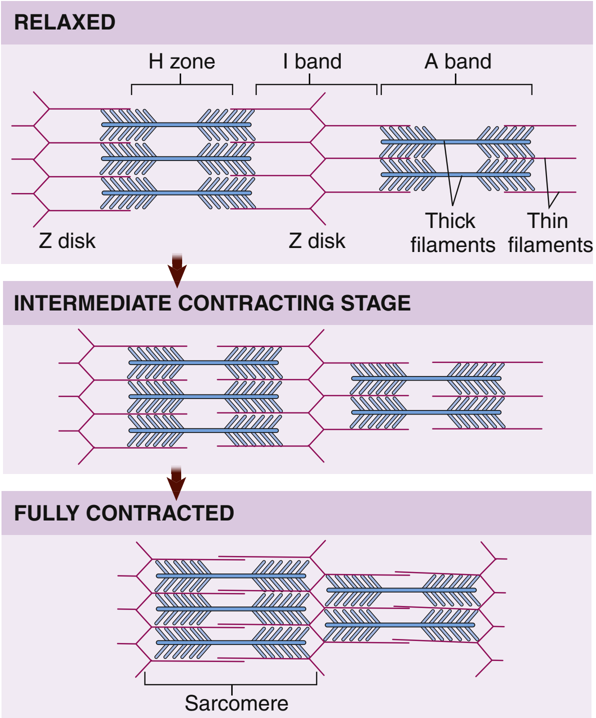
slice sensitivity profile, a curve showing the effect of broadening of the computed tomography slice thickness along the patient axis in helical CT.

slide clamp [AS, *slidan* + *clam,* fastener], a device, usually constructed of plastic, used to regulate the flow of IV solution. The slide clamp has a graduated opening through which the IV tubing passes. Pushing the tube into the narrow end of the opening constricts it and reduces the flow rate of the IV solution. Sliding the wide end of the opening over the tube increases the flow rate. Compare **roller clamp, screw clamp.**

slide tracheoplasty, surgical treatment of tracheal stenosis by dividing the stenosis at the midpoint, incising the segments vertically on opposite anterior and posterior surfaces, and sliding the segments together to create an anastomosis with a widened lumen.

sliding esophageal hiatal hernia, a protrusion of the cardioesophageal junction and stomach through the esophageal hiatus.

sliding filaments [AS, *slidan* + L, *filamentum,* thread], interdigitated thick and thin filaments of a sarcomere. In muscle



Sliding filaments *(Patton and Thibodeau, 2010)*

contraction they slide past each other so that the sarcomere becomes shorter although the filament lengths do not change. The action of the sliding filaments contributes to the increased thickness of a muscle in contraction.

sliding hernia, a protrusion of either the cecum or the sigmoid colon into the parietal peritoneum. The protrusion can be either abdominal or esophageal. Also called **slipped hernia.**

sliding hiatal hernia, a protrusion of the upper stomach and cardioesophageal junction through the diaphragm into the posterior mediastinum.

sliding transfer, the movement of a person in a sitting position from one site to another, such as from a bed to a wheelchair, by sliding him or her along a transfer board.

sling [ME, *slingen,* to hurl], a bandage or device used to support an injured part of the body, especially a forearm. See also **sling restraint.**

sling restraint, a therapeutic device, usually constructed of felt, used to assist in the immobilization of patients, especially orthopedic patients in traction. The sling is placed over the pelvis to reduce pelvic motion with lower extremity traction or over the abdominal area as countertraction with Dunlop traction. With lower extremity traction the sling restraint is attached to both sides of the bedspring frame. Compare **diaper restraint, jacket restraint.** See also **Dunlop skeletal traction, Dunlop skin traction.**

slip-on blood pump [ME, *slippen,* slippery, *on*], a plastic mesh device with an attached squeeze bulb, rubber tubing, and pressure gauge, used to help administer large amounts of blood quickly. The plastic mesh slips over the blood bag and exerts pressure on it when the bulb is squeezed. The pressure gauge displays a danger zone, usually marked in red, and indicates pressure limits for safe blood administration. Excessive pressure may damage the red blood cells or may disconnect the primary IV line.

slipped disk. See **herniated disk.**

slipped femoral epiphysis, a failure of the femoral epiphyseal plate, tending to occur primarily in overweight adolescents as a result of hormonal changes. Clinical features include hip stiffness and pain, with difficulty in walking. There also may be knee pain and external rotation of the affected leg. The condition is treated by orthopedic surgery.

slipped hernia. See **sliding hernia.**

slipping patella [ME, *slippen* + L, *patella,* small dish], a patella that undergoes recurrent dislocation.

slipping rib, a condition in which a loose ligament allows one of the lower five ribs to slip inside or outside an adjacent rib, causing pain or discomfort. The symptoms may mimic those of a disorder of the pancreas, gallbladder, or other upper abdominal organ.

slit diaphragm, a thin membrane that spans the slit pore of the renal glomerulus.

slit lamp [AS, *slitan* + Gk, *lampein,* to shine], an instrument used in ophthalmology for examining the external, surface, and internal segments of the eye, including the eyelid(s), lashes, conjunctiva, cornea, anterior chamber, pupil, iris, vitreous, and retina. A high-intensity beam of light is projected through a narrow slit, and a cross section of the illuminated part of the eye is examined through a magnifying lens. A second, hand-held lens is used to examine the retina.

slit-lamp microscope, a microscope for ophthalmic examination. It permits the viewer to examine the endothelium of the posterior surface of the cornea in a projected band of light that is shaped like a slit.

slit scan radiography, a technique for producing radiographs of body structures without length distortion by scanning a fan-shaped beam of x-rays through a narrow-slit collimator. The beam divergence perpendicular to the scan results in some distortion of width.

slit tongue. See **forked tongue.**

slit-ventricle syndrome, a condition of chronic headaches and cardiac disorders affecting shunt-dependent patients. Characteristics include small ventricles and slow reflux of the valve mechanism of the shunt.

SLO, abbreviation for **scanning laser ophthalmoscope.**

Slo-Phyllin, a trademark for a bronchodilator **(theophylline).**

slough /sluf/ [ME, *sluh,* husk], **1.** *v,* to shed or cast off dead tissue, such as cells of the endometrium, shed during menstruation. **2.** *n,* the tissue that has been shed.

slow-acting insulin. See **long-acting insulin.**

slow channel, a membrane channel that is slow to become activated. An example is the calcium channel, which allows calcium ions to diffuse across membranes. See also **calcium channel blocker.**

slow diastolic depolarization [AS, *slaw,* dull], the slow loss of membrane polarization that occurs between action potentials in cells of the sinus and atrioventricular nodes.

Slow-K, a trademark for a slow-release tablet of an electrolyte replacement **(potassium chloride).**

slow pain, an unpleasant sensory experience that travels a multisynaptic route to the brain via slow-conducting, nonmyelinated nerve fibers.

slow pulse [AS, *slaw,* dull; L, *pulsare,* to beat], a pulse rate of less than 60 beats/min. The rate is common among older people, conditioned athletes, and patients receiving beta-blockers. See also **bradycardia.**

slow-reacting substance of anaphylaxis (SRS-A), a group of active substances, including histamine and leukotrienes, that are released during an anaphylactic reaction. They cause the smooth muscle contraction and vascular dilation that cause the signs and symptoms of anaphylaxis.

slow-response action potential, a cardiac action potential produced by the influx of calcium ions without the typical and much faster influx of sodium ions. Such an action potential has a slow upstroke, low amplitude, and consequent slow conduction.

slow stroking, a therapeutic massage technique of slow continuous movement of the hands over the paravertebral areas along the spine from the cervical through the lumbar region. Usually a lubricant is applied to the skin, and the index and middle fingers are used to stroke both sides of the spinal column simultaneously. Also called **effleurage.**

slow-twitch (ST) fiber, a muscle fiber that develops less tension more slowly than a fast-twitch fiber. The ST fiber is usually fatigue resistant and has adequate oxygen and enzyme activity. Studies indicate that world-class endurance runners apparently have high percentages of ST fibers. It is called *red muscle* because of the abundance of capillaries serving the fiber muscle. The muscle also contains high amounts of the protein myoglobin that functions to store oxygen inside the muscle cell. See also **fast-twitch fiber.**

slow vestibular stimulation, a feeding therapy technique for disabled children, designed to promote parasympathetic loading.

slow virus, a virus, such as lentivirus, that remains dormant in the body after initial infection. Years may elapse before symptoms occur. Several degenerative diseases of the central nervous system are believed to be caused by slow viruses, including subacute sclerosing panencephalitis and kuru.

SLP, **1.** abbreviation for **single-locus probe. 2.** abbreviation for **speech-language pathologist.**

slurred speech /slurd/ [D, *sleuren,* to drag; ME, *speche*], abnormal speech in which words are not enunciated clearly or completely but are run together or partially eliminated. The condition may be caused by weakness of the muscles of articulation, damage to a motor neuron, cerebellar disease, drug use, or carelessness.

slurry /slur′ē/ [ME, *sloor,* mud], a thin suspension of finely divided solids in a liquid.

Sly syndrome /slī/ [William S. Sly, American physician, b. 1932], a mucopolysaccharidosis caused by deficiency of an enzyme important for the degradation of various mucopolysaccharides. It is characterized by excretion of mucopolysaccharides in the urine and by granular inclusions in granulocytes. Onset is between 1 and 2 years of age, with mild to moderate Hurler-like features, including dysostosis multiplex, pigeon breast, organomegaly, cardiac murmurs, short stature, and moderate mental retardation. Milder forms exist. Also called **MPS VII.**

Sm, symbol for the element **samarium.**

smack, *slang.* heroin.

small bowel follow-through (SBF) test, an x-ray with contrast dye (usually barium) performed to identify abnormalities in the small bowel. X-ray films done at timed intervals follow the progression of the contrast medium through the small intestine. The SBF series is also helpful in identifying and defining the anatomy of small bowel fistulas.

small calorie. See **calorie.**

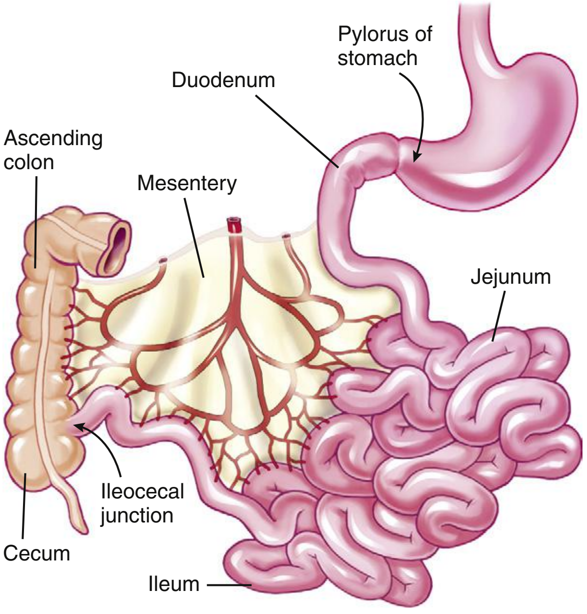
small cardiac vein [AS, *smael*], one of the five tributaries of the coronary sinus that drain blood from the myocardium. It conveys blood from the back of the right atrium and the right ventricle. Also called **right coronary vein.** Compare **great cardiac vein, middle cardiac vein, posterior vein of left ventricle.**

small cell carcinoma. See **oat cell carcinoma.**

smallest cardiac vein, one of the tiny vessels that drain deoxygenated blood from the myocardium into the atria. A few of these vessels end in the ventricles. Also called **vein of Thebesius.** Compare **anterior cardiac vein.** See also **coronary vein.**

small for gestational age (SGA) infant, a newborn whose weight and size at birth fall below the tenth percentile of appropriate for gestational age infants, whether delivered at term or earlier or later than term. Factors associated with smallness or retardation of intrauterine growth other than genetic influences include any disorder causing short stature, such as dwarfism; malnutrition caused by placental insufficiency; and certain infectious agents, including cytomegalovirus, rubella virus, and *Toxoplasma gondii*. Other factors associated with the smallness of an SGA infant include cigarette smoking by the mother during pregnancy, her addiction to alcohol or heroin, and her having received methadone treatment. Asphyxia may be a significant risk for the SGA infant during labor and delivery if the condition is the result of placental insufficiency. Such an infant has a low Apgar score, becomes acidotic in labor and at birth, and is likely to experience hypoglycemia within the first hours or days of life. Given adequate nutrition and caloric intake, some SGA infants show phenomenal catch-up growth. Also called *small for dates (SFD) infant*. Compare **appropriate for gestational age infant, large for gestational age infant.** See also **dysmaturity.**

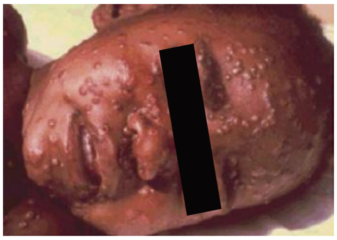
small intestine, the longest part of the digestive tract, extending for about 7 m from the pylorus of the stomach to the iliocecal junction. It is divided into the duodenum, jejunum, and ileum. Decreasing in diameter from beginning to end, it is situated in the central and caudal part of the abdominal cavity, surrounded by large intestine. It functions in digestion and is the major organ of absorption of prepared food. Compare **large intestine.**



Small intestine

small omentum. See **lesser omentum.**

smallpox /smôl′poks/ [AS, *smael* + *pocc*], a highly contagious and sometimes fatal viral disease characterized by fever, prostration, and a vesicular, pustular rash. It is caused by one of two species of poxvirus, variola minor (alastrim) or variola major, the latter being the severe and most common form. Because human beings are the only reservoir for the virus, worldwide vaccination with vaccinia, a related poxvirus, has been effective in eradicating smallpox; the last case of smallpox in the U.S. was in 1949, and the last recorded case in the world was in Somalia in 1977. The only known remaining sources of the virus are stored frozen at the U.S. Centers for Disease Control and Prevention. Smallpox is a potential agent for bioterrorism. Also called **variola, variola major.**



Smallpox

(Courtesy Centers for Disease Control and Prevention Public Health Image Library (PHIL) ID#3. Source: CDC/Cheryl Tyron)

smallpox vaccine, a vaccine prepared from dried smallpox virus. It is currently indicated only for laboratory workers and certain military personnel who could be exposed to pox viruses, but this recommendation could change with bioterrorism concerns.

smallpox virus, variola virus.

small saphenous vein, a large superficial vein embedded in the subcutaneous fascia of the lower limb that passes behind the distal end of the fibula and up the back of the leg to penetrate deep fascia and join the popliteal vein posterior to the knee. The small saphenous veins originate from the lateral side of a dorsal venous arch of the foot.

small sciatic nerve [AS, *smael* + Gk, *ischiadikos,* of the hip joint; L, *nervus*], the posterior femoral cutaneous nerve, which pierces the fascia and subdivides into filaments, supplying the skin from the level of the greater trochanter to the middle of the thigh.

SMBG, abbreviation for **self-monitoring of blood glucose.**

smear [AS, *smeoru,* grease], a laboratory specimen for microscopic examination prepared by spreading a thin film of tissue or fluid on a glass slide. A dye, stain, reagent, diluent, or lysing agent may be applied to the specimen, depending on the purpose of the examination.

smegma /smeg′mə/ [Gk, soap], a secretion of sebaceous glands, especially the foul-smelling secretion sometimes found under the foreskin of the penis and at the base of the labia minora near the glans clitoris.

smell [ME, *smellen,* to detect odors], **1.** the special sense that allows perception of odors through the stimulation of the olfactory nerves; olfaction. See also **anosmia. 2.** any odor, pleasant or unpleasant.

smelling salt [ME, *smellen* + AS, *sealt*], aromatized ammonium carbonate to which may be added ammonia. It is used as a stimulant to arouse a person who has fainted.

Smith fracture [Robert W. Smith, Irish surgeon, 1807–1873], a fracture of the wrist involving volar displacement and angulation of a distal bone fragment. Also called **reverse Colles' fracture.**

Smith-Hodge pessary. See **pessary.**

Smith-Lemli-Opitz syndrome /ō′pitz/ [John Marius Opitz, German-born pediatrician in United States, b. 1935], an autosomal-dominant syndrome consisting of hypertelorism and hernias and, in males, hypospadias, cryptorchidism, and bifid scrotum. Cardiac anomalies, laryngotracheal malformations, imperforate anus, renal defects, lung hypoplasia, and downslanted palpebral fissures may also be present. Also called **G syndrome, hypertelorism-hypospadias syndrome.**

Smith-Petersen nail [Marius N. Smith-Petersen, American surgeon, 1886–1953; AS, *naegel,* nail], a three-flanged, stainless steel nail used in orthopedic surgery to anchor the neck of the femur to its head in the repair of an intertrochanteric fracture. It is introduced below the prominence of the greater trochanter and passed through the fractured part into the head of the femur. See also **nail, pin.**

smog, a polluting combination of smoke and fog in the atmosphere.

smoke inhalation [AS, *smoca* + L, *in,* within, *halare,* to breathe], the inhalation of noxious fumes or irritating particulate matter that may cause severe pulmonary damage. Respiratory burns are difficult to distinguish from simple smoke inhalation. Chemical pneumonitis, asphyxiation, and physical trauma to the respiratory passages may occur.

■ OBSERVATIONS: Characteristics include irritation of the upper respiratory tract, singed nasal hairs, dyspnea, hypoxia, dusty gray sputum, rhonchi, rales, restlessness, anxiety, cough, and hoarseness. Pulmonary edema may develop up to 48 hours after exposure.

■ INTERVENTIONS: Airway maintenance and ventilatory assistance are essential. Endotracheal intubation, high-flow oxygen, and mechanical ventilation may be needed. Arterial blood gases are monitored, and corticosteroids may be given.

■ NURSING CONSIDERATIONS: The characteristics of smoke inhalation and its treatment vary with the nature of the fumes or matter inhaled and the extent of exposure. It is therefore important to know the circumstances, nature, and period of exposure and to know whether the person has a history of chronic respiratory or cardiac disease.

smokeless tobacco [AS, *smoca* + Sp, *tabaco*], **1.** chewing tobacco or tobacco powder that allows the stimulating components of tobacco to be absorbed through the digestive tract, or through the mucous membrane in the case of snuff. **2.** a transdermal nicotine patch that can be affixed to the upper part of the body to satisfy the person's craving for nicotine.

smoking cessation assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as helping another stop smoking. See also **Nursing Interventions Classification.**

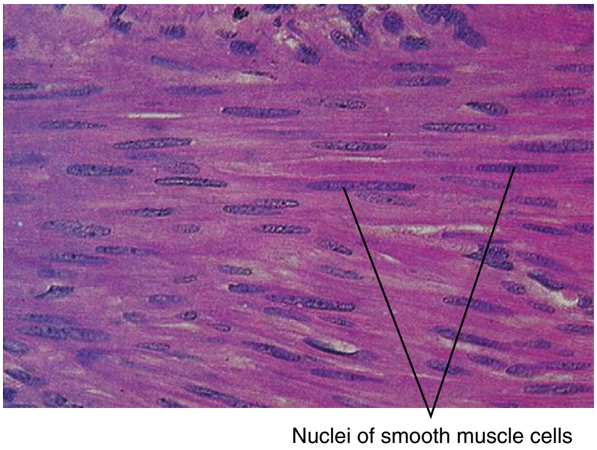
smoking cessation behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to eliminate tobacco use. See also **Nursing Outcomes Classification.**

smooth chorion, the smooth (nonvillous) and membranous part of the chorion.

smooth muscle [AS, *smoth*], one of three kinds of muscle, composed of elongated, spindle-shaped cells in muscles not under voluntary control, such as the smooth muscle of the intestines, stomach, and other viscera. The nucleated cells of smooth muscle are arranged parallel to one another and to the long axis of the muscle they form. Smooth muscle fibers are shorter than striated muscle fibers, have only one nucleus per fiber, and are smooth in appearance. Biofeedback devices may help many people gain partial control of contractions of involuntary smooth muscles. Also called **involuntary muscle, unstriated muscle.** Compare **cardiac muscle, striated muscle.**

smooth muscle relaxant, an agent that reduces the tone of smooth muscle, such as a bronchodilator or vasodilator.

smooth pursuit eye movement, the tracking by the eyes of a slowly moving object at a steady coordinated velocity, rather than in saccades.



Smooth muscle *(© Ed Reschke; used with permission)*

smooth sphincter dyssynergia. See **bladder neck dyssynergia.**

smooth surface cavity, a cavity formed by decay that starts on surfaces of teeth without pits, fissures, or enamel faults.

SMR, abbreviation for **submucous resection.**

smudge cell [ME, *sogen,* to soil], a disrupted lymphocyte, sometimes seen during preparation of blood smears.

Sn, symbol for the element **tin.**

S.N., abbreviation for *student nurse,* used in signing nursing notes (in the United States).

S_N2, abbreviation for **bimolecular reaction.**

SNA, **1.** abbreviation for **State Nurses Association.** **2.** abbreviation for *Student Nurses Association*.

snail [AS, *snagel,* slug], an invertebrate of the order Gastropoda, several species of which are intermediate hosts of the blood flukes that cause angiostrongyliasis in humans.

snakebite [AS, *snacan,* to creep, *bitan*], a wound resulting from penetration of the flesh by the fangs or teeth of a snake. Bites by snakes known to be nonvenomous are treated as puncture wounds; those produced by an unidentified or poisonous snake require immediate attention. The bitten area should be immobilized below heart level, the patient kept still, and prompt transportation arranged to an emergency department. Only polyvalent antivenin is available for bites of all pit vipers, including rattlesnakes, copperheads, and cottonmouths. Pit vipers are responsible for 98 of the poisonous snakebites in the United States. Bites of pit vipers are characterized by pain, redness, and edema followed by weakness, dizziness, profuse perspiration, nausea, vomiting, or weak pulse; subcutaneous hemorrhage; and, in severe cases, shock. Treatment may include the use of antivenin, analgesics, antibiotics, and antitetanus prophylaxis to prevent infections from pathogens found in the mouths of snakes. Patients sensitive to horse serum in antivenin may require antihistamines and steroids for the control of hives, urticaria, and other allergic reactions. Coral snakes rarely bite, but their venom contains a neurotoxin that can cause respiratory paralysis. Antivenin and respiratory support may be indicated.

snake venom [AS, *snacan* + L, *venenum*], a poison produced in glands of certain snakes and injected through fangs into a victim's flesh. The exact composition of snake venoms varies with different species, but generally they are complex mixtures of neurotoxins, proteolytic enzymes, and phosphatases. About 20 of more than 100 North American species of snakes are venomous, accounting for about 8000 snake venom poisonings a year. A venomous snakebite is considered a medical emergency.

snapper /snap′er/, any of various carnivorous marine fish of the family Lutjanidae found in tropical waters; they are often eaten by humans but sometimes contain ciguatoxin and can cause ciguatera.

snapping hip [ME, *snappen* + AS, *hype*], a condition in which a tendon slips over the greater trochanter of the femur when the hip is moved, possibly producing a loud, snapping sound.

snare /sner/ [AS, *sneare,* noose], a device designed for holding a wire noose, used in removing small stalklike growths. The operator tightens the wire around the stalk (peduncle), thus removing the growth.

Sneddon's syndrome /sned′ənz/ [Ian Bruce Sneddon, English dermatologist, b. 1915], a rare condition in which cerebral arteriopathy and ischemia are accompanied by diffuse noninflammatory livedo reticularis.

sneeze [AS, *snesen,* to sneeze], a sudden forceful involuntary expulsion of air through the nose and mouth occurring as a result of irritation to the mucous membranes of the upper respiratory tract, such as by dust, pollen, or viral inflammation. Also called **sternutation.**

Snellen chart [Hermann Snellen, Dutch ophthalmologist, 1834–1908], one of several charts used in testing visual acuity. Letters, numbers, or symbols are arranged on the chart in decreasing size from top to bottom.

Snellen's reflex [Hermann Snellen], unilateral congestion of the ear on stimulation of the distal end of the divided great auricular nerve.

Snellen test [Hermann Snellen], a test of visual acuity using a Snellen chart. The person being tested stands 20 feet from the chart and reads as many of the symbols as possible, reading each line and proceeding downward from the top. A score is assigned in the form of a ratio, comparing the subject's performance to that of a statistically normal subject's performance. For example, a person who can read at 20 feet what the average person can read at this distance has 20/20 vision, whereas a person who can read at 20 feet what the average person can read at 40 feet has 20/40 vision.

SNF, abbreviation for **skilled nursing facility.**

snore /snôr/, a harsh, rough sound of breathing caused by vibration of the uvula and soft palate during sleep.

snout reflex [ME, *snoute,* muzzle], an abnormal sign elicited by tapping the nose, resulting in a marked facial grimace.

snowball sampling, a method of obtaining subjects for a study by soliciting names of potential subjects from those participating in the study.

snow blindness [AS, *snaw* + *blind*], a condition of photophobia, sometimes accompanied by keratitis or conjunctivitis, as a result of overexposure of the eyes to the glare of sun on snow.

Snowden-Pencer scissors. See **scissors.**

SNP, **1.** abbreviation for **sodium nitroprusside.** **2.** abbreviation for **single nucleotide polymorphism.**

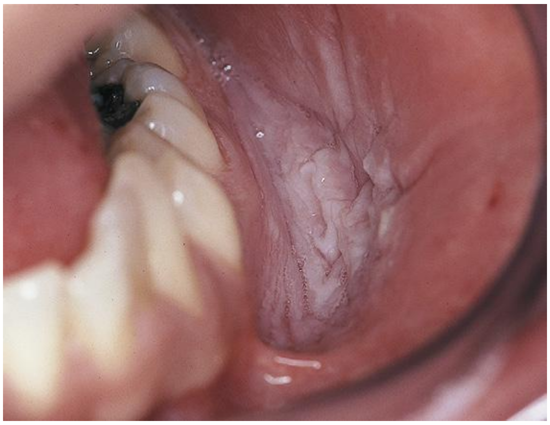
S.N.P, **1.** abbreviation for **school nurse practitioner.** **2.** abbreviation for *student nurse practitioner.*

SNP analysis, analysis of single nucleotide polymorphisms to assess artificially produced genetic modifications or identify different strains of an organism.

SNR, abbreviation for **signal-to-noise ratio.**

snuff, a powder that is inhaled through the nostrils.

snuff dipping, the practice of extracting juices from moist, fine-cut chewing tobacco placed in the mucobuccal fold of the mouth. The practice has been associated with an increased incidence of leukoplakia, tooth and gum diseases, and oral cancer.



Snuff dipper's pouch *(Regezi, Sciubba, and Pogrel, 2000)*

snuffles [D, *snuffelen,* to sniff], a nasal discharge in infancy characteristic of congenital syphilis. See also **syphilis.**

soap [L, *sapo*], a salt formed from fatty acids and an alkali. Soap cleanses because molecules of fat are attracted to the fatty part of the anions of soap in a water solution and are pulled off the dirty surface into the water. Compare **detergent.** See also **green soap, surfactant.**

SOAP /sōp′, es′ō′ā′pē′/, (in a problem-oriented medical record) abbreviation for *subjective, objective, assessment,* and *plan,* the four parts of a written account of the health problem. In taking and charting the patient history and physical examination, a SOAP statement is made for each syndrome, problem, symptom, or diagnosis. Charting by this method is said to be "soaped," and charts produced by using it are called "soap charts." See also **problem-oriented medical record.**

soapsuds enema (SSE) [L, *sapo* + D, *sudse,* marsh water; Gk, *enienai*], an evacuant enema made of 1 ounce of soft soap dissolved in 2 pints of hot water and administered at a temperature of 100° F (38° C). It acts by irritating the colon and stimulating peristalsis.

SOB, abbreviation for *short of breath.*

socia /sō′shē·ə/, an ectopic or displaced part of an organ, such as an accessory parotid gland.

social /so′shal/, pertaining to societies or other groups of people.

social adjustment rating scale. See **social readjustment rating scale.**

social anxiety disorder. See **social phobia.**

Social Behavior Assessment Scale /sō′shəl/, a semistructured interview guide that elicits information from significant others regarding a patient's functioning.

social breakdown syndrome [L, *socius,* partner; AS, *brecan* + *dune*], deterioration of social and interpersonal skills, work habits, and behavior seen in chronically hospitalized psychiatric patients. Symptoms are a result of long-term hospitalization rather than the primary illness and include excessive passivity, assumption of the chronic sick role, withdrawal, and apathy. Such effects are also seen in long-term inmates of prisons and concentration camps.

social class, a grouping of people with similar values, interests, income, education, and occupations.

social day-care center. See **adult day-care center.**

social deviance, behavior that violates social standards, engendering anger, resentment, and a desire for punishment in a significant segment of the society or culture.

social interaction skills, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal behaviors that promote effective relationships. See also **Nursing Outcomes Classification.**

social involvement, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as social interactions with persons, groups, or organizations. See also **Nursing Outcomes Classification.**

socialization /sō′shəlīzā′shən/, **1.** the process by which an individual learns to live in accordance with the expectations and standards of a group or society, acquiring its beliefs, habits, values, and accepted modes of behavior primarily through imitation, family interaction, and educational systems; the procedure by which society integrates the individual. **2.** (in psychoanalysis) the process of adjustment that begins in early childhood by which the individual becomes aware of the need to accommodate inner drives to the demands of external reality. See also **internalization.**

socialization enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of another person's ability to interact with others. See also **Nursing Interventions Classification.**

socialized medicine /sō′shəlīzd/, a system for the delivery of health care in which the expense of care is borne by a governmental agency supported by taxation rather than being paid directly by the client on a fee-for-service or contract basis. Also called **state medicine.**

social learning theory, a concept that the impulse to behave aggressively is subject to the influence of learning, socialization, and experience. Social learning theorists believe aggression is learned under voluntary control, by observation of aggressive behavior in others, and by direct experience.

social margin, the total of all resources (material, personal, and interpersonal) available to assist an individual in coping with stress.

social marketing, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the use of marketing principles to influence the health beliefs, attitudes, and behaviors to benefit a target population. See also **Nursing Interventions Classification.**

social medicine, an approach to the prevention and treatment of disease that is based on the study of human heredity, environment, social structures, and cultural values.

social mobility, the process of moving upward or downward in the social hierarchy.

social motivation, an incentive or drive resulting from a sociocultural influence that initiates behavior toward a particular goal. Compare **physiological motivation.**

social network, an interconnected group of cooperating significant others, who may or may not be related, with whom a person interacts.

social network therapy, the gathering together of patient, family, and other social contacts into group sessions for the purpose of problem solving.

social order, the manner in which a society is organized and the rules and standards required to maintain that organization.

social phobia, an anxiety disorder characterized by a compelling desire for the avoidance of and a persistent, irrational fear of situations in which the individual may be exposed to scrutiny by others. Examples of such situations are speaking, eating, or performing in public, or using public lavatories or transportation. Also called **social anxiety disorder.** Compare **simple phobia.** See also **phobia.**

social psychiatry, a field of psychiatry based on the study of social, cultural, and ecological influences on the development and course of mental diseases. In treatment social psychiatry favors the use of milieu or other situational approaches to therapy.

social psychology, the study of the effects of group membership on the behavior, attitudes, and beliefs of the individual.

social readjustment rating scale, a scale of 43 common events associated with some degree of disruption of an individual's life. The scale was developed by the psychologists T.J. Holmes and R. Rahe, who found that a number of serious physical disorders, such as myocardial infarction, peptic ulcer, and infections, and a variety of psychiatric disorders were associated with an accumulation of 200 or more points on the rating scale within a period of 1 year. Most disruptive on one's life, according to the psychologists, was the death of a spouse, which warranted 100 points. The lowest rated event was a minor law violation, rated at 11 points.

social sanctions, the measures used by a society to enforce its rules of acceptable behavior.

Social Security Act, a U.S. federal statute that provides for a national system of old age assistance, survivors' and old age insurance benefits, unemployment insurance and compensation, and other public welfare programs, including Medicare and Medicaid.

social support, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as reliable assistance from others. See also **Nursing Outcomes Classification.**

social support groups. See **support group.**

social support programs, services both paid and volunteer provided to older persons including visits with older individuals to decrease loneliness and social isolation, telephone contact for older persons for similar purposes, and programs that provide a daily call with emergency procedures that go into effect if the telephone is not answered.

social theories of aging, concepts of social and psychological adjustment in older persons. The theories include activity expressed in adoption of new roles and continuity, which includes retention of physical and social activities from the middle years.

social worker, a person with advanced education in dealing with social, emotional, and environmental problems associated with an illness or disability. A **medical social worker** usually has completed a master's degree program that includes experience in counseling patients and their families in a hospital setting. A **psychiatric social worker** may specialize in counseling individuals and families in dealing with social, emotional, or environmental problems pertaining to mental illness.

society /səsī′ətē/, a nation, community, or broad group of people who establish particular aims, beliefs, or standards of living and conduct.

Society for Advancement in Nursing (SAIN), a group established for advancement of the profession of nursing through higher education.

sociobiology /sō′sē·ō′bī·ol′əjē/ [L, *socius,* companion; Gk, *bios,* life, *logos,* science], the systematic study of biology as a basis for human behavior. Proponents contend that disease, stress, and aggression are natural pressures for maintaining an optimal level of population.

socioeconomic status /sō′sē·ō·ik′ənom′ik/ [L, *socius,* companion, *oeconomicus,* methodical, *status,* state], the position of an individual on a social-economic scale that measures such factors as education, income, type of occupation, place of residence, and, in some populations, heritage and religion.

sociogenic /-jen′ik/ [L, *socius* + Gk, *genesis,* origin], pertaining to personal or group activities that are motivated by social values and constraints.

sociolinguistics /-ling·gwis′tiks/, the study of the relationship between language and the social context in which it occurs. —*sociolinguistic, adj.*

sociology /sō′sē·ol′əjē/ [L, *socius* + Gk, *logos,* science], the study of group behavior within a society.

sociopath, popular term for antisocial personality.

sociopathic. See **psychopath.**

sociopathic personality. See **antisocial personality.**

sociopathy /sō′sē·op′əthē/ [L, *socius,* companion; Gk, *pathos,* disease], a personality disorder characterized by a lack of social responsibility and failure to adapt to ethical and social standards of the community.

sock aid, an adaptive device that enables disabled people who cannot reach their feet to don a pair of socks or stockings. One type consists of a dowel with a cuphook on the end. Also called **stocking aid.**

socket, the part of a prosthesis into which the stump of the remaining limb fits. Most modern prosthetic sockets are made of plastic, which is odorless and lighter and easier to clean than traditional leather sockets. See also **acetabulum, acromion.**

soda [It, *sodo,* solid], a compound of sodium, particularly sodium bicarbonate or sodium carbonate.

soda lime (SL), a mixture of sodium and calcium hydroxides used to absorb exhaled carbon dioxide in an anesthesia rebreathing system. Soda-lime glass beads are used in air-fluidized beds.

sodium (Na) /sō′dē·əm/ [soda + L, *ium*], a soft grayish metal of the alkaline metals group. Its atomic number is 11; its atomic mass is 22.99. Sodium is one of the most important elements in the body. Sodium ions are involved in acid-base balance, water balance, transmission of nerve impulses, and contraction of muscles. The recommended daily intake of sodium is 250 to 750 mg for infants 6 months to 1 year of age, 900 to 2700 mg for children 11 years of age or older, and 1100 to 3300 mg for adults. Sodium is an important component of more than 8 L of secretions produced by the body every day. These secretions include saliva, gastric and intestinal secretions, bile, and pancreatic fluid. The total daily secretion of sodium into these alimentary tract fluids averages between 1200 and 1400 mEq. A 154-pound adult has a total body pool of 2800 to 3000 mEq. It is also linked to chlorine, which is the most important extracellular anion in the body. Sodium is the chief electrolyte in interstitial fluid, and its interaction with potassium as the main intracellular electrolyte is critical to survival. A decrease in the sodium concentration of the interstitial fluid immediately decreases osmotic pressure, making it hypotonic to intracellular fluid osmotic pressure. The kidney is the chief regulator of sodium levels in body fluids and will excrete sodium-free urine when the body needs to conserve sodium. In high temperatures, such as those associated with fever, the body loses sodium through sweat, and sodium reserves are further diluted with additional water drunk by the affected individual. To prevent serious complications, depleted sodium must be replaced. Sodium salts, such as sodium bicarbonate, are widely used in medications. Sodium bicarbonate has an immediate and rapid antacid action on the stomach, but any excess rapidly enters the intestine so that the substance has a shorter action than that of other antacids. Sodium bicarbonate, which is very effective in rendering the urine alkaline, is an ingredient in many solutions used as douches, mouthwashes, and enemas. Sodium is also important in the transport of sodium and potassium ions through the cytoplasmic membrane.

sodium acid carbonate. See **sodium bicarbonate.**

sodium arsenite poisoning, a toxic condition caused by the ingestion of sodium arsenite, an insecticide and weed killer. The characteristic symptoms of arsenite poisoning are similar to those of arsenic poisoning, as is the treatment. See also **arsenic poisoning.**

sodium barbital, the sodium salt of 5,5-diethylbarbituric acid, a hypnotic and sedative drug.

sodium benzoate, an antifungal agent also used in a test of liver function.

sodium bicarbonate, a common salt (baking soda). Sodium is the most important cation in the extracellular fluid, and bicarbonate is the most import buffer in the body. Also called **sodium acid carbonate.**

■ INDICATIONS: It is prescribed in the treatment of metabolic acidosis, gastric hyperacidity, and hyperkalemia to alkalinize the urine as part of the treatment for certain poisonings.

■ CONTRAINDICATIONS: Alkalosis, hypernatremia, hypocalcemia, severe pulmonary edema, and abdominal pain of unknown cause prohibit its use. It should be administered in cardiac arrest only when there is documented metabolic acidosis of hyperkalemia.

■ ADVERSE EFFECTS: Among the more serious adverse effects are tetany, gastric distension, acid rebound, bicarbonate-induced alkalosis, hypernatremia, hypocalcemia, and hypokalemia.

sodium channel blocking agent, any of a class of antiarrhythmic agents that prevent ectopic beats by acting on partially inactivated sodium channels to inhibit abnormal depolarizations. Also called sodium channel blocker.

sodium chloride, common table salt used in various concentrations as a fluid and electrolyte replenisher, isotonic vehicle, irrigating solution, and enema.

sodium chloride and dextrose. See **dextrose and sodium chloride injection.**

sodium citrate, a sodium salt of citric acid, used as an anticoagulant for blood or plasma that is to be fractionated or for blood that is to be stored. It is also administered orally as a urinary alkalizer.

sodium etidronate. See **etidronate disodium.**

sodium ferric gluconate, a hematinic used especially in treatment of hemodialysis patients with iron deficiency anemia who are also receiving erythropoietin therapy. It is administered by intravenous injection.

sodium fluoride poisoning, a chronic condition of fluorine poisoning that occurs in some communities where the fluorine concentration in the water supply exceeds 1 ppm. Signs of the condition include mottling of tooth enamel and severe osteosclerosis. Also called **fluorosis.**

sodium glutamate. See **monosodium glutamate.**

sodium hydroxide, NaOH, a strongly alkaline and caustic compound; used as an alkalizing agent in pharmaceuticals.

sodium hypochlorite solution, a 5% aqueous solution of NaOCl (common bleach) used as a disinfectant for utensils and surfaces not harmed by its bleaching action.

sodium iodide, an iodine supplement.

■ INDICATIONS: It is prescribed in the treatment of thyrotoxic crisis and neonatal thyrotoxicosis and in the management of hyperthyroidism before thyroidectomy.

■ CONTRAINDICATIONS: Hyperkalemia or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are salivary gland swelling, metallic taste, rashes, and GI disturbances. Acute poisoning may result in angioedema and pulmonary edema.

sodium lactate injection, an electrolyte replenisher that has been prescribed for metabolic acidosis.

sodium nitrite, an antidote for cyanide poisoning, also used as a preservative in cured meats and other foods.

sodium nitroprusside (SNP), a vasodilator.

■ INDICATIONS: It is prescribed primarily in the emergency treatment of hypertensive crises and in heart failure.

■ CONTRAINDICATIONS: Certain compensatory forms of hypertension, such as coarctation of the aorta or impaired cerebral circulation, or known hypersensitivity to the drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are a rapid fall in blood pressure or symptoms of cyanide poisoning (cyanide is produced by the metabolism of nitroprusside). Muscle spasms also may occur.

sodium perborate, an oxygen-liberating antiseptic ($NaBO_2 \cdot H_2O_2 \cdot 3H_2O$) that may be used in treating necrotizing ulcerative gingivitis and other kinds of gingival inflammation and in bleaching pulpless teeth. Prolonged or indiscriminate use of the compound may cause burns of the oral mucosa and blacken the tongue.

sodium phenobarbital. See **phenobarbital.**

sodium phenylbutyrate, an agent used as adjunctive treatment to control the hyperammonemia of pediatric urea cycle enzyme disorders.

sodium phosphate, a saline cathartic.

■ INDICATIONS: It is prescribed to achieve prompt, thorough evacuation of the bowel and, in lower dosage, for laxative effect.

■ CONTRAINDICATIONS: Congestive heart failure, abdominal pain, edema, megacolon, hypovolemia, salt-restricted diet, or hypersensitivity to this drug prohibits its use. Frequent administration in any dosage is not recommended.

■ ADVERSE EFFECTS: Among the more severe adverse effects are dehydration, hypovolemia, abdominal cramping, and electrolyte imbalance.

sodium phosphate P32, an antineoplastic, antipolycythemic radioactive agent.

■ INDICATIONS: It is prescribed for treatment of polycythemia vera; for neoplasms, including myelocytic leukemia; and for localizing tumors of the eye.

■ CONTRAINDICATIONS: Polycythemia vera with leukopenia or decreased platelet count, chronic myelocytic leukemia with leukopenia or erythrocytopenia, concurrent administration of other alkylating agents, or hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECT: The most serious adverse effect is radiation sickness.

sodium phosphates, a combination of monobasic and dibasic sodium phosphates used as an electrolyte replenisher.

sodium-potassium pump, a protein that transports sodium and potassium ions across cell membranes against their concentration gradients. Sodium is normally moved from the inside of the cell, where its concentration is low, to the extracellular fluid, where its concentration is much higher. Potassium is moved in the opposite direction. Energy for the pump is obtained from the hydrolysis of adenosine triphosphate. See also **calcium pump, electrolyte balance.**

sodium-restricted diet. See **low-sodium diet.**

sodium sulfate, a saline cathartic for chronic constipation caused by peristaltic disorders.

■ INDICATIONS: It is prescribed to achieve prompt, thorough evacuation of the bowel and, in lower dosage, for laxative effect.

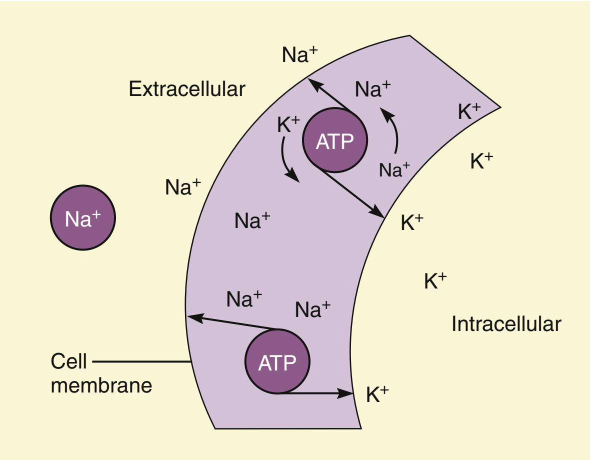
■ CONTRAINDICATIONS: Congestive heart failure, hypovolemia, or hypersensitivity to this drug prohibits its use. Frequent administration, in any dosage, is not recommended.

■ ADVERSE EFFECTS: Among the more severe adverse effects are dehydration, hypovolemia, and electrolyte imbalance.

sodium sulfate anhydrous. See **salt cake.**

sodium sulfide, the monosulfide salt of sodium, Na_2S, a flammable, highly irritating compound having a variety of industrial uses.

sodoku. See **rat-bite fever.**



Sodium-potassium pump *(Lewis et al, 2011)*

sodomist /sod′əmist/ [Sodom, biblical city in ancient Palestine], a person who practices sodomy. Also called *sodomite* /sod′əmīt/.

sodomy /sod′əmē/ [Sodom, biblical city in ancient Palestine], **1.** anal intercourse. **2.** intercourse with an animal. **3.** a vague term for "unnatural" sexual intercourse. —*sodomize, v.*

soft chancre [AS, *softe* + Fr, *canker*], a usually painless local genital ulcer that follows an infection by *Haemophilus ducreyi*. It is accompanied by suppuration of the inguinal lymphatic nodes, or inguinal buboes. Complications may include phimosis, urethral stricture or fistula, and marked tissue destruction. Also called **chancroid.**

soft contact lens (SCL) [AS, *softe* + L, *contingere* + *lens*, lentil], a contact lens made of a flexible plastic material that can be shaped more easily to fit the eyeball than a rigid gas-permeable lens and typically provides good initial comfort. Among the disadvantages of soft lenses are that they are more easily damaged, may not provide vision as sharp as alternative methods in certain cases, and must be disinfected periodically because they tend to harbor bacteria. Most contact lens patients are currently being fit into hyperoxygen-permeable silicone-hydrogel soft lenses.

soft data [AS, *softe* + L, *datum,* something given], health information that is mainly subjective, provided by the patient and the patient's family.

soft diet, a diet that is soft in texture, low in residue, easily digested, and well tolerated. It provides the essential nutrients in the form of liquids and semisolid foods, such as milk; fruit juices; eggs; cheese; custards; tapioca and puddings; strained soups and vegetables; rice; ground beef and lamb; fowl; fish; mashed, boiled, or baked potatoes; wheat, corn, or rice cereals; and breads. Omitted are raw fruits and vegetables, coarse breads and cereals, rich desserts, strong spices, all fried foods, veal, pork, nuts, and raisins. It is commonly recommended for people who have GI disturbances or acute infections and those unable to tolerate a normal diet.

softening of bones /sô′fəning, sof′əning/ [AS, *softe* + *ban*], any disease that results in a loss of the mineral content of the bones. See also **osteomalacia.**

soft fibroma, a fibroma that contains many cells. Also called **fibroma molle** /mol′ē/.

soft mechanical diet, a diet containing ground or pureed foods that are easy to chew, often eaten by people who have dental problems or are edentulous. It can contain any foods allowed in a regular diet but in an easy to chew and swallow presentation. It is sometimes inappropriately referred to as a soft diet.

soft neurological sign, a mild or slight neurological abnormality that is difficult to detect or interpret.

soft palate, the structure composed of mucous membrane, muscular fibers, and mucous glands, suspended from the posterior border of the hard palate forming the roof of the mouth. When the soft palate rises, as in swallowing and in sucking, it separates the nasal cavity and the nasopharynx from the posterior part of the oral cavity and the oral part of the pharynx. The posterior border of the soft palate hangs like a curtain between the mouth and the pharynx. Suspended from it is the conical, pendulous, palatine uvula. Arching laterally from the base of the uvula are the two curved musculomembranous pillars of the fauces. In dentistry, the soft palate serves as the anatomical landmark for construction of a maxillary full denture and establishment of a seal which helps retain the denture in the mouth. See posterior palatal seal. Compare **hard palate.**

soft radiation, a relatively long wavelength with less penetrating radiation than short wavelength radiation.

soft spot. See **anterior fontanel.**

soft tissue rheumatism. See **fibromyalgia.**

software, the programs that control a computer and cause it to perform specific functions. Compare **hardware.** See also **application.**

software bug. See **bug.**

soft water [AS, *softe* + *waeter*], water that does not contain salts of calcium or magnesium, which precipitate soap solutions.

sol, a colloidal state in which a solid is suspended throughout a liquid, such as a soap or starch in water. The fluidity of cytoplasm depends on its sol/gel balance.

sol., abbreviation for **solution.**

-sol, suffix meaning a "colloidal solution": *electrosol, nitromersol, plastisol.*

Solanaceae /sō′lənā′si·ē/, a family of plants that includes the genus *Solanum,* or nightshades, with more than 1800 species, including deadly nightshade (belladonna), henbane, tomatoes, and potatoes.

solanaceous /sō′lənā′shəs/, pertaining to plants of the Solanaceae family or substances derived from them.

solanine /sō′lə·nēn/, a steroidal alkaloid found in several species of *Solanum,* such as the nightshades and the green spots on potatoes. It causes hemolysis, central nervous system depression, and often fatal respiratory failure.

Solanum /sō·lā′nəm/ [L, nightshade], a large genus of plants of the family Solanaceae. It includes the potato, tomato, eggplant, several of the nightshades, and many poisonous and medicinal species.

solar-, prefix meaning "sun": *solarium, solarization, solarize.*

solar fever. See **dengue fever, sunstroke.**

solarium /sōler′ē·əm/ [L, terrace exposed to sun], a large, sunny room or area serving as a lounge for ambulatory patients in a hospital.

solar keratosis. See **actinic keratosis.**

solar maculopathy. See **eclipse scotoma.**

solar plexus /sō′lər/ [L, *sol,* sun, *plexus,* network], a dense network of nerve fibers and ganglia that surrounds the roots of the celiac and the superior mesenteric arteries at the level of the first lumbar vertebra. It is one of the great autonomic plexuses of the body in which the nerve fibers of the sympathetic system and the parasympathetic system combine. The denser part of the solar plexus lies between the suprarenal glands, on the ventral surface of the crura of the diaphragm and on the abdominal aorta. Also called **celiac plexus.**

solar radiation, the emission and diffusion of actinic rays from the sun. Overexposure may result in sunburn, keratosis, skin cancer, accelerated aging, or lesions associated with photosensitivity.

solar retinopathy. See **eclipse scotoma.**

solar sneeze reflex [L, *sol,* sun; ME, *snesen* + L, *reflectere,* to bend back], a sneeze that may be caused by exposure to bright sunlight.

solar therapy [L, *sol,* sun; Gk, *therapeia,* treatment], the therapeutic use of sunlight. Also called **heliotherapy.**

solder /sod′ər/ [L, *solidatio,* making solid], **1.** *n,* a fusible metal or alloy used to unite pieces of metals with higher fusion temperatures. **2.** *v,* to fasten together pieces of metal through the use of this material.

sole [L, *solea,* sole of foot], the plantar surface of the foot.

soleus /sō′lē·əs/ [L, *solea,* sole of foot], one of three superficial posterior muscles of the leg. It is a broad, flat muscle lying just under the gastrocnemius. The fibers of the soleus merge near the middle of the leg with those of the gastrocnemius to form the tendo calcaneus, which inserts into the calcaneus of the foot. The soleus plantar flexes the foot. Compare **gastrocnemius, plantaris.**

soleus pump. See **calf muscle pump.**

Solganal, a trademark for a gold salt antirheumatic **(aurothioglucose).**

solid /sol′id/ [L, *solidus*], **1.** *n,* a dense body, figure, structure, or substance that has length, breadth, and thickness, is not a liquid or a gas, contains no significant cavity or hollowness, and has no breaks or openings on its surface. **2.** *adj,* describing such a body, figure, structure, or substance.

solifenacin, an anticholinergic.

■ INDICATION: This drug is used to treat overactive bladder.

■ CONTRAINDICATIONS: Uncontrolled narrow-angle glaucoma, urinary retention, gastric retention, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include anxiety, paresthesia, fatigue, headache, chest pain, hypertension, abdominal pain, dry mouth, dyspepsia, dysuria, urinary retention and frequency, urinary tract infection, rash, pruritus, bronchitis, cough, pharyngitis, and upper respiratory tract infection. Common side effects include dizziness, vision abnormalities, xerophthalmia, nausea, vomiting, anorexia, and constipation.

Soliris, a trademark for **eculizumab.**

solitary coin lesion /sol′iter′ē/ [L, *solitarius,* standing alone, *cuneus,* wedge, *laesus,* injury], a nodule identified on a chest radiographic film by clear normal lung tissue surrounding it. A coin lesion is often malignant.

solitary play, a form of play among a group of children within the same room or area in which each child engages in an independent activity using toys that are different from the toys of the others, concentrating solely on the particular activity, and showing no interest in joining in or interfering with the play of others. Compare **cooperative play.** See also **associative play, parallel play.**

soln, abbreviation for **solution.**

solubility /sol′yəbil′itē/ [L, *solubilis,* able to dissolve], **1.** the maximum amount of a solute that can dissolve in a specific solvent under a given temperature and pressure. **2.** the concentration of a solute in a solvent at its saturation point. —*soluble, adj.*

solubility coefficient. See **coefficient.**

-soluble, suffix meaning "able to be dissolved": *acetosoluble, hydrosoluble, liposoluble.*

soluble amyloid beta protein precursor test, a test for a decrease in levels of beta amyloid in cerebrospinal fluid, used in the diagnosis of Alzheimer's disease and other forms of senile dementia.

Solu-Cortef, a trademark for a glucocorticoid **(hydrocortisone sodium succinate).**

Solu-Medrol, a trademark for a glucocorticoid (methylprednisolone sodium succinate).

solute /sol′yo͞ot, sō′lo͞ot/ [L, *solutus,* dissolved], a substance dissolved in a solution.

solution (sol., soln) /səlo͞o′shən/ [L, *solutus*], a mixture of one or more substances dissolved in another substance. The molecules of each of the substances disperse homogenously and do not change chemically. A solution may be a gas, a liquid, or a solid. Compare **colloid, suspension.** See also **solute, solvent.**

-solve, suffix meaning "to loosen": *dissolve, resolve.*

solvent /sol′vənt/ [L, *solvere,* to dissolve], **1.** any liquid in which another substance can be dissolved. **2.** *(informal)* an organic liquid, such as benzene, carbon tetrachloride, and other volatile petroleum distillates, that when inhaled can cause intoxication as well as damage to mucous membranes of the nose and throat and the tissues of the kidney, liver, and brain. Repeated, prolonged exposure can result in addiction, brain damage, blindness, and other serious consequences, some of them fatal. See also **benzene poisoning, carbon tetrachloride poisoning, glue sniffing, petroleum distillate poisoning.**

som-, prefix for growth hormone derivatives.

soma /sō′mə/ *pl.* **somas, somata** [Gk, body], **1.** the body, as distinguished from the mind or psyche. **2.** the body, excluding germ cells. **3.** the body of a cell. —**somal, somatic,** *adj.*

Soma, a trademark for a skeletal muscle relaxant **(carisoprodol).**

soma-. See **somato-.**

somal, somas, somata. See **soma.**

-soma, -somus, suffix meaning a "body or part of a body": *hystersoma, microsoma, prosoma, pleurosomus, hemisomus.*

-somatia, -somatic, suffix meaning "body": *diplosomatia, exsomatic, macrosomatia, microsomatia.*

somatic. See **psychosomatic, soma.**

-somatic. See **-somatia.**

somatic cavity. See **coelom.**

somatic cell /sōmat′ik/, any of the cells of body tissue that have the diploid number of chromosomes, as distinguished from germ cells, which contain the haploid number. Compare **germ cell.**

somatic-cell gene therapy. See **gene therapy.**

somatic chromosome, any autosome in a diploid or somatic cell.

somatic delusion, a false notion or belief concerning body image or body function. See also **delusion.**

somatic effects, radiation effects such as cancer that occur in the exposed individual, as opposed to genetic effects, which occur in the individual's offspring.

somatic mutation [Gk, *soma,* body; L, *mutare,* to change], a sudden change in the chromosomal material in somatic cell nuclei affecting derived cells but not offspring.

somatic pain, generally well-localized pain that results from the activation of peripheral nociceptors without injury to the peripheral nerve or central nervous system.

somatic therapy, a form of treatment pertaining to the body that affects one's physiological functioning.

somatist /sō′mətist/, a psychotherapist or other health professional who believes that every neurosis and psychosis has an organic cause.

somatization /sō′mətīzā′shən/ [Gk, *soma,* body], a process whereby a mental event is expressed in a body disorder or physical symptom. Examples include peptic ulcers and asthma. See also **conversion.**

somatization disorder [Gk, *soma* + *izein,* to cause], a *DSM-IV* psychiatric disorder characterized by recurrent multiple physical complaints and symptoms for which there is no organic cause. It is classified as a somatoform disorder in *DSM-IV.* The condition typically begins in adolescence or in the early adult years and is less common in men. The symptoms vary according to the individual and the underlying emotional conflict. Some common symptoms are GI dysfunction, paralysis, temporary blindness, cardiopulmonary distress, painful or irregular menstruation, sexual indifference, and pain during intercourse. Hypochondriasis may develop if the condition is untreated. Also called **Briquet's syndrome.** See also **conversion disorder.**

somatodyspraxia /-disprak′sē·ə/, an impairment in the ability to plan skilled movements that are nonhabitual. Patients may be able to learn specific motor skills with practice but cannot accomplish unfamiliar tasks.

somatoform disorder /sōmat′əfôrm, sō′mətōfôrm′/ [Gk, *soma* + L, *forma,* form], any of a group of disorders characterized by symptoms suggesting physical illness or disease for which there are no demonstrable organic causes or physiological dysfunctions. The symptoms are usually the physical manifestations of some unresolved intrapsychic factor or conflict. Kinds of somatoform disorders are **conversion disorder, hypochondriasis, psychogenic pain disorder,** and **somatization disorder.**

somatogenesis /sō′matəjen′əsis/ [Gk, *soma* + *genein,* to produce], **1.** in embryology, the development of the body from the germ plasm. **2.** the development of a physical disease or symptoms from an organic pathophysiological cause. Compare **psychogenesis.** —*somatogenetic, somatogenic, adj.*

somatoliberin. See **growth hormone–releasing hormone.**

somatomedin. See **growth hormone.**

somatomedin C. See **insulin-like growth factor.**

somatomedin-C test, a blood test most commonly used to detect levels of somatomedin-C, also called insulin-like growth factor. Screening for somatomedin-C provides an accurate reflection of the mean plasma concentration of growth hormone.

somatomegaly /sō′matōmeg′əlē/ [Gk, *soma* + *megas,* large], a condition in which the body is abnormally large as a result of an excessive secretion of somatotropin or an inadequate secretion of somatostatin.

somatoplasm /sô′mətōplaz′əm/ [Gk, *soma* + *plasma,* something formed], the nonreproductive protoplasmic material of the body cells, as distinguished from the reproductive material of the germ cells. Compare **germ plasm.**

somatopleure /sô′mətōplo͝or′/ [Gk, *soma* + *pleura,* side], the lateral and ventral tissue layer that forms the body wall of the early developing embryo. Consisting of an outer layer of ectoderm lined with somatic mesoderm, it continues as the amnion and chorion external to the embryo. Compare **splanchnopleure.** —*somatopleural, adj.*

somatosensory evoked potential (SEP) /-sen′sərē/ [Gk, *soma* + L, *sentire,* to feel], evoked potential elicited by repeated stimulation of the pain and touch systems. It is the least reliable of the evoked potentials studied as monitors of neurological function during surgery.

somatosensory system, the components of the central and peripheral nervous systems that receive and interpret sensory information from organs in the joints, ligaments, muscles, and skin. This system processes information about the length, degree of stretch, tension, and contraction of muscles; pain; temperature; pressure; and joint position.

somato-, soma-, prefix meaning "body": *somatoceptor, somatogenic, somatopleural.*

somatosplanchnic /-splangk′nik/ [Gk, *soma* + *splanchna,* viscera], pertaining to the trunk of the body and the viscera.

somatostatin /sō′matōstat′in/, a hormone produced in the hypothalamus that inhibits the release of somatotropin (growth hormone) from the anterior pituitary gland. It also is produced in other parts of the body and inhibits the release of certain other hormones, including thyrotropin, adrenocorticotropic hormone, glucagon, insulin, and cholecystokinin, and of some enzymes, including pepsin, renin, secretin, and gastrin. Also called **growth hormone release inhibiting hormone.**

somatotherapy /-ther′əpē/, the treatment of physical disorders, as distinguished from psychotherapy.

somatotropic /-trop′ik/ [Gk, *soma,* body, *trope,* a turn], pertaining to an agent that influences the body or body cells.

somatotropic hormone, somatotropin. See **growth hormone.**

somatotropin-releasing hormone. See **growth hormone–releasing hormone.**

somatotype /sō′mətōtīp′/ [Gk, *soma* + *typos,* mark], **1.** body build or physique. **2.** the classification of individuals according to body build on the basis of certain physical characteristics. The primary types are **ectomorph, endomorph,** and **mesomorph.**

somatovisceral reflex /-vis′ərəl/, a reflex in which visceral functions are activated or inhibited by somatic sensory stimulation.

somatrem /sō′mətrem/, a synthetic polypeptide growth hormone produced by recombinant deoxyribonucleic acid technology.

■ INDICATIONS: It is prescribed for growth promotion when patients are not growing because of limited endogenous growth hormone secretion. It is also used to limit cachexia in AIDS patients undergoing antiretroviral treatment and as replacement therapy in adults with documented growth hormone deficiency.

■ CONTRAINDICATIONS: It is contraindicated for pediatric patients with closed epiphyses and for patients with evidence of underlying intracranial lesions, widespread trauma/multiple organ failure, or malignancy. Concurrent use with a glucocorticoid may inhibit the effects of somatrem.

■ ADVERSE EFFECTS: Among reported adverse effects are insulin resistance and hypothyroidism. The adverse effects of somatrem tend to vary with the underlying indication for its use.

Somatuline Depot, a trademark for **lanreotide.**

Somavert, a trademark for **pegvisomant.**

-some, suffix meaning "a body" of a specified sort: *chromosome, microsome, sarcosome.*

-somia, suffix meaning "(condition of) possessing body": *agenosomia, diplosomia, microsomia.*

somite /sō′mīt/ [Gk, *soma,* body], any of the paired segmented masses of mesodermal tissue that form along the length of the neural tube during the early stage of embryonic development in vertebrates. These structures give rise to the vertebrae and differentiate into various tissues of the body, including the voluntary muscle, bones, connective tissue, and dermal layers of the skin. The first somite to appear is in the future occipital region, and the formation of new somites continues in a caudal direction until 36 to 38 have developed.

somite embryo, an embryo in any stage of development between the formation of the first and the last pairs of somites, which in humans occurs in the third and fourth weeks after fertilization of the ovum.

somn-. See **somni-.**

somnambulism /somnam′byəliz′əm/ [L, *somnus,* sleep, *ambulare,* to walk], **1.** also called **noctambulation, sleepwalking,** *somnambulance.* a condition occurring during stage

3 or 4 of nonrapid eye movement sleep that is characterized by complex motor activity, usually culminating in leaving the bed and walking about. The person has no recall of the episode on awakening. The episodes, which usually last from several minutes to half an hour or longer, are seen primarily in children, are more common in boys than in girls, and are more likely to occur if the individual is fatigued or under stress or has taken a sedative or hypnotic medication at bedtime. Seizure disorders, central nervous system infections, and trauma may be predisposing factors, but the condition is more commonly related to anxiety. In adults, the condition is less common and is classified as a dissociative reaction. **2.** a hypnotic state in which the person has full possession of the senses but no recollection of the episode. See also **fugue.**

somni-, somn-, prefix meaning "sleep": *somnifacient, somniferous, somnipathy.*

-somnia, suffix meaning "(condition of or like) sleep": *asomnia, hyposomnia, hypersomnia.*

somniloquence /somnil′əkwəns/, talking during sleep or under hypnosis.

somnolent /som′nələnt/ [L, *somnolentia,* sleepy], **1.** the condition of being sleepy or drowsy. **2.** tending to cause sleepiness. **—***somnolence, n.*

somnolent detachment, (in psychology) a term introduced by H.S. Sullivan for a type of security operation in which a person falls asleep when confronted by a highly threatening, anxiety-producing experience. The mechanism originates in infancy.

Somogyi effect (phenomenon) [Michael Somogyi, American biochemist, 1883–1971; Gk, *phainomenon*], a diabetes mellitus rebound effect in which an overdose of insulin induces hypoglycemia. This releases hormones that stimulate lipolysis, gluconeogenesis, and glycogenolysis, leading to hyperglycemia and ketosis. Treatment involves gradually lowering the insulin dose to achieve an optimal level.

-somus. See **-soma.**

son-, prefix meaning "sound": *sonitus, sonometer, sonotone.*

Sonata /so-nah′tah/, a trademark for a preparation of **zaleplon,** used to treat insomnia.

sonic scaler, in dentistry, an electromagnetic or compressed air-driven mechanized instrument used to remove calculus, bacterial biofilms, and root surface accretions. Various sized and shaped tips may be placed into the handpiece in order to reach various areas of the tooth and root surface. Compare **ultrasonic scaler.**

sonographer /sōnog′rəfər/, an allied health professional with special training in the use of ultrasound equipment for diagnostic and therapeutic purposes. Also called **diagnostic medical sonographer, medical sonographer, ultrasonographer.**

sonography. See **ultrasonography.**

sonorant. See **voiced.**

soot wart. See **scrotal cancer.**

sopor /sō′pər/ [L, deep sleep], a sleep that is as deep or sound as the state of stupor.

soporiferous /sop′ərif′ərəs/ [L *sopor,* deep sleep, *ferre,* to bear], tending to cause deep sleep, such as an agent that induces deep sleep.

soporific /sop′ərif′ik/ [L, *sopor,* deep sleep, *facere,* to make], **1.** *adj,* pertaining to a substance, condition, or procedure that causes sleep. **2.** *n,* a soporific drug. See also **hypnotic, sedative.**

sorafenib, a miscellaneous antineoplastic.

■ INDICATIONS: This drug is used to treat advanced and metastatic murine renal cell carcinoma.

■ CONTRAINDICATIONS: Pregnancy and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, weight loss, headache, anorexia, mouth ulceration, abdominal pain, constipation, pruritus, erythema, hand-foot rash, acne, flushing, and alopecia. Life-threatening side effects include hypertension, cardiac ischemia, infarction, pancreatitis, hemorrhage, leukopenia, lymphopenia, anemia, neutropenia, thrombocytopenia, and exfoliative dermatitis. Common side effects include nausea, diarrhea, vomiting, dry skin, hypophosphatemia, arthralgia, myalgia, and hoarseness.

sorbent /sôr′bənt/ [L, *sorbere,* to swallow], **1.** *n,* an agent that attracts and retains substances by absorption or adsorption. **2.** *adj,* the property of a substance that allows it to interact with another compound, usually to make it bind.

sorbic acid /sôr′bik/, a compound occurring naturally in berries of the mountain ash. Commercial sorbic acid derived from acetaldehyde is used in fungicides, food preservatives, lubricants, and plasticizers.

Sorbitrate, a trademark for an antianginal **(isosorbide dinitrate).**

sordes /sôr′dēz/ *pl.* **sordes** [L, *sordere,* to be dirty], dirt or debris, especially the crusts consisting of food, microorganisms, and epithelial cells that accumulate on teeth and lips during a febrile illness or one in which the patient takes nothing by mouth. Sordes gastricae is undigested food and mucus in the stomach.

sore /sôr, sōr/ [AS, *sar*], **1.** *n,* a wound, ulcer, or lesion. **2.** *adj,* tender or painful.

sore throat [AS, *sar* + *throte*], any inflammation of the larynx, pharynx, or tonsils.

Sorrin's operation, a surgical technique for treating a periodontal abscess, used especially when the marginal gingiva appears healthy and provides no access to the abscess. A semilunar incision is made below the abscess area in the attached gingiva, leaving the gingival margin undisturbed. The tissue flap produced by the incision is raised, accessing the abscessed area for curettage, after which the wound is sutured.

s.o.s., abbreviation for the Latin phrase *si opus sit,* "if necessary."

sotalol /so′tah-lol/, a noncardioselective beta-adrenergic blocking agent, used as the hydrochloride salt in treatment of life-threatening ventricular arrhythmias.

Soto's syndrome. See **cerebral gigantism.**

souffle /so͞o′fəl/ [Fr, breath], a soft murmur heard through a stethoscope. When detected over the uterus in a pregnant woman, it is usually coincident with the maternal pulse and is caused by blood circulating in the large uterine arteries.

soul food [AS, *sawel* + *foda*], an American cuisine typically associated with African-Americans of the southern United States.

sound [L, *sub,* under, *unde,* wave], an emission detected by an instrument used to locate the opening of a cavity or canal, to test the patency of a canal, to ascertain the depth of a cavity, or to reveal the contents of a canal or cavity. A sound is used to determine the depth of the uterus, to detect stones in the bladder, and, less commonly, to assist in correctly inserting a urinary catheter in the urethra through the urinary meatus.

sounds of Korotkoff. See **blood pressure.**

sound waves, longitudinal waves of mechanical energy that transmit the vibrations interpreted as sound.

Souques's sign /so͞oks/ [Alexandre A. Souques, French neurologist, 1860–1944], in patients with a disease of the corpus striatum, the failure of a seated patient to extend the legs when the chair is pushed backward. The legs normally would be extended to prevent overbalancing. Also called **Souques's phenomenon.**

source-to-image-receptor distance (SID) /sôrs, sōrs/ [OFr, *sourse,* origin; L, *imago,* likeness], the distance between the focal spot on the target of an x-ray tube and the image receptor as measured along the beam.

South African genetic porphyria. See **variegate porphyria.**

South American blastomycosis. See **paracoccidioidomycosis.**

South American trypanosomiasis. See **Chagas' disease.**

Southern blot test /suth′ərn/, a gene analysis method used in identification of specific deoxyribonucleic acid (DNA) fragments and in diagnosis of cancers and hemoglobinopathies. It involves the placement of a nitrocellulose film on agarose gel surfaces, with dry blotting material on the film. Liquid is then transported from a reservoir beneath the gel through the gel and nitrocellulose layer. The film adsorbs the DNA fragments. The fragments are then analyzed for rearrangements in immunoglobulin or cell receptor genes, chromosomal translocations, oncogene amplifications, and point mutations within oncogenes. Immunoglobulins and T cell receptor genes bear signatures that identify various leukemias and lymphomas. See also **Northern blot test.**

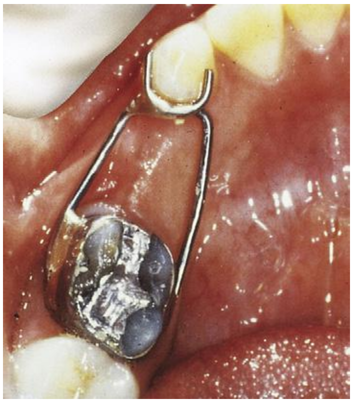
Sp, sp., spp., abbreviation for **species.**

SPA, abbreviation for **sperm penetration assay.**

space [L, *spatium*], an area, region, or segment of the body, such as the complemental spaces in the pleural cavity that are not occupied by lung tissue and the lymph spaces occupied by lymph.

space adaptation syndrome, the ability to accommodate changes in cardiac function, bone mineral changes, and muscle atrophy while in the weightless state of a space traveler.

space maintainer, a fixed or removable appliance for preserving the space created by the premature loss of one or more teeth. It can be unilateral or bilateral. Types include band-loop, crown-loop, and lingual arch. See also **separator.**



Space maintainer *(Bird and Robinson, 2005)*

space medicine, a branch of medicine concerned with the effects of travel in space, beyond the atmosphere and pull of gravity, including weightlessness, motion sickness, and restricted physical activity.

space obtainer, an appliance for increasing the space between adjoining teeth.

spacer /spās′ər/ [L, *spatium,* space], on a metered dose inhaler, a chamber between the inhaler canister and the patient's mouth where droplets of medication can slow down and evaporate so that there is less direct impact on the oropharynx, with more medication delivered to the lower respiratory tract instead of being lost in the mouth. This is especially helpful for children. See also **metered dose inhaler.**

Metered dose inhaler with spacer *(Potter et al, 2011)*

space regainer, a fixed or removable appliance for moving a displaced secondary tooth into its normal position in a dental arch.

space sickness. See **air sickness.**

Spanish fly. See **cantharis.**

spano-, prefix meaning "scanty or scarce": *spanogyny, spanomenorrhea, spanopnea.*

sparfloxacin, an antiinfective.

■ INDICATIONS: It is used to treat community-acquired pneumonia and chronic bronchitis caused by *Klebsiella pneumoniae, Haemophilus influenzae, H. parainfluenzae,* and *Moraxella catarrhalis.*

■ CONTRAINDICATIONS: Known hypersensitivity to quinolones and photosensitivity prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are leukopenia and pseudomembranous colitis. Other adverse effects are eosinophilia, anemia, flatulence, diarrhea, QT interval prolongation, vasodilation, rash, pruritus, and photosensitivity. Common side effects are headache, dizziness, insomnia, nausea, vomiting, and abdominal pain.

sparganosis /spär′gənō′sis/ [Gk, *sparganon,* swaddling clothes, *osis,* condition], an infection with larvae of the fish tapeworm of the pseudogenus Sparganum, recently identified as the plerocercoid stage of *Diphyllobothrium.* It is characterized by painful subcutaneous swellings or swelling and destruction of the eye. It is acquired by ingesting larvae in contaminated water or in inadequately cooked infected frog flesh. Treatment includes surgery and local injection of ethyl alcohol to kill the larvae.

Sparine, a trademark for a phenothiazine antipsychotic and antiemetic (promazine hydrochloride).

spasm /spaz′əm/ [Gk, *spasmos*], **1.** an involuntary muscle contraction of sudden onset, such as habit spasms, hiccups, stuttering, or a tic. **2.** a convulsion or seizure. **3.** a sudden transient constriction of a blood vessel, bronchus, esophagus, pylorus, ureter, or other hollow organ. Compare **stricture.** See also **bronchospasm, pylorospasm.**

-spasm, suffix meaning "twitching or involuntary contraction" of a specified sort: *gastrospasm, neurospasm, vasospasm.*

spasmatic croup. See **laryngismus stridulus.**

spasmo-, prefix meaning "spasms": *spasmodermia, spasmophemia, spasmophilia.*

-spasmodic, -spasmodical, suffix meaning "convulsion": *angiospasmodic, antispasmodic, postspasmodic.*

spasmodic asthma /spazmäd′ik/ [Gk, *spasmos* + *asthma,* panting], an airway obstruction caused by spasms of the bronchioles and inflammation of the bronchial mucosa and characterized by paroxysms of wheezing and coughing.

spasmodic croup. See **laryngismus stridulus.**

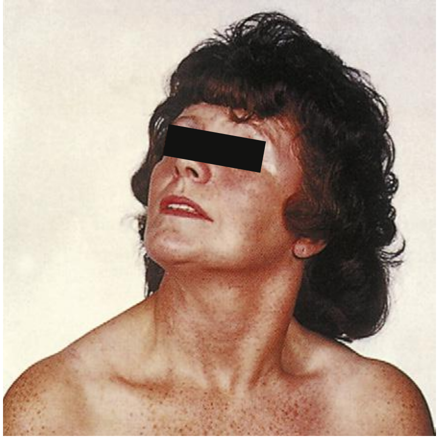
spasmodic dysmenorrhea /spazmod′ik/, difficult menstruation accompanied by painful contractions of the uterus.

spasmodic dysphonia [Gk, *spasmodes,* spasms, *dys,* bad, *phone,* voice], a speech disorder in which phonation is intermittently blocked by larynx spasms. The cause can be organic. Also called **spastic dysphonia.**

spasmodic stricture [Gk, *spasmodes* + L, *strictura,* compression], a narrowing of a passage in which there is no organic change, merely muscle spasms.

spasmodic tic [Gk, *spasmodes* + Fr, *tic*], any repetitive movement in which spasmodic muscle group contractions occur at variable intervals.

spasmodic torticollis [Gk, *spasmodes* + L, *tortus,* twisted, *collum,* neck], a condition in which the head is inclined to one side as a result of episodes of spasms of the neck muscles. It is often transient, and examination seldom reveals a physical cause. In some cases, it may be brought on by severe stress.



Spasmodic torticollis: characteristic head posture

(Perkin et al, 2011)

spasmogen /spaz′məjən/, any substance that can produce smooth muscle contractions, as in the bronchioles. Examples are histamine, bradykinin, and serotonin.

spastic /spas′tik/ [Gk, *spastikos,* drawing in], pertaining to spasms or other uncontrolled contractions of the skeletal muscles. See also **cerebral palsy. —spasticity,** *n.*

spastic aphonia, a condition in which a person is unable to speak because of spasmodic contraction of the abductor muscles of the throat. See also **aphonia.**

spastic bladder, a form of neurogenic bladder caused by a lesion of the spinal cord above the voiding reflex center. It is marked by loss of bladder control and bladder sensation; incontinence; and automatic, interrupted, incomplete voiding. It is most often caused by trauma but may result from a tumor or multiple sclerosis. Also called **automatic bladder, reflex bladder.** Compare **flaccid bladder.**

spastic colon. See **irritable bowel syndrome.**

spastic constipation [Gk, *spasmos,* spasm; L, *constipare,* to crowd together], a form of constipation associated with neurasthenia and constrictive spasms in part of the intestine. The condition may be a sign of lead poisoning.

spastic diplegia, paralysis of corresponding parts on both sides of the body. See also **cerebral palsy.**

spastic dysarthria, a type of motor speech disorder affecting speech articulation, caused by lesions of the corticobulbar tracts. It affects strength, speed, precision, range of motion, and coordination of speech musculature movements.

spastic dysphonia. See **spasmodic dysphonia.**

spastic dysuria, difficulty in urination caused by bladder spasms.

spastic entropion, entropion that arises from excessive contracture of the orbicularis oculi muscle. See also **entropion.**

spastic gait [Gk, *spasmos,* spasm; ONorse, *gata*], a pattern of walking in which the legs are stiff, the feet are plantar-flexed, and movements are made by circumduction. The steps also may be accompanied by toe dragging.

spastic hemiplegia, paralysis of one side of the body with increased tendon reflexes and uncontrolled contraction occurring in the affected muscles.

spastic ileus [Gk, *spasmos,* spasm, *eilein,* to twist], a form of intestinal obstruction caused by bowel spasms.

spasticity /spastis′itē/ [Gk, *spastikos,* drawing in], a form of muscular hypertonicity with increased resistance to stretch. It usually involves the flexors of the arms and the extensors of the legs. The hypertonicity is often associated with weakness, increased deep reflexes, and diminished superficial reflexes. Moderate spasticity is characterized by movements that require great effort and lack of normal coordination. Slight spasticity may be marked by gross movements that are coordinated smoothly but combine selective movement patterns that are uncoordinated or impossible.

spastic paralysis, an abnormal condition characterized by the involuntary contraction of one or more muscles with associated loss of muscular function. Compare **flaccid paralysis.**

spastic paraplegia [Gk, *spasmos,* spasm, *para* + *plege,* stroke], a form of partial paralysis mainly affecting older people. It is accompanied by irritability and spastic contractions of the leg muscles.

spastic primary paraplegia. See **primary lateral sclerosis.**

spastic pseudoparalysis, spastic pseudosclerosis. See **Creutzfeldt-Jakob disease.**

spastic strabismus [Gk, *spasmos* + *strabismos,* squint], squint caused by spasmodic contractions of ocular muscles.

spatial dance /spā′shəl/ [L, *spatium,* space; ME, *dauncen,* to drag along], the body shifts or movements used by individuals as they try to adjust the distance between themselves and other individuals. See also **spatial zones.**

spatial relationships, **1.** orientation in space; the ability to locate objects in the three-dimensional external world by using visual or tactile recognition and to make a spatial analysis of the observed information. Spatial orientation normally is a function of the right hemisphere of the brain. **2.** the relative locations of staff and equipment in an operating room with particular emphasis on what is sterile, clean, or contaminated. The operating room nurse must maintain an awareness of the arrangement of people and the proximity of sterile to nonsterile areas.

spatial resolution, the ability of an imaging system to discriminate between two adjacent high-contrast objects.

spatial summation. See **summation,** def. 2.

spatial zones, the areas of personal space in which most people interact. Four basic spatial zones are the intimate zone, in which distance between individuals is less than 18 inches; the personal zone, between 18 inches and 4 feet; the social zone, extending between 4 and 12 feet; and the public zone, beyond 12 feet. See also **proxemics.**

spatula /spach′ə·lə/ [L], **1.** a flat, blunt, usually flexible instrument used for spreading plasters and for mixing ointments, cements, impression materials, and masses. **2.** a structure having a flat, blunt end.

SPCA, abbreviation for *serum prothrombin conversion accelerator* (factor VII, one of the coagulation factors).

SPE, abbreviation for **sucrose polyester.**

speaking valve, a one-way valve placed on the end of a cuffless, deflated tracheostomy tube to facilitate normal speech. See Passy-Muir valve

Spearman's rho /spir′mənz rō′/ [Charles E. Spearman, English psychologist, 1863–1945; *rho,* 17th letter in the Greek alphabet], a statistical test for correlation between two rank-ordered scales. It yields a statement of the degree of interdependence of the scores of the two scales.

special care unit /spesh′əl/ [L, *specialis,* individual], a hospital unit with the necessary specialized equipment and personnel for handling critically ill or injured patients, such as a neonatal, burn unit, or cardiac care unit.

special gene system, a plasmid, transposon, or other DNA fragment that is able to transfer genetic information from one cell to another.

specialing /spesh′əling/, *informal.* **1.** (in psychiatric nursing) the constant attendance of a professional staff member on a disturbed patient to protect the patient from harming the self or others and to observe the patient's behavior. The patient so cared for is accompanied in all activities by the staff member. **2.** (in nursing) the giving of nursing care to only one person, such as that given by a private duty nurse or a nurse caring for a patient whose needs are so great that the nurse is required at all times.

specialist /spesh′əlist/, a health care professional who practices a specialty. A specialist usually has advanced clinical training and may have a postgraduate academic degree.

specialist in blood bank technology. See **blood bank technology specialist.**

special sense, the sense of sight, smell, taste, touch, or hearing.

specialty /spesh′əltē/ [L, *specialis*], a branch of medicine or nursing in which the professional is specially qualified to practice by having attended an advanced program of study, passed an examination given by an organization of the members of the specialty, or gained experience through extensive practice in the specialty.

specialty care, specialized medical services provided by a physician specialist.

species (Sp) /spē′sēz, spē′shēz/ *pl.* **species (sp., spp.)** [L, form], the category of living things below genus in rank. A species is a genetically distinct group of demes that share a common gene pool and are reproductively isolated from all other such groups. See also **deme, genus.**

species immunity, a form of natural immunity shared by all members of a species. Compare **individual immunity, racial immunity.**

species-specific [L, *specere,* to see, *facere,* to make], **1.** characteristic of a particular species. **2.** having a characteristic effect on, or interaction with, cells, tissues, or membranes of a particular species, said of an antigen, drug, or infective agent.

species-specific antigen, an antigen that is restricted to a single species but occurs in all members of that species.

species specificity. See **specificity.**

specific absorption rate (SAR) /spisif′ik/ [L, *species,* form], (in hyperthermia treatment) the rate of absorption of heat energy (W) per unit mass of tissue in units of watts per kilogram (W/kg).

specific activity, **1.** the radioactivity of a radioisotope per unit mass of the element or compound, expressed in microcuries per millimole or disintegrations per second per milligram. **2.** the relative radioactivity per unit mass, expressed as counts per minute per milligram. For example, the specific activity of potassium in the human body is the same as that in the environment or diet. Because potassium is associated chiefly with muscle tissue, a whole-body count of 40K, after administration of radioactive potassium, can be used to distinguish lean body mass from total body mass.

specific disease, a disorder caused by a special pathogenic organism.

specific granule, a secondary granule in the cytoplasm of polymorphonuclear leukocytes that contains lysozyme, vitamin B_{12}-binding protein, neutral proteases, and lactoferrin.

specific granule deficiency, an immunodeficiency state associated with pyodermas and abscesses in which neutrophils fail to make specific granules. See also **specific granule.**

specific gravity (sp. gr.), the ratio of the density of a substance to the density of another substance accepted as a standard. The usual standard for liquids and solids is water. Thus a liquid or solid with a specific gravity of 4 is four times as dense as water at the same temperature. Hydrogen is the usual standard for gases. See also **density, mass.**

specific immunoglobulin, a preparation obtained from human plasma that is preselected for its high antibody count against a specific pathogen, such as varicella zoster virus.

specificity /spes′əfis′itē/ [L, *species,* form, *facere,* to make], the quality of being distinctive. Kinds of specificity may include **group, species,** and **type.** See also **diagnostic specificity.**

specificity of association, the uniqueness of a relationship between a causal factor and the occurrence of a disease.

specific rates, statistical rates in which the events in both the numerator and the denominator are restricted to a specific subgroup of a population.

specific treatment. See **treatment.**

specific ulcer [L, *species, facere,* to make, *ilcus*], ulcer associated with a specific disease, as a syphilitic ulcer.

specific viscosity [L, *species* + *facere,* to make, *viscosus,* sticky], the internal friction of a fluid, which may be measured by comparing the rate of flow of the fluid through a tube with the rate of a standard liquid under standard conditions.

specimen /spes′imən/ *pl.* **specimens** [L, *specere,* to look], a small sample of something intended to show the nature of the whole, such as a urine specimen.

specimen management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as obtaining, preparing, and preserving a specimen for a laboratory test. See also **Nursing Interventions Classification.**

specimens. See **specimen.**

speckled dystrophy of the cornea /spek′əlt/, a familial condition characterized by irregular mottling of the cornea by spots that vary in shape and size, some with clear centers and sharp margins.

speckled pattern, an immunofluorescence pattern produced when serum from a patient with a particular connective tissue disease is placed in contact with human epithelial cells and stained with fluorochrome-labeled animal antisera. Fine, coarse, or large speckles are observed in disorders such as lupus erythematosus and rheumatoid arthritis.

SPECT, abbreviation for **single-photon emission computed tomography.**

SPECTamine, a trademark for a lipid-soluble brain-imaging agent (iofetamine hydrochloride ^{123}I).

spectator ions /spek′tātər/, ions that are not involved in a chemical reaction. They may be deleted when writing the equation ionically.

Spectazole, a trademark for an antifungal (econazole nitrate).

spectinomycin hydrochloride /spek′tinōmī′sin/, an antibiotic.

■ INDICATIONS: It is prescribed in the treatment of gonorrhea and certain infections in penicillin-allergic patients.
■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.
■ ADVERSE EFFECTS: The more serious adverse effects are oliguria, urticaria, chills, fever, dizziness, and nausea.

spectr-, prefix meaning "image": *spectrograph, spectrophobia, spectrum.*

spectra. See **spectrum.**

spectro-, prefix meaning relationship to a spectrum or to an image.

Spectrocin, a trademark for a fixed-combination topical drug containing antibacterials (neomycin bacitracin and polymyxin B) and a local anesthetic (lidocaine).

spectrometer /spektrom′ətər/ [L, *spectrum,* image; Gk, *metron,* measure], an instrument for measuring wavelengths of rays of a spectrum, the deviation of refracted rays, and the angles between faces of a prism. See also **mass spectrometer, Mössbauer spectrometer.**

spectrometry /spektrom′ətrē/, the process of measuring wavelengths of light and other electromagnetic waves. See also **spectrometer.** —*spectrometric, adj.*

spectrophotometric. See **spectrophotometry.**

spectrophotometric analysis. See **quantitative analysis.**

spectrophotometry /spek′trōfətom′ətrē/, the measurement of color in a solution by determining the amount of light absorbed in the ultraviolet, infrared, or visible spectrum, widely used in clinical chemistry to calculate the concentration of substances in solution. —**spectrophotometric,** *adj.*

spectroscope /spek′trə·skōp/ [L, *spectrum,* spectrum; Gk, *skopein,* to examine], an instrument for developing and analyzing spectra.

spectroscopy /spek·tros′kə·pē/ [L, *spectrum,* spectrum; Gk, *skopein,* to examine], the propagation and analysis of spectra; examination by means of a spectroscope.

spectrum /spek′trəm/ *pl.* **spectra** [L, image], **1.** a range of phenomena or properties occurring in increasing or decreasing magnitude. Radiant or electromagnetic energy is arranged on the basis of wavelength and frequency. Electromagnetic radiation includes spectra of radio waves, infrared waves, visible light, ultraviolet waves, x-rays, and gamma rays. See also **electromagnetic radiation, wave. 2.** the range of effectiveness of an antibiotic. A broad-spectrum antibiotic is effective against a wide range of microorganisms. See also **antibiotic.**

specular reflection, a reflection from a smooth surface, such as a mirror. In ultrasonography, such reflections are from smooth surfaces such as organ walls.

speculum /spek′yələm/ [L, mirror], a retractor used to separate the walls of a cavity to make examination possible, such as an ear speculum, an eye speculum, a nasal speculum, or a vaginal speculum.

Nasal specula *(Seidel et al, 2011)*

speech [ME, *speche*], **1.** the utterance of articulate vocal sounds that form words of a language to give expression to one's thoughts or ideas. **2.** communication by means of spoken words. **3.** the faculty of language production, which involves the complex coordination of the muscles and nerves of the organs of articulation. Any neurological or muscular injury or defect involving these organs results in various speech impediments or dysfunctions. Kinds of dysfunctions include **ataxic speech, explosive speech, scanning speech, slurred speech,** and **staccato speech.**

speech abnormalities, abnormal or difficult function of speech.

speech audiometry. See **audiometry.**

speech centers [AS, *spaec* + Gk, *kentron*], either of two motor areas involved in speech. Broca's motor speech area is a unilateral area in the posterior part of the inferior frontal gyrus and is usually on the dominant hemisphere. Wernicke's second motor speech area is an area comprising the posterior part of the superior temporal gyrus next to the transverse temporal gyri and the supramarginal and temporal gyri, also on the dominant hemisphere. See also **Broca's area, Wernicke's center.**

speech dysfunction, any defect or abnormality of speech, including aphasia, alexia, stammering, stuttering, aphonia, and slurring. Speech problems may result from any of a variety of causes, among them neurological injury to the cerebral cortex; muscular paralysis caused by trauma, disease, or cerebrovascular accident; structural abnormality of the organs of speech; emotional or psychological tension, strain, or depression; hysteria; and severe mental retardation. See also **speech.**

speech-language pathologist (SLP), a health professional with graduate education in human communication, its development, and its disorders. An SLP specializes in the measurement and evaluation of language abilities, auditory processes, speech production, and swallowing problems; clinical treatment of speech and language disorders; and research methods in the study of communication problems. Also called **speech-language therapist.**

speech-language pathology, 1. the study of abnormalities of speech and language. **2.** the diagnosis and treatment of abnormalities of speech and language as practiced by a speech pathologist.

speech-language therapist. See **speech-language pathologist.**

speech reading [ME, *reden,* to explain], a method of oral communication in which one uses the visual clues of the speaker's lip and facial movements, along with residual hearing. Gestures and "body language" also are observed. Formerly called **lip reading.** See also **sign language.**

speech reception threshold, the minimum intensity in decibels at which a patient can understand 50% of spoken words; used in tests of speech audiometry. Also called *speech recognition threshold*.

speech synthesizer [AS, *spaec* + Gk, *synthesis,* placing together], an electronic apparatus with a keyboard that produces sounds that imitate the human voice.

speech therapy [AS, *spaec* + Gk, *therapeia,* treatment], the application of treatments and counseling in the prevention or rehabilitation/remediation of speech and language disorders. See also **speech-language pathologist.**

speed [AS, *spedan,* to hasten], **1.** the rate of change of position with time. Compare **velocity. 2.** See **amphetamines. 3.** a reciprocal of the amount of radiation used to produce an image with various components of an x-ray imaging system, such as screens, film, and image intensifiers. There is often a tradeoff between radiation dose to the patient and the overall image quality. Thus a system using little radiation is "fast," whereas one requiring more radiation is "slow." **4.** the amount of exposure of film to light or x-rays needed to produce a desired image. X-ray film speed usually is indicated as the reciprocal of the exposure in roentgens necessary to produce a density of 1 above the base and fog levels. See also **fogged film fault.**

speed shock, a sudden adverse physiological reaction to IV medications or drugs that are administered too quickly. Some signs of speed shock are a flushed face, headache, a tight feeling in the chest, irregular pulse, loss of consciousness, and cardiac arrest.

sPEEP, abbreviation for **spontaneous PEEP.**

spell of illness [ME, *spel* + *illr,* bad], a period regarded by Medicare rules as the number of days between the admission of an insured patient to a hospital and the day that marks the end of a period during which the insured has not been an inpatient in a hospital or a skilled nursing facility.

sperm. See **semen, spermatozoon.**

-sperm /spurm/, suffix meaning a "seed": *gymnosperm, oosperm, zygosperm*.

sperm agglutination test, (for male factor infertility) any of various tests for presence of antisperm antibodies as a cause of infertility, based on the ability of large multivalent isotypes, such as IgM or secretory IgA, to cross-link and agglutinate spermatozoa that have such antibodies. Serum or seminal plasma is mixed with a known concentration of sperm; immunoglobulins in the mixture then begin agglutinating the sperm. After a given period of time at 37° C, the amount of agglutination is assessed.

sperm antibody, a glycoprotein that specifically recognizes the head or tail of a spermatozoon. The antibodies are found often in vasectomized males and infrequently in infertile males.

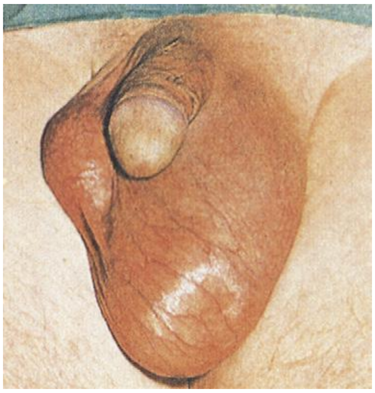
spermatic cord /spərmat′ik/ [Gk, *sperma,* seed, *chorde*, string], a structure extending from the deep inguinal ring in the abdomen to the testis, descending nearly vertically into the scrotum. The left spermatic cord is usually longer than the right. Consequently, the left testis usually hangs lower than the right. Each cord comprises arteries, veins, lymphatics, nerves, and the vas deferens of the testis.

spermatic duct. See **vas deferens.**

spermatic fistula, an abnormal passage communicating with a testis or a seminal duct.

spermatid /spur′mətid, spərmat′id/ [Gk, *sperma*, seed], a male germ cell that arises from a spermatocyte and becomes a mature spermatozoon in the last phase of spermatogenesis.

spermatocele /spərmat′əsēl′, spur′-/ [Gk, *sperma* + *kele*, tumor], a cystic swelling, either of the epididymis or of the rete testis, that contains spermatozoa. It lies above, behind, and separate from the testis. It is usually painless and requires no therapy.

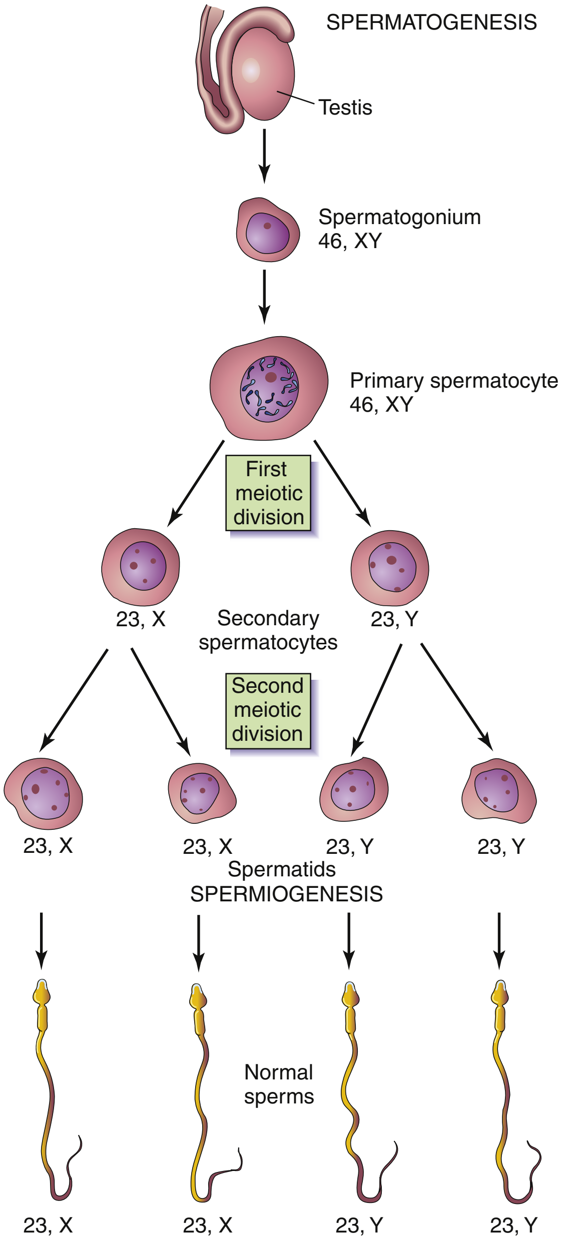


Spermatocele *(Lloyd-Davies et al, 1994)*

spermatocide /spərmat′əsīd, spur′-/ [Gk, *sperma* + L, *caedere*, to kill], a chemical substance that kills spermatozoa by reducing their surface tension, causing the cell wall to break down by a bactericidal effect or by creation of a highly acidic environment. Among many spermatocidal agents used in various contraceptive creams are lactic acid, phenylmercuric acetate, chloramine polyethylene glycol, benzethonium chloride, and certain quinine compounds. Also called **spermicide.**

spermatocyte /spur′mətōsīt′/ [Gk, *sperma* + *kytos*, cell], a male germ cell that arises from a spermatogonium. Each spermatocyte gives rise to two haploid secondary spermatocytes that become spermatids.

spermatogenesis /spərmat′əjen′əsis, spur′-/ [Gk, *sperma* + *genesis*, origin], the process of development of spermatozoa, consisting of two stages. In the first stage, spermatogonia



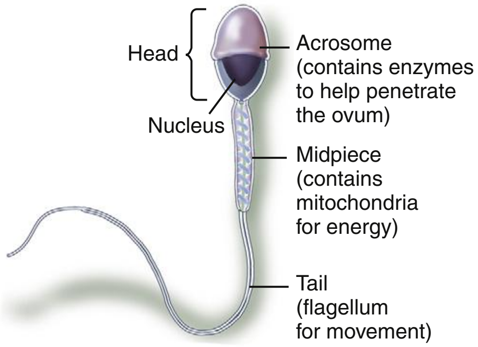
Spermatogenesis *(Moore and Persaud, 2008)* become spermatocytes, which develop into spermatids. In the second stage, called spermiogenesis, the spermatids become spermatozoa. Also called **spermatocytogenesis, spermiogenesis. —***spermatogenic, spermatogenous, adj.*

spermatogonium /-gō′nē·əm/ *pl.* spermatogonia [Gk, *sperma* + *gone,* generation], a male germ cell that gives rise to a spermatocyte early in spermatogenesis.

spermatopathia /-path′ē·ə/ [Gk, *sperma,* seed, *pathos,* disease], pertaining to diseased sperm or their associated organs. Also called **spermopathy.**

spermato-, spermo-, prefix meaning “seed, specifically the male generative element”: *spermatoblast, spermatocyst, spermatogenesis.*

spermatozoon /spur′mətəzō′ən, spərmat′-/*pl.* **spermatozoa** [Gk, *sperma* + *zoon,* animal], a mature male germ cell that develops in the seminiferous tubules of the testes. Resembling a tadpole, it is about 50 μm (1/500 inch) long and has a head with a nucleus, a neck, and a tail that provides propulsion. Developed in vast numbers after puberty, spermatozoa are the generative component of the semen. See also **spermatogenesis.**



Head
Nucleus
Acrosome (contains enzymes to help penetrate the ovum)
Midpiece (contains mitochondria for energy)
Tail (flagellum for movement)

Spermatozoon *(Leonard, 2009)*

sphenoid bone, the bone at the base of the skull, anterior to the temporal bones and the basilar part of the occipital bone. It resembles a bat with its wings extended. Also called **sphenoid.**

sperm bank [Gk, *sperma,* seed; It, *banca,* bench], a facility for storage of semen to be used for artificial insemination.

sperm head, the oval anterior end of a spermatozoon, which contains the male pronucleus and is surrounded by the acrosome.

-spermia, -spermy, suffix meaning “(condition of) possessing or producing seed”: *aspermia, asthenospermia, necrospermia.*

spermicidal /spur′misī′dəl/, destructive to spermatozoa.

spermicide. See **spermatocide.**

sperm immobilization test, (for male factor infertility) a test for antisperm antibodies as a cause of infertility, based on the loss of ability of spermatozoa with such surface antibodies to move when complement is present (as it normally is in the female reproductive tract). Serum from the patient is incubated with motile sperm and complement is added. After 1 hour the mixture is checked to calculate the percentage of formerly motile sperm that can no longer move; a 50% reduction in motility is a positive result for presence of antisperm antibodies. Also called *Isojima test.*

spermiogenesis. See **spermatogenesis.**

spermo-. See **spermato-.**

spermopathy. See **spermatopathia.**

sperm penetration assay (SPA), a test for the ability of spermatozoa to penetrate oocytes in vitro. Hamster oocytes that lack the zona pellucida are exposed to the spermatozoa in question. Such zona-free oocytes can undergo heterologous membrane fusion with the membranes of spermatozoa that have undergone the acrosome reaction. An assessment is then made of the proportion of oocytes that have been successfully penetrated.

sperm swim up, the migration of spermatozoa into culture medium.

sperm swim-up technique, any of several methods of checking sperm for motility. A semen sample is centrifuged to form pellets, which are then covered with culture medium. The spermatozoa with greatest motility will swim up into the culture medium and be more suitable for use in in vitro fertilization.

sperm washing, the bathing of fresh sperm with a special solution to remove antibodies and other contaminants so that it can be used for in vitro fertilization or some other technique of artificial insemination.

-spermy. See **-spermia.**

SPF, abbreviation for **sunscreen protective factor index.**

sp. gr., abbreviation for **specific gravity.**

sphacel-, prefix meaning “gangrene”: *sphaceloderma, sphacelotoxin, sphacelus.*

sphacelous /sfas′ələs/, pertaining to something that is necrotic or gangrenous.

-sphaera, -sphaere. See **-sphere.**

sphaero-. See **sphero-.**

S-phase, the phase of the cell cycle in which DNA is synthesized before mitosis.

spheno-, prefix meaning “sphenoid bone or a wedge”: *sphenocephaly, sphenoidotomy, sphenotemporal.*

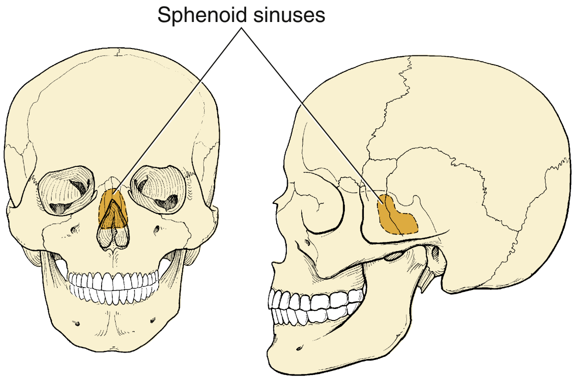
sphenoethmoidal suture. See **ethmosphenoid suture.**

sphenoethmoid recess /sfē′nō·eth′moid/ [Gk, *sphen,* wedge, *eidos,* form; L, *recedere,* to retreat], a narrow opening in the lateral wall of the nasal cavity bounded above by the cribriform plate of the ethmoid and the body of the sphenoid and below by the superior nasal concha. It opens into the sphenoidal sinus of the skull.

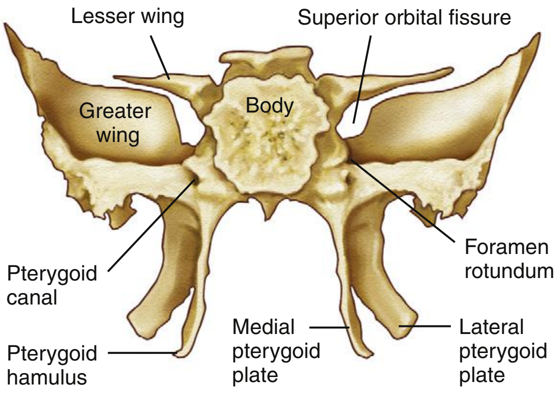
sphenoid /sfē′noid/ [Gk, *sphen,* wedge, *eidos,* form], wedge-shaped. See also **sphenoid bone.**

sphenoidal fissure /sfēnoi′dəl/ [Gk *sphen,* wedge, *eidos* form], a cleft between the great and small wings of the sphenoid bone.

sphenoidal sinus, one of a pair of cavities in the sphenoid bone of the skull, lined with mucous membrane that is continuous with that of the nasal cavity. Compare **ethmoidal air cell, frontal sinus, maxillary sinus.**



Sphenoidal sinus
(Bontrager and Lampignano, 2010)



Sphenoid bone

sphenoid fontanel, an anterolateral fontanel that is usually not palpable. See also **fontanel.**

sphenoiditis /sfē′noidī′tis/ [Gk, *sphen,* wedge, *eidos,* form, *itis,* inflammation], an inflammation of the sphenoidal sinus.

sphenomandibular ligament /sfē′nōmandib′yələr/ [Gk, *sphen* + *eidos* + L, *mandere,* to chew], one of a pair of flat, thin ligaments comprising part of the temporomandibular joint between the mandible of the jaw and the temporal bone of the skull. It is attached to the spine of the sphenoid bone and becomes broader as it descends to the lingula of the mandibular foramen.

sphenopalatine artery, the largest vessel supplying the nasal cavity; the terminal branch of the maxillary artery in the pterygopalatine fossa.

sphenoparietal suture, the articulation of the sphenoid bone with the parietal bone in the calvaria.

sphenosquamous suture, the articulation of the sphenoid bone with the anterior edge of the temporal bone.

sphere /sfir/, a globe-shaped object, theoretically generated by a circle revolving on a diameter as its axis.

-sphere, -sphaera, -sphaere, **1.** suffix meaning a "spheric body": *chondriosphere, oncosphere, somosphere.* **2.** suffix meaning a "realm that supports life": *biosphere, vivosphere, zoosphere.*

sphero-, sphaero-, prefix meaning "round or a sphere": *spherocyte, spherolith, spherometer.*

spherocyte /sfir′əsīt/ [Gk, *sphaira,* sphere, *kytos,* cell], an abnormal spherical red blood cell with a high cytoplasm-to-membrane ration. In Wright-stained peripheral blood films, spherocytes are dense, lack central pallor, and have a reduced diameter. Spherocytes appear most frequently in warm autoimmune hemolytic anemia and hereditary spherocytosis. —*spherocytic, adj.*

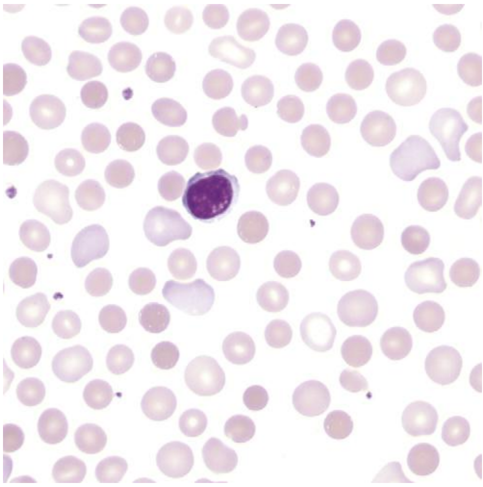
spherocytic anemia /sfir′əsit′ik/, autosomal-dominant hemolytic anemia characterized by hemolytic anemia caused by the presence of spherical red blood cells. The cells are fragile and tend to hemolyze in the oxygen-poor peripheral circulatory system. Episodic crises of abdominal pain, fever, jaundice, and splenomegaly occur. Because repeated transfusions are often needed to treat the anemia, hemochromatosis may develop. Splenectomy may then be necessary. Compare **congenital nonspherocytic hemolytic anemia.** See also **elliptocytosis.**

spherocytosis /sfir′ōsītō′sis/, the abnormal presence of spherocytes in the blood. Compare **elliptocytosis.**

spheroidal /sfir′oidəl/ [Gk, *sphaira,* ball, *eidos,* form], ball-shaped.

spheroidea. See **ball-and-socket joint.**

spherule /sfer′yo͞ol/ [Gk, *sphaira,* ball], a small ball.



Spherocytosis
(Carr and Rodak, 2008)

sphincter /sfingk′tər/ [Gk, *sphingein,* to bind], a circular band of muscle fibers that constricts a passage or closes a natural opening in the body, such as the hepatic sphincter in the muscular coat of the hepatic veins near their union with the superior vena cava, and the external anal sphincter, which closes the anus.

sphincter-, prefix meaning "band or sphincter": *sphincteral, sphincterectomy, sphincteric.*

sphincter ani, a double set of circular muscles at the opening of the anus. One, the sphincter ani internus, consists of a thickened inner circular coat of the bowel smooth muscle; the other, the sphincter ani externus, is a flat sheet of striated voluntary muscle surrounding the anal orifice.

sphincter choledochus /kōled′əkəs/, a smooth muscle sphincter that encircles the lower end of the bile duct and is part of the sphincter of Oddi.

sphincter muscle of pancreatic duct, a sphincter that surrounds the pancreatic duct just above the hepatopancreatic ampulla.

sphincter of Oddi [Ruggero Oddi, Italian physician, 1864–1913], a sheath of muscle fibers surrounding the lower end of the common bile and pancreatic ducts as they cross the wall of the duodenum.

sphincter of Oddi dysfunction, abdominal pain or jaundice with failure of the sphincter of Oddi to function properly. It may occur several years after cholecystectomy or as a result of unknown causes. See also **biliary dyskinesia.**

sphincter pupillae, a muscle that contracts the iris, narrowing the diameter of the pupil of the eye. It is composed of circular fibers arranged in a narrow band, about 1 mm wide, surrounding the margin of the pupil toward the posterior surface of the iris. The circular fibers near the free margin of the iris are closely packed; those that are near the periphery of the band are more separated and form incomplete circles. The fibers of the sphincter pupillae blend with the fibers of the dilatator pupillae near the margin of the pupil and are innervated by a motor root of the ciliary ganglion from the oculomotor nerve. Compare **dilator pupillae.**

sphincter spasm, spasm of a sphincter muscle, particularly an anal sphincter.

sphingolipid /sfing′gōlip′id/ [Gk, *sphingein,* to bind, *lipos,* fat], a compound that consists of a lipid and a sphingosine. It is found in high concentrations in the brain and other tissues of the nervous system, especially membranes.

sphingomyelin /sfing′gōmī′əlin/ [Gk, *sphingein* + *myelos,* marrow], any of a group of sphingolipids containing phosphorus. It occurs primarily in the tissue of the nervous system, generally in membranes, and in the lipids in the blood.

sphingomyelin lipidosis, any of a group of diseases characterized by an abnormality in the ability of the body to store sphingolipids. Kinds of sphingomyelin lipidosis include **Gaucher's disease, Niemann-Pick disease,** and **Tay-Sachs disease.** See also **angiokeratoma corporis diffusum.**

sphingosine /sfing′gōsēn/, a long-chain, unsaturated amino alcohol, a major constituent of sphingolipids, including sphingomyelins.

sphygm-, sphygmo-, prefix meaning "pulse": *sphygmodynamometer, sphygmoid, sphygmomanometer.*

-sphygmia, suffix meaning "(condition of the) pulse": *anisosphygmia, hemisphygmia, sychnosphygmia.*

sphygmic interval. See **ejection period.**

sphygmo-. See **sphygm-.**

sphygmogram /sfig′məgram/ [Gk, *sphygmos,* pulse, *gramma,* record], a pulse tracing produced by a sphygmograph. A curve occurs on the tracing with each atrial pulsation. An upward, primary elevation is followed by a sudden drop to a point slightly above the baseline. The curve then gradually descends to the baseline in small decrements of amplitude. Sphygmographic abnormalities of rate, rhythm, and form may be diagnostically useful in an assessment of cardiovascular function.

sphygmograph /sfig′məgraf/, an instrument that records the force of the arterial pulse on a tracing, the sphygmogram. **—***sphygmographic, adj.*

sphygmoid /sfig′moid/ [Gk, *sphygmos,* pulse, *eidos,* form], pertaining to or resembling the pulse.

sphygmomanometer /sfig′mōmənom′ətər/ [Gk, *sphygmos* + *manos,* thin, *metron,* measure], an instrument for indirect measurement of blood pressure. It consists of an inflatable cuff that fits around a limb, a bulb for controlling air pressure within the cuff, and a mercury or aneroid manometer. Pressure in the compressed artery is estimated by the column of mercury it balances when the cuff is inflated. See also **blood pressure, manometer.**

sphygmoplethysmograph /-pləthis′məgraf′/ [Gk, *sphygmos,* pulse, *plethysmos,* increase, *graphein,* to record], an instrument for measuring and recording the arterial pulse curve and blood flow in a limb.

spica [L, *spica,* spike, or ear of wheat], a figure-eight bandage that, when applied to a joint, resembles the head of a stalk of wheat.

spica bandage /spī′kə/ [L, *spica,* spike of wheat; Fr, *bande,* strip], a figure-eight bandage in which each turn generally overlaps the previous to form a succession of V-like designs. It may be used to give support, to apply pressure, or to hold a dressing in place on the chest, limbs, thighs, or pelvis.

spica cast, an orthopedic cast applied to immobilize part or all of the trunk of the body and part or all of one or more extremities. It is used to treat various fractures, such as of the hip and the femur, and to correct or maintain the correction of hip deformities. Kinds of spica casts are **bilateral long-leg spica cast, one-and-a-half spica cast, shoulder spica cast,** and **unilateral long-leg spica cast.** See also **cast.**

spicule /spik′yo͞ol/ [L, *spiculum,* point], a small sharp body with a needlelike point.

spider angioma [ME, *spithre* + Gk, *angeion,* vessel, *oma,* tumor], a form of telangiectasis characterized by a central elevated red dot the size of a pinhead from which small blood vessels radiate. Spider angiomas are often associated with elevated estrogen levels, such as occur in pregnancy or when the liver is diseased and unable to detoxify estrogens. Also called **spider nevus.** See also **telangiectasia.**

spider antivenin. See **black widow spider antivenin.**

spider bite [ME, *spithre* + AS, *bitan* + L, *potio,* drink], a puncture wound produced by the bite by any of nearly 60 species of venomous spiders found in North America. Most spiders have fangs that are too short or fragile to penetrate the skin, but some are dangerous to humans. These include the black widow, *Latrodectus mactans;* the brown recluse, *Loxosceles reclusa;* and species of jumping spiders and tarantulas. Spider venom may contain enzymatic proteins, including peptides that may affect neuromuscular transmission or cardiovascular function.

spider mite, either *Tetranychus molestissimus* or *T. telarius.*

spider nevus. See **spider angioma.**

spider telangiectasia [ME, *spithre* + Gk, *telos,* end, *angeion,* vessel, *ektasis,* dilation], a branched group of dilated capillary blood vessels forming a spiderlike image on the skin. Also called **nevus araneus.**

spike, a sharp peak in an electronic recording, such as an oscillograph.

spikeboard /spīk′bôrd/, a device that enables people with upper extremity disabilities to stabilize foods for meal preparation, typically used by individuals with functional use of only one hand. Also called **paring board.**

spillway [AS, *spillan,* to destroy, *weg,* wagon track], a channel or passageway through which food normally escapes from the occlusal surfaces of the teeth during chewing.

spin [AS, *spinnan,* to draw threads], **1.** the intrinsic angular momentum of an elementary particle or a nucleus of an atom. **2.** intrinsic joint movements about an axis perpendicular to the articular surface.

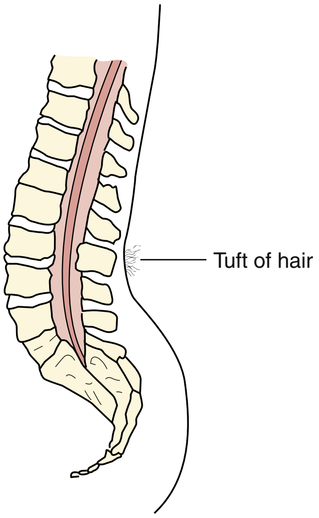
spina /spī′nə/ *pl.* **spinae** [L, backbone], **1.** the spinal column. **2.** a spine or a thornlike projection, such as the bony projection on the anterior border of the ilium, forming the anterior end of the iliac crest.

spina bifida /bif′ədə, bī′fədə/, a congenital neural tube defect in which there is a developmental anomaly in the posterior vertebral arch. Spina bifida is relatively common, occurring approximately 10 to 20 times per 1000 births. It may occur with only a small deformed lamina separated by a midline gap, or it may be associated with the complete absence of laminae surrounding a large area. In cases where the separation is wide enough, contents of the spinal canal protrude posteriorly, and a myelomeningocele is evident. Neurological deficits do not usually accompany the anomalies involving only bony deformity. Direct signs and symptoms are rarely noted in spina bifida, which is frequently diagnosed accidentally during radiographic examinations required for other reasons. Spina bifida that does not involve herniation of the meninges or the contents of the spinal canal **(spina bifida occulta)** rarely requires treatment. Also called **spinal dysrhaphism.**

spina bifida anterior, incomplete closure along the anterior surface of the vertebral column. The defect is often associated with developmental anomalies of the abdominal and thoracic viscera.

spina bifida cystica, a developmental defect of the central nervous system in which a hernial cyst containing meninges (meningocele), spinal cord (myelocele), or both (myelomeningocele) protrudes through a congenital cleft in the vertebral column. The protruding sac is encased in a layer of skin or a fine membrane that readily ruptures, causing the leakage of cerebrospinal fluid and an increased risk of meningeal infection. The severity of neurological dysfunction and associated defects depends directly on the degree of nerve involvement. The most severe type is lumbosacral myelomeningocele, which is frequently associated with hydrocephalus and the Arnold-Chiari malformation. Compare **spina bifida occulta.** See also **myelomeningocele, neural tube defect.**

spina bifida occulta, defective closure of the laminae of the vertebral column in the lumbosacral region without hernial protrusion of the spinal cord or meninges. The defect, which is quite common, occurs in about 5% of the population. It is identified externally by a skin depression or dimple, dark tufts of hair, telangiectasis, or soft subcutaneous lipomas at the site. Because the neural tube has closed, there are usually no neurological impairments associated with the defect. However, any abnormal adhesion of the spinal cord to the area of the malformation may lead to neuromuscular disturbances, usually problems with gait and foot weakness and with the bowel and bladder sphincters. Compare **spina bifida cystica.**



Tuft of hair

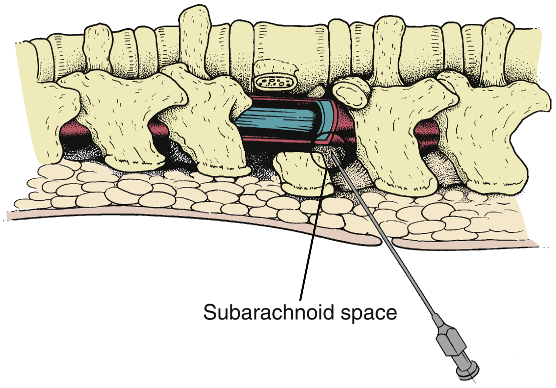
Spina bifida occulta
(Sorrentino, 2012)

spinae. See **spina.**

spinal /spī′nəl/ [L, *spina*], **1.** *adj,* pertaining to a spine, especially the spinal column. **2.** *n, (informal)* spinal anesthesia, such as saddle block or caudal anesthesia.

spinal accessory nerve. See **accessory nerve.**

spinal anesthesia [L, *spina,* backbone; Gk, *anaisthesia,* lack of feeling], a state of lack of sensation in the lower part of the body produced by injection of a local anesthetic drug into the subarachnoid cerebrospinal fluid space. May be combined with narcotics such as preservative-free morphine, and/or Fentanyl for postoperative analgesia. Also called **subarachnoid block anesthesia.** See also **anesthesia, regional anesthesia.**



Subarachnoid space

Spinal anesthesia
(Ignatavicius and Workman, 2010)

spinal aperture, a large opening formed by the body of a vertebra and its arch.

spinal block [L, *spina,* backbone; OFr, *bloc*], an obstruction of cerebrospinal fluid circulation. See also **subarachnoid block anesthesia.**

spinal canal, the cavity within the vertebral column.

spinal caries. See **tuberculous spondylitis.**

spinal column. See **vertebral column.**

spinal cord, a long, nearly cylindric structure lodged in the vertebral canal and extending from the foramen magnum at the base of the skull to the upper part of the lumbar region. A major component of the central nervous system, the adult cord is approximately 1 cm in diameter, with an average length of 42 to 45 cm and a weight of 30 g. The cord is an extension of the medulla oblongata of the brain that extends

Anterior column
Gray commissure

Cross section of the spinal cord *(Patton and Thibodeau, 2010)* at the level of the first or second lumbar vertebra. The cord conducts sensory and motor impulses to and from the brain and controls many reflexes. Thirty-one pairs of spinal nerves originate from the cord: 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal. It has an inner core of gray material consisting mainly of nerve cell bodies. The cord is enclosed by three protective membranes (meninges): the dura mater, arachnoid, and pia mater. Also called **chorda spinalis, medulla spinalis.** See also **segments of spinal cord, spinal nerves.**

spinal cord compression, an abnormal and often serious condition resulting from pressure on the spinal cord. The symptoms range from temporary numbness of an extremity to permanent tetraplegia, depending on the cause, severity, and location of the pressure. Causes include spinal fracture, vertebral dislocation, tumor, hemorrhage, and edema associated with contusion. See also **herniated disk, spondylolisthesis.**

spinal cord injury, any one of the traumatic disruptions of the spinal cord, often associated with extensive musculoskeletal involvement. Common spinal cord injuries are vertebral fractures and dislocations, such as those commonly suffered by individuals involved in car accidents, airplane crashes, or other violent impacts. Such trauma may cause varying degrees of paraplegia and tetraplegia. Injuries to spinal structures below the first thoracic vertebra may produce paraplegia. Injuries to the spine above the first thoracic vertebra may cause tetraplegia. Injuries that completely transect the spinal cord cause permanent loss of motor and sensory functions activated by neurons below the level of the lesions involved. Spinal cord injuries produce a state of spinal shock, characterized by flaccid paralysis, and complete loss of skin sensation at the time of injury. Within a few weeks the muscles affected may become spastic, and skin sensation may return to a slight degree. The motor and sensory losses that prevail a few weeks after the injury are usually permanent. Musculoskeletal complications are associated with the neurological involvement of spinal cord injuries, and prevention of decubitus ulcers and the treatment of any loss of bladder and bowel control are continuing concerns. Treatment of spinal cord injuries varies considerably and involves numerous approaches, such as orthopedic exercises, ambulatory techniques, and special physical and psychological therapy. See also **hemiplegia, paraplegia, tetraplegia.**

spinal cord tumor, a neoplasm of the spinal cord of which more than 50% are extramedullary, about 25% are intramedullary, and the rest are extradural. Symptoms depend on the location and rate of growth of the tumor. They usually develop slowly and may progress from unilateral paresthesia and a dull ache to lancinating pain; weakness in one or both legs; abnormal deep tendon reflexes; and, in advanced cases, monoplegia, hemiplegia, or paraplegia. Function of the autonomic nervous system is sometimes disturbed, causing areas of dry, cold, bluish pink skin or profuse sweating of the lower extremities. The diagnosis is made by radiographic and myelographic examination. About 30% of spinal cord tumors are circumscribed, encapsulated meningiomas, and 25% are schwannomas; these two kinds are found chiefly in the thoracic region. Some 20% are gliomas, and the others consist of congenital lipomas, epidermoids, and metastatic lesions. The dura is resistant to invasion, but many extradural tumors are metastatic lesions from primary cancers in the prostate, lung, breast, thyroid, and GI tract. Most extramedullary and nonmetastatic extradural tumors are surgically removed; intermedullary lesions are enucleated, whenever possible; inoperable tumors are treated with radiotherapy and chemotherapy. Tumors of the spinal cord may arise at any age but appear most frequently in the third decade of life and are one fourth as common as brain neoplasms. Nursing care of the patient with a spinal cord tumor involves careful assessment and reporting of motor and sensory status.

spinal curvature, any persistent, abnormal deviation of the vertebral column from its normal position. Kinds of spinal curvature are **kyphoscoliosis, kyphosis, lordosis,** and **scoliosis.**

spinal dysrhaphism. See **spina bifida.**

spinal fasciculi. See **spinal tract.**

spinal fluid. See **cerebrospinal fluid.**

spinal fusion, the fixation of an unstable segment of the spine, accomplished sometimes by skeletal traction or immobilization of the patient in a body cast but most frequently by a surgical procedure. Operative ankylosis may be performed in the treatment of spinal fractures or after diskectomy or laminectomy for the correction of a herniated vertebral disk. Surgical fusion involves the stabilization of a spinal section with a bone graft or synthetic device introduced through a posterior incision in the lumbar region; in the less frequently fused cervical region the incision may be anterior or posterior. Also called **spondylosyndesis.**

spinal headache, a severe headache occurring after spinal anesthesia, lumbar puncture, or epidural anesthesia, caused by a leak of cerebrospinal fluid from the subarachnoid space. Severe spinal headache may be accompanied by diminished aural and visual acuity. Treatment usually includes keeping the patient flat in bed to relieve the meningeal irritation, promoting increased fluid intake to increase the intravascular volume and increase the production and volume of cerebrospinal fluid, and administering analgesics to reduce pain. If severe headache persists, an autologous blood patch procedure may be performed. Also called **postdural puncture headache.** See also **epidural blood patch.**

spinal manipulation, the forced passive flexion, extension, and rotation of vertebral segments, carrying the elements of articulation beyond the usual range of movement to the limit of anatomical range. Spinal manipulation may be used effectively in physiotherapy for the treatment of vertebral and sacroiliac dislocations, sprains, and adhesions.

spinal meningitis, an inflammation of the membranes of the spinal cord.

spinal motion segment, two adjacent vertebrae and the connecting tissues that bind them together.

spinal muscular atrophy. See **Duchenne's disease.**

spinal nerves, the 31 pairs of nerves without special names that are connected to the spinal cord and numbered according to the level of the vertebral column at which they emerge. There are 8 cervical, 12 thoracic, 5 lumbar, 5 sacral, and 1 coccygeal pair. The first cervical pair of nerves emerges from the spinal cord in the space between the first cervical vertebra and the occipital bone. The rest of the cervical pairs and all the thoracic pairs emerge horizontally through the intervertebral foramina of their respective vertebrae, such as the second cervical pair, which emerges through the foramina above the second cervical vertebra. The lumbar, sacral, and coccygeal nerve pairs descend from their points of origin at the lower end of the cord before reaching the intervertebral foramina of their respective vertebrae. Each spinal nerve attaches to the spinal cord by an anterior (or ventral) root and a posterior (or dorsal) root. The nerve impulses enter the cord by way of posterior roots. The posterior roots supply skin and muscles of much of the body with some of the nerve fibers supplying autonomic functions. The posterior roots contain sensory neurons and accompany a distended spinal ganglion within the vertebral foramina. The ventral roots contain motor neuron axons. The sacral plexus in the pelvic cavity comprises certain spinal nerve fibers from the lumbar

Spinal nerves and spinal column
(Drake, Vogl, and Mitchell, 2010)

and sacral regions and gives rise to the great sciatic nerve in the back of the thigh. See also **spinal cord.**

spinal puncture. See **lumbar puncture.**

spinal reflex [L, *spina* + *reflectere,* to bend back], any reflex with a pathway through the spinal cord but not the brain.

spinal segment, a division of the spinal cord containing a bilateral pair of nerve roots. From the anterior to the posterior, the segments are referred to as cervical (C_1-C_8), thoracic (T_1-T_{12}), lumbar (L_1-L_5), sacral (S_1-S_5), and coccygeal (Co_1-Co_3).

spinal shock, a form of shock associated with acute injury to the spinal cord. Temporary suppression of reflexes controlled by segments below the level of injury. The period of shock may last from hours to months. See also **shock.**

spinal stenosis, narrowing of the vertebral canal, nerve root canals, or intervertebral foramina of the lumbar spine, caused by encroachment of bone on the space. Symptoms are caused by compression of the cauda equina and include pain, paresthesias, and neurogenic claudication. The condition either may be congenital or may be caused by spinal degeneration. See also **spinal cord compression.**

spinal tract, any one of the ascending (sensory) and descending (motor) pathways for sensory or motor nerve impulses that is found in the white matter of the spinal cord. Twenty-one different tracts lie within the dorsal, ventral, and lateral funiculi of the white substance. Ascending tracts conduct impulses up the spinal cord to the brain; descending tracts conduct impulses down the cord from the brain. The four major ascending tracts are the lateral spinothalamic, the ventral spinothalamic, the fasciculi gracilis and cuneatus, and the spinocerebellar. The four major descending tracts are the lateral corticospinal, the ventral corticospinal, the lateral reticulospinal, and the medial reticulospinal. Touch, pressure, proprioception, temperature, and pain are sensory stimuli transmitted via the spinal tracts. Reflex and voluntary motor activity is regulated by motor nerve stimulation from the brain and brainstem to the motor neurons of the spinal cord.

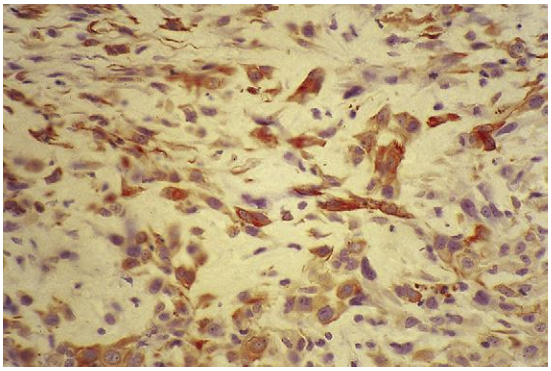
spinal x-ray studies, radiographic studies of the spine to diagnose degenerative arthritic changes, traumatic fractures, tumor metastasis, spondylosis, spondylolisthesis, and spinal alignment abnormalities.

spin density, a measure of the hydrogen concentration in magnetic resonance (MR) imaging. It is proportional to the number of hydrogen nuclei precessing at the Larmor frequency and contributing to the MR signal. See also **Larmor frequency.**

spindle [AS, *spinel,* to spin], **1.** the fusiform-shaped body of achromatin in the cell nucleus during the late prophase and the metaphase of mitosis. It consists of tiny fibers radiating out from the centrosomes and connecting them with one another. **2.** a type of brain wave, consisting of a short series of changes in electric potential with a frequency of 14 per second. **3.** any one of the special receptor organs comprising the neurotendinous and neuromuscular spindles distributed throughout the body. These kinds of spindles serve as special receptor organs that detect the degree of stretch in a muscle or at the junction of a muscle with its tendon and are essential in maintaining muscle tone.

spindle cell, any of various cells that are shaped like spindles, being more or less round in the middle with two ends that are pointed.

spindle cell carcinoma, a rapidly growing neoplasm composed of fusiform squamous cells.



Spindle cell carcinoma *(Fletcher, 2007)*

spindle cell nevus. See **benign juvenile melanoma.**

spine, **1.** See **vertebral column.** **2.** descriptive of a spinous process.

spin-echo (SE), a magnetic resonance pulse sequence in which echoes are generated by rephasing spins in the transverse plane using radiofrequency pulses or magnetic field gradients.

spine of scapula [L, *spina,* backbone, *scapulae,* shoulder blades], a sharp-edged plate of bone projecting posteriorly backward from the flattened scapula base.

spin-lattice relaxation time. See **relaxation time.**

spinnbarkeit /spin′bärkīt, shpin′-/ [Ger, threadability], the clear slippery elastic consistency characteristic of cervical mucus during ovulation. The consistency is that of an uncooked egg white, and it is a valuable sign of the peak fertile period in a woman's menstrual cycle. Observation of spinnbarkeit is useful in natural methods of family planning, in the clinical evaluation of infertility, and in discovering the optimal time for artificial insemination. Spinnbarkeit may be evaluated by the length to which a string of mucus can be drawn between the fingers before breaking. See also **ovulation method of family planning.**

spinning top urethra, deformity of the urethra on urination, with narrowing at the urinary meatus and dilation at the proximal end. Seen sporadically in conditions such as prolonged inflammation of the urethra and detrusor instability. Also called **spinning top deformity.**

spino-, prefix meaning "spine": *spinocain, spinoglenoid, spinotransversarius.*

spinocerebellar /spī′nōser′əbel′ər/ [L, *spina* + *cerebellum,* small brain], pertaining to the spinal cord and the cerebellum.

spinocerebellar disorder, an inherited disorder characterized by a progressive degeneration of the spinal cord and cerebellum, often involving other parts of the nervous system as well. These disorders tend to occur within families and can be inherited as dominant or recessive traits. Onset is usually early, during childhood or adolescence. No effective treatment is known. Some kinds of spinocerebellar degeneration are **ataxia-telangiectasia syndrome, Charcot-Marie-Tooth disease, Dejerine-Sottas disease, Friedreich's ataxia, olivopontocerebellar atrophy,** and **Refsum's syndrome.**

spinofallopian tube shunt. See **ventriculofallopian tube shunt.**

spinous /spī′nəs/ [L, *spina,* backbone], pertaining to an object that has the shape of a spine or thorn.

spinous process [L, *spina,* backbone, *processus*], a spine-like projection of bony tissue, such as the spinous process of a vertebra extending posteriorly from a vertebral arch. Also called **spine.**

spin-spin relaxation time. See **relaxation time.**

spinth-, prefix meaning "spark": *spintharoscope, spintherometer, spintheropia.*

spir-, **1.** prefix meaning "a coil, or coiled": *spiradenitus, spireme, spirillum.* **2.** prefix meaning "breath or breathing": *spiracle, spirogram, spirophore.*

spiral artery. See **screw artery.**

spiral bandage /spī′rəl/ [Gk, *speira,* coil; Fr, *bande,* strip], a roller bandage applied spirally around a limb.

spiral computed tomography. See **helical computed tomography.**

spiral fracture [Gk, *speira,* coil], a bone break that is spiral, oblique, or transverse to the bone's long axis.

spiraling /spī′rəling/, the process by which immunodeficiency allows viral replication, which further depresses the immune system, allowing further viral replication, and so on.

spiral lamina. See **modiolus.**

spiral organ of Corti. See **organ of Corti.**

spiral reverse bandage, a spiral bandage that is turned and folded back on itself as necessary to make it fit the contour of the body more securely.

spirillary rat-bite fever, spirillum fever. See **rat-bite fever.**

spirit /spir′it/ [L, *spiritus,* breath], **1.** any volatile liquid, particularly one that has been distilled. **2.** a volatile substance dissolved in alcohol. See also **volatile.**

spirit of ammonia [L, *spiritus,* breath; *Ammon,* temple in Libya], a solution of 3% ammonium carbonate in alcohol with flavorings added. It is mixed with water for use as a stimulant and carminative.

spiritual growth facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of growth in a patient's capacity to identify, connect with, and call upon the source of meaning, purpose, comfort, strength, and hope in his/her life. See also **Nursing Interventions Classification.**

spiritual healing, the use of spiritual practices, such as prayer, for the purpose of effecting a cure of or an improvement in an illness.

spiritual healing and prayer, the offering of prayers to a higher being or authority for the purpose of reducing stress, promoting healing, or arresting disease. Spiritual healing may be practiced by the individual patient, by groups, or by others with or without the patient's knowledge.

spiritual health, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as connectedness with self, others, higher power, all life, nature, and the universe that transcends and empowers the self. See also **Nursing Outcomes Classification.**

spiritual support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to feel balance and connection with a greater power. See also **Nursing Interventions Classification.**

spiritual therapy [L, *spiritus,* breath; Gk, *therapeia,* treatment], a form of counseling or psychotherapy that involves moral, spiritual, and religious influences on behavior and physical health; the use of spiritual and religious beliefs and values to strengthen the self.

Spiriva, a trademark for **tiotropium.**

Spirochaetales /spi′ro-ke-ta′lēz/, the spirochetes, an order of bacteria in which some species are free-living and some parasitic. It includes the disease-causing genera *Borrelia, Leptospira,* and *Treponema.*

Spirochaeta pallida /spī′rəkē′tə/ [Gk, *speira,* coil, *chaite,* hair; L, *pallidus,* pale], a species of flexible spiral motile microorganisms the causative agent of human syphilis. Also called ***Treponema pallidum.***

spirochete /spī′rəkēt′/ [Gk, *speira,* coil, *chaite,* hair], any bacterium of the genus *Spirochaeta* that is motile and spiral-shaped with flexible filaments. Kinds of spirochetes include the organisms responsible for leptospirosis, relapsing fever, syphilis, and yaws. Also spelled *spirochaete.* Compare ***Bacillus,*** **coccus, vibrio.** —*spirochetal, adj.*

spirochetemia /spī′rōkətē′mē·ə/ [Gk, *speira,* coil, *chaite* + *haima,* blood], the presence of spirochetal organisms in the blood. See also **spirochete.**

spirogram /spī′rōgram/ [Gk, *speira* + *gramma,* record], a visual record of respiratory movements made by a spirometer, used in the assessment of pulmonary function and capacity.

spirograph /spī′rəgraf/ [Gk, *speira* + *graphein,* to record], a device for recording respiratory movements. See also **spirometer.** —*spirographic, adj.*

spirometer /spīrom′ətər/ [Gk, *speira* + *metron,* measure], an instrument that measures and records the volume of inhaled and exhaled air, used to assess pulmonary function. Volumetric information is recorded on a chart, called a spirogram. —*spirometric, adj.*

Handheld office spirometer
(Courtesy ndd Medical Technologies, Inc.)

spirometry /spīrom′ətrē/, laboratory evaluation of the air capacity of the lungs by means of a spirometer. Compare **blood gas determination.** —*spirometric, adj.*

spironolactone /spī′rənəlak′tōn/, a potassium-sparing aldosterone antagonist diuretic.

■ INDICATIONS: It is prescribed in the treatment of primary hyperaldosteronism, edema of congestive heart failure, cirrhosis of the liver accompanied by edema, nephrotic syndrome, essential hypertension, and hypokalemia.

■ CONTRAINDICATIONS: Anuria, acute renal insufficiency, significant impairment of renal function, or hyperkalemia prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are hyperkalemia, gynecomastia, mental confusion, ataxia, impotence, amenorrhea, hirsutism, and urticaria.

spittle [AS, *spittan,* spew], saliva.

Spitz nevus. See **benign juvenile melanoma.**

splanchn-. See **splanchno-.**

splanchnic /splangk′nik/. See **visceral.**

-splanchnic, suffix meaning "viscera, entrails": *somaticosplanchnic, trisplanchnic, vagosplanchnic.*

splanchnic engorgement, the excessive filling or pooling of blood within the visceral vasculature after the removal of pressure from the abdomen, as in the excision of a large tumor, birth of a child, or drainage of a large quantity of urine from the bladder.

splanchnic nerves [Gk, *splanchna,* viscera, *nervus*], a network of nerves, mainly preganglionic fibers, with filaments innervating the penis and clitoris, as well as the uterus, rectum, and other structures of the abdominal cavity.

splanchno-, splanchn-, prefix meaning "a viscus or splanchnic nerve": *splanchnocele, splanchnography, splanchnoptosis.*

splanchnocele /splangk′nōsēl′/ [Gk, *splanchna,* viscera, *kele,* hernia], hernial protrusion of any abdominal viscera. See also **splanchnocoele.**

splanchnocoele /splangk′nōsēl′/ [Gk, *splanchna,* viscera, *koilos,* hollow], a part of the embryonic body cavity, or coelom, that gives rise to the abdominal, pericardial, and pleural cavities. Also called **pleuroperitoneal cavity.**

splanchnopleure /splangk′nōplo͝or′/ [Gk, *splanchna* + *pleura,* side], a layer of tissue in the early developing embryo, formed by the union of endoderm and splanchnic mesoderm. It gives rise to the embryonic gut and the visceral organs and continues externally to the embryo as the yolk sac and allantois. Compare **somatopleure.** —*splanchnopleural, adj.*

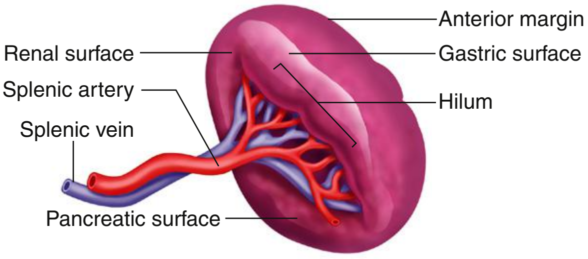
splanchnosomatic reaction. See **viscerosomatic reaction.**

S-plasty /es′plas′te/, a technique of plastic surgery in which an S-shaped instead of a straight line incision is made to reduce tension and improve healing in areas where the skin is loose.

splay /splā/, **1.** to spread or turn out. **2.** to spread out, as said of the limbs. **3.** to open, as with the end of a tubular structure by making a longitudinal incision. **4.** to dislocate, as said of a bone.

splayfoot [ME, *splaien* + AS, *fot*], a foot that is flat and extremely everted, away from the midline. Also called **talipes valgus.**

spleen [Gk, *splen*], a soft, highly vascular, roughly ovoid organ situated between the stomach and the diaphragm in the left hypochondriac region of the body. It is considered part of the lymphatic system because it contains localized lymphatic nodules. It is dark purple and varies in shape in different individuals and within the same individual at different times. The precise function of the spleen has baffled physiologists for more than 100 years, but research indicates it performs various tasks, such as defense, hemopoiesis, blood storage, and destruction and recycling of red blood cells and platelets. The spleen also produces leukocytes, monocytes, lymphocytes, and plasma cells in response to an infectious agent. It produces red cells before birth and is believed to produce red cells after birth only in extreme and hemolytic anemia. If the body suffers severe hemorrhage, the spleen can contract and increase the blood volume from 350 mL to 550 mL in less than 60 seconds. In the adult the spleen is usually about 12 cm long, 7 cm wide, and 3 cm thick. Its weight increases from 17 g or less in the first year to about 170 g at 20 years of age, then slowly decreases to about 122 g at 75 to 80 years of age. The variation in the weight of adult spleens is 100 to 250 g and, in extreme cases, 50 to 400 g. The size of the spleen increases during and after digestion and often increases during illness. Compare **thymus.** —**splenic** /splen′ik/, *adj.*



Spleen *(Patton and Thibodeau, 2010)*

spleen scan, a radiographic scan of the spleen after the injection of radioactive red blood cells, performed to detect a tumor, damage, or other problem.

splen-. See **spleno-.**

Splendore-Hoeppli phenomenon, the deposition of amorphous, eosinophilic, hyaline material around pathogenic organisms, seen in some fungal and parasitic diseases, as the result of a local antigen-antibody reaction.

splenectomy /splənek′təmē/ [Gk, *splen* + *ektomē,* excision], the surgical removal of the spleen. The spleen is a major phagocytic organ of the reticuloendothelial network and also serves as an important site of antibody production.

Infections may follow its removal because the organ plays a vital role in the body's immune system. Splenectomized patients are particularly prone to certain bacterial infections.

-splenia, suffix meaning "condition of the spleen": *asplenia, eusplenia, microsplenia*.

splenic. See **spleen.**

splenic flexure /splen′ik/ [Gk, *splen*, spleen; L, *flectere*, to bend], the left flexure of the colon as it bends at the junction of the transverse and descending segments of the colon, near the spleen.

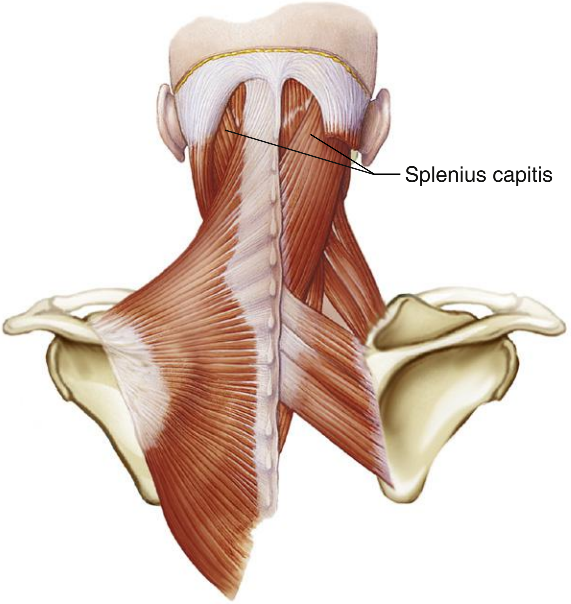
splenic flexure syndrome [Gk, *splen* + L, *flectere*, to bend], a recurrent pain and abdominal distension in the left upper quadrant of the abdomen caused by a pocket of gas trapped in the large intestine below the spleen, at the flexure of the transverse and descending colon. The symptoms are relieved by defecation or passing of flatus.

splenic gland. See **pancreaticolienal node.**

splenic puncture, a perforation of the parenchyma of the spleen to obtain pressure data or to inject radiopaque material.

splenic vein. See **lienal vein.**

splenius capitis /splē′nē·əs/ [Gk, *splenion*, bandage; L, *caput*, head], one of a pair of deep muscles of the neck and back. Arising from the nuchal ligament, the seventh cervical vertebra, and the first three or four thoracic vertebrae, it inserts in the occipital bone and the mastoid process of the temporal bone. It acts to rotate, extend, and bend the head.



Splenius capitis muscle *(Patton and Thibodeau, 2010)*

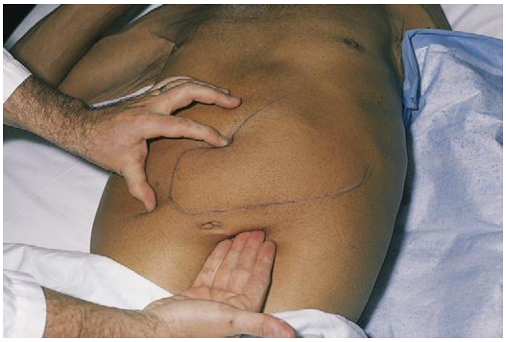
splenius cervicis, one of a pair of deep muscles of the neck and back. Arising from a narrow tendinous band from the spinous processes of the third through the sixth thoracic vertebrae, it inserts into the transverse processes of the upper two or three cervical vertebrae. The muscle is innervated by the lateral branches of the dorsal primary divisions of the middle and the lower cervical nerves. The splenius cervicis acts to rotate, bend, and extend the head and neck. Also called **splenius colli.**

spleno-, splen-, prefix meaning "spleen": *splenocele, splenodiagnosis, splenomalacia*.

splenohepatomegaly /splē′nōhep′ətōmeg′əlē/ [Gk, *splen*, spleen, *hepar*, liver, *megas*, great], an abnormal simultaneous increase in the sizes of the liver and spleen.

splenomedullary leukemia. See **acute myelocytic leukemia, chronic myelocytic leukemia.**

splenomegaly /splē′nōmeg′əlē, splen′-/ [Gk, *splen* + *megas*, large], an abnormal enlargement of the spleen, as is associated with portal hypertension, hemolytic anemia, Niemann-Pick disease, or malaria.

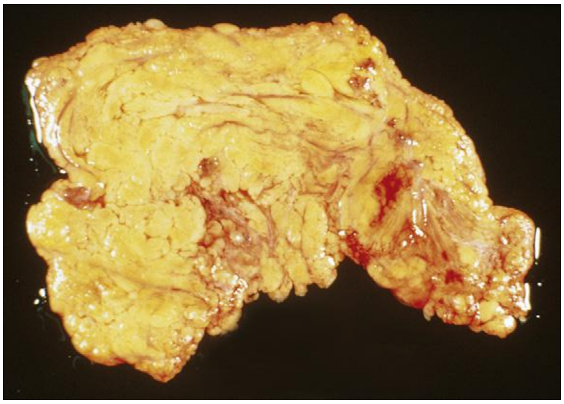


Splenomegaly *(Swartz, 2009)*

splenomyelogenous leukemia. See **acute myelocytic leukemia, chronic myelocytic leukemia.**

splenorenal bypass, a technique of renal revascularization involving creation of a vascular prosthesis from the splenic artery to replace the occluded renal artery.

splenosis /splēnō′sis/, multiple splenic growths in the peritoneum resulting from splenic rupture or iatrogenic injury.



Splenosis of the omentum *(Fletcher, 2007)*

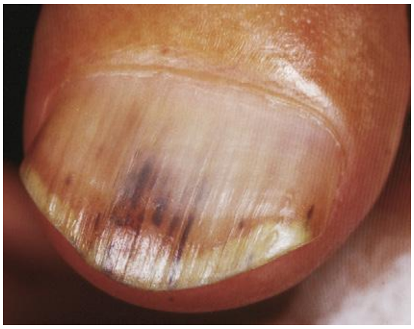
splint [D, *splinte*, piece of wood], **1.** an orthopedic device for immobilization, restraint, or support of any part of the body. It may be rigid (made of metal, plaster, or wood) or flexible (made of felt or leather). **2.** a device, usually made of hard acrylic and wire, for anchoring the teeth or modifying the bite. Compare **brace, cast.**

splinter [D, *splinte*], a sharp, pointed piece of bone or other substance.

splinter fracture [D, *splinte*], a comminuted fracture with thin, sharp bone fragments.

splinter hemorrhage, linear bleeding under a fingernail or toenail, resembling a splinter. It is seen after trauma and in bacterial endocarditis. Also spelled *splinter haemorrhage*.

Finger splint *(Chapleau, 2011)*



Splinter hemorrhage *(Hordinsky, Sawaya, and Scher, 2000)*

splinting¹, the process of immobilizing, restraining, or supporting a body part.

splinting², a nursing intervention from the Nursing Interventions Classification (NIC) defined as stabilization, immobilization, and/or protection of an injured body part with a supportive appliance. See also **Nursing Interventions Classification.**

split-brain state, a condition resulting from the disconnection of the two cerebral hemispheres. It is produced when the corpus callosum is surgically divided completely or partially as a treatment for epilepsy or in congenital absence of corpus callosum. The cognitive effects are identified as a disconnection syndrome.

split caliper stirrup. See **caliper splint.**

split gene [D, *splitten,* to split], a gene whose continuity is interrupted.

split-hand deformity. See **cleft hand.**

split personality. See **dissociative identity disorder.**

split Russell traction, an orthopedic mechanism that combines suspension and traction to immobilize, position, and align the lower extremities in the correction of orthopedic deformities and in the treatment of congenital hip dislocation and hip and knee contractures. Usually applied as adhesive or nonadhesive skin traction, split Russell traction uses a sling to relieve the weight of the lower extremities. The traction weights are suspended from pulley-and-rope systems at the foot and head of the patient's bed. A jacket restraint is often incorporated to help immobilize the patient. Split Russell traction may be applied unilaterally or bilaterally. Compare **Russell's traction.**

split-thickness skin graft, a tissue transplant involving the epidermis and a part of the dermis. This type of graft is the most commonly used method of covering open burn wounds. Also called *split-skin graft*.

split-thickness transplant. See **deep lamellar endothelial keratoplasty.**

splitting, a primitive defense mechanism that when overused represents a developmental arrest. It is a failure to synthesize the positive and negative experiences and ideas one has of oneself, other people, situations, and institutions.

spodo-, prefix meaning "to waste materials": *spodogenous, spodophagous, spodophorous.*

spondyl-, prefix meaning "a physiological condition or change of the vertebrae": *spondylopathy, spondylosis.*

-spondylic /spondil′ik/, suffix meaning "vertebrae": *cyclospondylic, monospondylic, tectospondylic.*

spondylitic [Gk, *sphondylos,* vertebra], pertaining to a person afflicted with spondylitis.

spondylitis /spon′dəlī′tis/ [Gk, *sphondylos,* vertebra, *itis*], an inflammation of any of the vertebrae, usually characterized by stiffness and pain. The condition may be the result of traumatic injury to the spine, infection, or rheumatoid disease. See also **ankylosing spondylitis. —spondylitic,** *adj.*

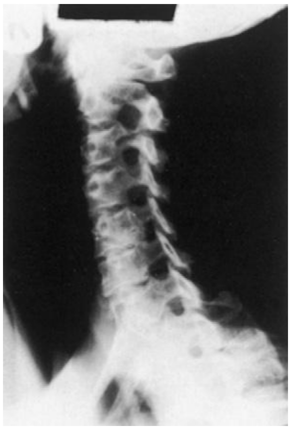
spondylitis ankylopoietica. See **Strümpell-Marie disease.**

spondylo-, prefix meaning "vertebra or the spinal column": *spondylocace, spondylodidymia, spondylolysis.*

spondyloarthropathy /spon′dilō′ärthrop′əthē/, any of a set of diseases of the joints and spine. Most commonly affected are the lower extremities, sacroiliac joint, and hip. Pain and restricted motion of the hips and lower back are typical complaints. Many patients also experience eye disorders.

spondylolisthesis /spon′dilō′listhē′sis/ [Gk, *sphondylos* + *olisthanein,* to slip], the partial forward dislocation of one vertebra over the one below it, most commonly the fifth lumbar vertebra over the first sacral vertebra. Severity of spondylolisthesis is classified by percentage of slip. See also **spinal cord compression.**

spondylosis /spon′dilō′sis/ [Gk, *sphondylos* + *osis*], a condition of the spine characterized by fixation or stiffness of a vertebral joint. See also **ankylosing spondylitis, spondylitis.**



Spondylosis *(Moll, 1997)*

spondylosyndesis. See **spinal fusion.**

spondylothoracic dysplasia. See **Jarcho-Levin syndrome.**

spondylous /spon′diləs/ [Gk, *sphondylos,* vertebra], pertaining to a vertebra.

sponge /spunj/ [Gk, *spongia*], **1.** a resilient absorbent mass used to absorb fluids, to apply medication, or to cleanse. The sponge may be the internal skeleton of a certain marine animal, or it may be manufactured from cellulose, rubber, or synthetic material. **2.** *(informal)* a folded gauze square used in surgery.

sponge bath, the procedure of washing the patient with a damp washcloth or sponge, used when a full bath is not necessary or when lowering of body temperature is required.

sponge gold. See **mat gold.**

spongio-, prefix meaning "like a sponge or related to a sponge": *spongioblast, spongiopilin, spongiosis*.

spongioblastoma /spun′jē·ōblastō′mə/ *pl.* **spongioblastomas, spongioblastomata** [Gk, *spongia* + *blastos,* germ, *oma,* tumor], a neoplasm composed of spongioblasts, embryonic epithelial cells that develop around the neural tube and transform into cells of the supporting connective tissue of nerve cells or cells of lining membranes of the ventricles and the spinal cord canal. Also called **glioblastoma, gliosarcoma, spongiocytoma.**

spongioblastoma multiforme. See **glioblastoma multiforme.**

spongioblastomas, spongioblastomata. See **spongioblastoma.**

spongioblastoma unipolare, a rare neoplasm composed of parallel spongioblasts. The tumor may occur near the third ventricle, in the pons and brainstem, in basal ganglia, or in the terminal filament of the spinal cord.

spongiocytoma. See **spongioblastoma.**

spongiositis. See **periurethritis.**

spongy /spun′jē/ [Gk, *spoggia*], pertaining to or resembling a sponge.

spongy bone. See **cancellous bone.**

spontaneous /spontā′nē·əs/ [L, *sponte,* willingly], occurring naturally and without apparent cause, such as spontaneous remission.

spontaneous abortion, a termination of pregnancy before the twentieth week of gestation as a result of abnormalities of the conceptus or maternal environment. Up to 30% of pregnancies may end as spontaneous abortions, many caused by blighted ova that have congenital defects incompatible with life. Also called **miscarriage.** Compare **induced abortion.**

spontaneous delivery, a vaginal birth occurring without the mechanical assistance of obstetric forceps or vacuum aspirator.

spontaneous evolution. See **Denman's spontaneous evolution, spontaneous version.**

spontaneous fracture, a fracture that occurs without trauma, as a result of bone weakness caused by osteoporosis or by a benign or malignant tumor.

spontaneous generation. See **abiogenesis.**

spontaneous labor, a labor beginning and progressing without mechanical or pharmacological stimulation.

spontaneous PEEP (sPEEP), positive airway pressure applied at the end of the exhalation phase during spontaneous breathing.

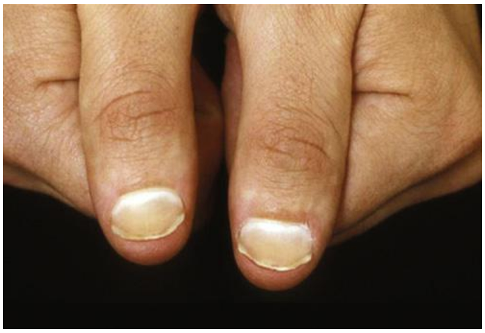
spontaneous phagocytosis [L, *sponte,* free will; Gk, *phagein,* to eat, *kytos,* cell, *osis,* condition], ingestion of antigenic particles by phagocytes of the reticuloendothelial system.

spontaneous pneumothorax [L, *sponte,* free will; Gk, *pneuma,* air, *thorax,* chest], the presence of air or gas in the pleural space as a result of a rupture of the lung parenchyma and visceral pleura with no demonstrable cause.

spontaneous remission, **1.** the reversal of progress of disease without formal treatment. **2.** the disappearance of symptoms of a mentally ill patient without formal treatment.

spontaneous version [L, *sponte,* free will, *vertere,* to turn], a change in the lie of a fetus that occurs without manipulation. Also called **spontaneous evolution.**

spoon nail [AS, *spon* + *naegel*], a nail of the finger or toe that has a thin and concave outer surface.



Spoon nails *(Carey, 2010)*

spor-. See **sporo-.**

sporadic /spôrat′ik/ [Gk, *sporaden,* scattered], (of a number of events) occurring at scattered, intermittent, and apparently random intervals.

-sporangium, suffix meaning an "encasement of spores": *haplosporangium, oosporangium, sporangium*.

spore [Gk, *sporos,* seed], **1.** a reproductive unit of some genera of fungi or protozoa. **2.** a form assumed by some bacteria that is resistant to heat, drying, and chemicals. Under proper environmental conditions the spore may revert to the actively multiplying form of the bacterium. Diseases caused by spore-forming bacteria include anthrax, botulism, gas gangrene, and tetanus.

-spore, suffix meaning a "reproductive element": *archespore, chlamydospore, hemispore*.

sporicidal /spôr′isī′dəl/ [Gk, *sporos,* seed; L, *caedere,* to kill], spore-killing, as are certain chemicals or other agents.

sporicide /spôr′isīd/ [Gk, *sporos* + L, *caedere,* to kill], any agent effective in destroying spores, such as compounds of chlorine and formaldehyde, and the glutaraldehydes.

sporiferous /spôrif′ərəs/, producing or bearing spores.

spork, a spoonlike food utensil with fork tines designed for people with upper extremity disabilities. It can be used as a spoon or a fork.

sporo-, spor-, prefix meaning "spore": *sporocyst, sporogenesis, sporogeny*.

sporoblast /spôr′əblast′/ [Gk, *sporos* + *blastos,* germ], any cell that gives rise to a sporozoite or spore during the sexual reproductive phase of the life cycle of a sporozoon. It refers specifically to the cells resulting from the multiple fission of the encysted zygote of the malarial parasite *Plasmodium,* from which the sporozoites develop.

sporocyst /spôr′əsist/ [Gk, *sporos* + *kystis,* bag], **1.** any structure containing spores or reproductive cells. **2.** a saclike structure, or oocyst, secreted by the zygote of certain protists before sporozoite formation. **3.** the second larval stage in the life cycle of parasitic flukes. The saclike organism develops from the miracidium, or first larval stage, in the body of a freshwater snail host and contains germinal cells that give rise either to daughter sporocysts that develop into cercariae or to rediae. See also **fluke.**

sporogenesis /spôr′ōjen′əsis/ [Gk, *sporos* + *genesis,* origin], **1.** the formation of spores. Also called **sporogeny.** **2.** reproduction by means of spores. —*sporogenic, adj.*

sporogenous /spôroj′ənəs/ [Gk, *sporos* + *genein,* to produce], describing an animal or plant that produces spores or reproduces by way of spores.

sporogeny. See **sporogenesis.**

sporogony /spôrog′ənē/ [Gk, *sporos* + *genesis,* origin], reproduction by means of spores. It refers specifically to the formation of sporozoites during the sexual stage of the life cycle of a sporozoon, primarily the malarial parasite *Plasmodium.* Fusion of the sex cells occurs in the body of the invertebrate host, the female *Anopheles* mosquito in the case of *Plasmodium,* where the encysted zygote undergoes multiple division, giving rise to the sporozoites. Compare **schizogony.**

sporont /spôr′ont/ [Gk, *sporos* + *on,* being], a mature protozoan parasite in the sexual reproductive stage of its life cycle. It undergoes conjugation to form a zygote, which produces sporozoites by multiple fission. Compare **schizont.** See also **sporogony.**

sporonticide /spôron′tisīd/ [Gk, *sporos* + *on* + L, *caedere,* to kill], any substance that destroys sporonts, such as chloroquine and other antimalarial drugs. —*sporonticidal, adj.*

sporophore /spôr′əfôr/ [Gk, *sporos* + *pherein,* to bear], the part of an organism that produces spores.

sporophyte /spôr′əfīt/ [Gk, *sporos* + *phyton,* plant], the asexual, spore-bearing stage in organisms that reproduce by alternation of generations.

sporotrichosis /spôr′ōtrikō′sis/ [Gk, *sporos* + *thrix,* hair, *osis,* condition], a common chronic fungal infection caused by the species *Sporothrix schenckii*. It is usually characterized by skin ulcers and subcutaneous nodules along lymphatic channels. It rarely spreads to involve bones, lungs, joints, or muscles. The most severe symptoms are observed in patients with AIDS. The fungus is found in soil and decaying vegetation and usually enters the skin by accidental injury. Outbreaks have occurred in workers at plant nurseries. Treatment may include amphotericin B in severe cases or itraconazole.

Sporotrichum /spôrot′rikəm/ [Gk, *sporos* + *thrix,* hair], a genus of soil-inhabiting fungi formerly thought to cause sporotrichosis.

Sporozoa /spôr′əzō′ə/ [Gk, *sporos* + *zoon,* animal], a class of parasite in the phylum Protozoa that is characterized by the absence of any external organs of locomotion. Included in this class are the genera ***Toxoplasma*** and ***Plasmodium.***

sporozoite /spôr′əzō′īt/ [Gk, *sporos* + *zoon,* animal], any of the cells resulting from the sexual union of spores during the life cycle of a sporozoon. It refers specifically to the elongated nucleated cells produced by the multiple fission of the zygote contained in the oocyst in the female *Anopheles* mosquito during the sexual reproductive stage of the life cycle of the malarial parasite *Plasmodium*. On release from the oocyst, the sporozoites migrate to the salivary glands of the mosquito, where they are transmitted to humans and develop within the parenchymal cells of the liver as merozoites. Also called **falciform body.** See also **malaria,** ***Plasmodium.***

sport [ME, *disporten,* to amuse], **1.** an individual that differs drastically from its parents or others of its type because of genetic mutation; a mutant. **2.** a genetic mutation. **3.** See **lusus naturae.**

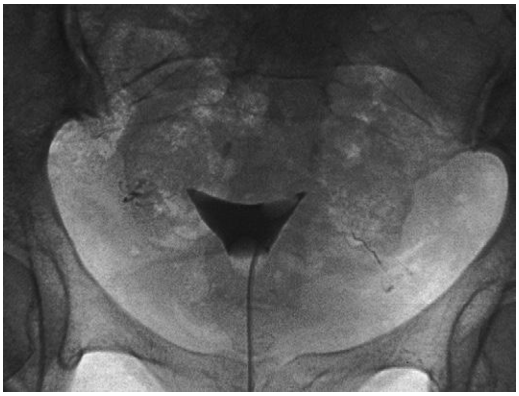
sports-injury prevention: youth, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reducing the risk of sports-related injury in young athletes. See also **Nursing Interventions Classification.**

sports medicine, a branch of medicine that specializes in the prevention and treatment of injuries resulting from training for and participation in athletic events. More than 1 million people are treated for sports injuries each year in the United States. Most sports injuries involve muscle sprains, strains, and tears, which frequently result from inadequate preliminary "warm-up" exercises. Among the most common sports injuries are shin splints, runner's knee, pulled hamstring muscles, Achilles tendonitis, ankle sprain, arch sprain, charley horse, tennis elbow, baseball finger, dislocations, muscle cramps, bursitis, myofascitis, costochondritis, hernia, and "Little League elbow."

sporulation /spôr′yəlā′shən/ [Gk, *sporos* + L, *atus,* process], **1.** a type of reproduction that occurs in fungi, algae, and protozoa and involves the formation of spores by the spontaneous division of a cell into four or more daughter cells, each of which contains a part of the original nucleus. **2.** the formation of a refractile body, or resting spore, within certain bacteria that makes the cell resistant to unfavorable environmental conditions. The cell regains its viability when conditions become favorable. See also **spore.**

spot [ME, blot], (in psychotherapy) a small quantum of space that becomes the territorial object and extension of point behavior.

spot film, a radiograph made instantly during fluoroscopy. The technique may be used to make a permanent record of a transient effect or to record with definition and detail a small anatomical area.



Spot film of contrast media being injected into the uterine cavity *(Bontrager and Lampignano, 2010)*

spotted fever. See **Rocky Mountain spotted fever.**

spotting [ME, *spot,* blot], the appearance of a blood-stained discharge from the vagina between menstrual periods, during pregnancy, or at the beginning of labor.

sprain, a traumatic injury to the tendons, muscles, or ligaments around a joint, characterized by pain, swelling, and discoloration of the skin over the joint. The duration and severity of the symptoms vary with the extent of damage to the tissues. Treatment includes support, rest, and alternating cold and heat. Ultrasound therapy may speed recovery. Radiographic images are often indicated to rule out fractures.

sprain fracture, a fracture that results from the separation of a tendon or ligament at the point of insertion, associated with the separation of a bone at the same insertion site.

sprain of ankle or foot [AS, *ancleow* + *fot*], a sudden traction injury to a muscle, ligament, or capsule in the ankle or foot. The injury is not severe enough to cause a rupture of the tissue.

sprain of back [AS, *baec*], a sudden traction injury to muscles and related tissues of the back. The tissues may have undergone traumatic strain without being ruptured.

spreader bar /spred′ər/, a metal bar with curved hoop areas for attaching hooks or pins for traction.

spreadsheet /spred′shēt/, a computer program that simulates a business or scientific worksheet and performs the necessary calculations when data are entered or changed.

Sprengel's deformity /shpreng′gəlz/ [Otto Gerhard Karl Sprengel, German surgeon, 1852–1915], congenital elevation of the scapula, resulting from failure of descent of the scapula to its normal thoracic position during fetal life.

spring /spring/ [AS, *springan,* to jump], **1.** a piece of resilient metal, such as a hardened coiled steel wire, that will return to its original shape after bending. **2.** a resilient wire attached to a denture or other appliance.

spring forceps [AS, *springan,* to jump], a kind of forceps that includes a spring mechanism. The forceps are tweezerlike and vary in thickness. With teeth, they can grasp delicate tissue. Without teeth, they can hold thick or slippery tissue. Also called **bulldog forceps.**

spring lancet, a very small knife with a spring-triggered blade. It may be used for collecting small specimens of blood for laboratory tests. See also **lancet.**

sprinter's fracture [Swe, *sprinta,* to spurt; L, *fractura,* to break], a break in the anterior superior or anterior inferior spine of the ilium, caused when the bone is forcibly pulled by a violent muscle spasm.

sprue /spro͞o/ [D, *sprouw,* kind of tumor], a chronic degenerative disorder resulting from malabsorption of nutrients from the small intestine and characterized by a broad range of symptoms, including diarrhea; weakness; weight loss; poor appetite; pallor; muscle cramps; bone pain; ulceration of the mucous membrane lining the digestive tract; and a smooth, shiny tongue. It occurs in both tropical and nontropical forms and affects both children and adults. Also called **catarrhal dysentery.** See also **celiac disease, malabsorption syndrome, nontropical sprue, tropical sprue.**

Sprycel, a trademark for **dasatinib.**

SPSS (Statistical Package for the Social Sciences), (in statistics) a computer program often used in research in clinical nursing for the analysis of complex data from large samples.

spur [AS, *spura*], a projection of bone from a body structure or of metal from an appliance. See also **exostosis.**

spurious pregnancy. See **pseudocyesis.**

sputum /spyo͞o′təm/ [L, spittle], material coughed up from the lungs and expectorated through the mouth. It contains mucus, cellular debris, or microorganisms, and it also may contain blood or pus. The amount, color, and constituents of the sputum are important in the diagnosis of many illnesses, including tuberculosis, pneumonia, cancer of the lung, and the pneumoconioses.

sputum collection trap, a plastic trap connected to a suction catheter. Sputum specimens can be contained in the trap and sent for analysis.

Sputum collection trap *(Perry, Potter, and Elkin, 2012)*

sputum culture and sensitivity test, a test for pathogenic bacteria in the sputum of patients with respiratory infections.

sputum cytology, a sputum test to determine the presence of a pulmonary system malignancy. It is used most frequently in patients who have an abnormal chest x-ray, productive cough, and nothing visible on bronchoscopy. A positive test indicates malignancy, but a negative test means only that, if a tumor exists, it is not shedding cells.

sputum specimen [L, spittle + *specere,* to look], a sample of material expelled from the respiratory passages taken for laboratory analysis to determine the presence of pathogens.

squam-, prefix meaning "scales": *squamatization, squamocellular, squamopetrosal.*

squama /skwā′mə/, *pl. squamae,* **1.** a flattened scale from the epidermis. **2.** the thin, expanded part of a bone, especially in the cranial wall.

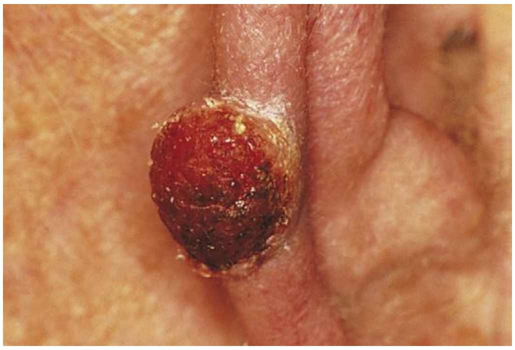
squamocolumnar junction /skwā′mōkəlum′nər/, a region of transition from stratified squamous epithelium to columnar epithelium in the cervical canal. It is a location where cells are obtained for Papanicolaou's (Pap) smears.

squamous /skwā′məs/ [L, *squama,* scale], platelike, scaly, or covered with scales.

squamous blepharitis, a kind of nonulcerative blepharitis in which the edge of the eyelid is covered with small white or gray scales.

squamous cell [L, *squama,* scale, *cella,* storeroom], a flat, scalelike epithelial cell.

squamous cell carcinoma, a slow-growing malignant tumor of squamous epithelium, frequently found in the lungs and skin and occurring also in the anus, cervix, larynx, nose, and bladder. The neoplastic cells characteristically resemble prickle cells and form keratin pearls. Although oral cancer is rare (less than 3% of all cancers), 94% of oral malignancies are squamous cell carcinoma. It may appear as a keratotic plaque; a crusted or noncrusted ulcer; a slightly raised lesion with central ulceration and a rolled border; a red, white or red/white combination velvety area; invasive or burrowing into oral tissues; or a verruciform (multilobulated) growth. The most common intraoral site is the tongue, followed in descending frequency by the soft palate, gingiva, buccal mucosa, labial mucosa, and the hard palate. Lesions may metastasize through the lymph nodes. Treatment and prognosis varies according to site, size and stage of disease progression. Early diagnosis and treatment are essential to increase survival rates. Also called **epidermoid carcinoma.**



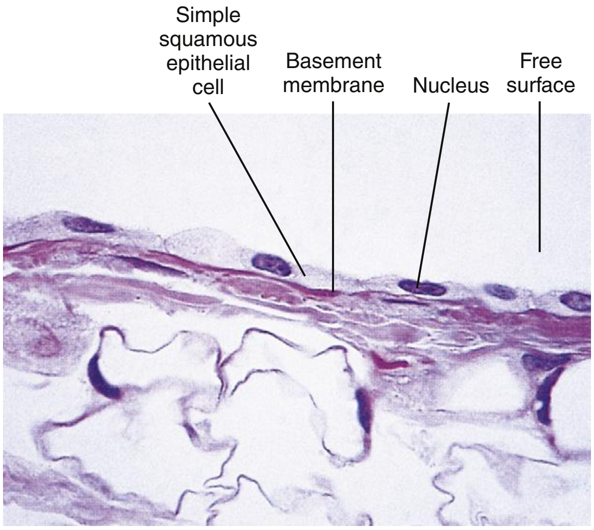
Squamous cell carcinoma *(Courtesy Department of Dermatology, School of Medicine, University of Utah)*

squamous epithelium [L, *squama,* scale; Gk, *epi,* above, *thele,* nipple], a sheet of flattened scalelike cells, attached together at the edges. Also called **pavement epithelium.**

squamous epithelium simple, squamous epithelium having only one layer, such as in endothelium, mesothelium, and pulmonary alveoli. Also called **pavement epithelium,** *tessellated epithelium.*

squamous epithelium stratified, epithelium, such as that of typical skin, having a basal layer of cuboidal cells and overlying layers of squamous cells.

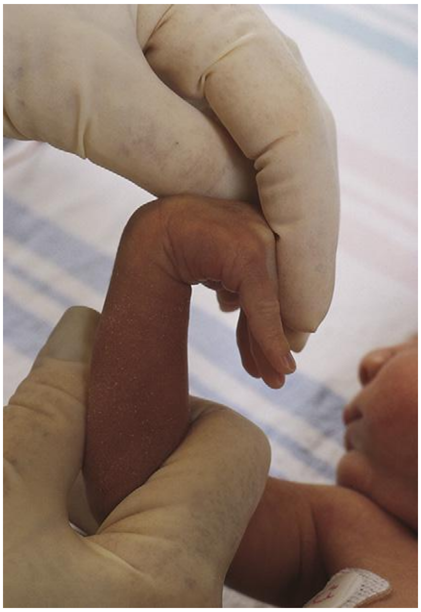
square centimeter (cm^2) /skwer/, a unit of area measurement equivalent to 1 centimeter in length multiplied by 1



Simple squamous epithelium
(© Ed Reschke; used with permission)

centimeter in width, where one centimeter equals 0.3937 inch or 0.03281 foot.

square window [OFr, *esquarre* + ME, *wind,* air, *owe,* eye], an angle of the wrist between the hypothenar prominence and forearm. It is used as a reference point for estimating the gestational age of a newborn.



Square window test
(Murray and McKinney, 2006)

squatting position /skwot′ing/ [Fr, *esquatir,* to press down], a posture in which the knees and hips are flexed and the buttocks are lowered to the level of the heels. It is adopted by children with certain heart diseases as they seek relief from exercise distress.

squeeze dynamometer /skwēz/ [AS, *cwesan,* to press tightly; Gk, *dynamis,* force, *metron,* measure], a device for measuring the muscular strength of the grip of the hand. See also **dynamometer.**

squeeze-film lubrication, the exudation of fluid from the cartilage of joints, forming a film in the transient area of impending contact.

squint. See **strabismus.**

squinting eye /skwin′ting/ [D, *schuinte,* oblique; AS, *eage*], the abnormal eye in a person with strabismus that is not aligned with the fixating eye. See also **strabismus.**

Sr, symbol for the element **strontium.**

SR, abbreviation for **sedimentation rate.**

sRNA, abbreviation for *soluble ribonucleic acid.*

SRO, abbreviation for **single room occupant.**

SRS-A, abbreviation for **slow-reacting substance of anaphylaxis.**

SRY, symbol for a "maleness" gene found on the sex-determining region of the Y chromosome. The gene is believed to function as a master control switch that can turn off or on other genes involved in sexual development.

ss, abbreviation for **steady state.**

SSE, **1.** abbreviation for **skin self-examination. 2.** abbreviation for **soapsuds enema.**

SSKI, a trademark for an expectorant **(potassium iodide).**

SSRI, abbreviation for **selective serotonin reuptake inhibitor.**

SSS, **1.** abbreviation for *sterile saline soak.* **2.** abbreviation for **sick sinus syndrome.**

SSSS, abbreviation for **staphylococcal scalded skin syndrome.**

ST, abbreviation for *slow-twitch.* See **slow-twitch fiber.**

stab [ME, *stabbe,* piercing wound], a neutrophilic band.

stab culture [ME, *stabbe,* piercing wound; L, *colere,* to cultivate], a culture made by dipping a needle into an inoculum and then into a transparent gelatin or agar medium.

stab form. See **band.**

-stabile, suffix meaning "stable, resistant to change": *coctostabile, hydrostabile, tempostabile.*

stabile diabetes. See **type 2 diabetes mellitus.**

stabilization /stab′ilīzā′shən/ [L, *stabilis,* firm, *atus,* process], **1.** the physiological and metabolic process of attaining homeostasis. **2.** the seating of a fixed or removable denture so that it will not tilt or be displaced under pressure. **3.** the control of induced stress loads and the development of measures to counteract such forces so that the movement of the teeth or of a prosthesis does not irritate surrounding tissues.

stabilization exercises, exercises to develop proximal control in symptom (pain)-free positions, such as sitting on a gymnastic ball and extending one knee to maintain balance and control without pain.

stable /stā′bəl/ [L, *stabilis,* firm], remaining unchanged.

stable angina, angina pectoris in which attacks occur with predictable frequency and duration and are precipitated by circumstances such as exercise or emotional stress that increase myocardial oxygen demands. The same circumstances tend to cause the attacks from one episode to another.

stable condition, a state of health or disease from which little if any immediate change is expected.

stable element [L, *stabilis,* firm, *elementum*], a nonradioactive element, one not subject to spontaneous nuclear degeneration. Some kinds of stable elements are calcium, iron, lead, potassium, and sodium. Compare **radioactive element.** See also **element.**

staccato speech /stəkä′tō/ [It, detached; ME, *speche*], abnormal speech in which the person pauses between words, breaking the rhythm of the phrase or sentence. The condition is sometimes observed in association with multiple sclerosis.

stadium /stā′dē·əm/ *pl. stadia* [Gk, *stadion,* racetrack], a significant stage in a fever or illness, such as the fastigium of a febrile illness or the prodromal stage of a viral infection.

Stadol, a trademark for an opioid analgesic **(butorphanol tartrate).**

staff [AS, *staef*], **1.** the people who work toward a common goal and are employed or supervised by someone of higher rank, such as the nurses in a hospital. **2.** a designation by which a staff nurse is distinguished from a nurse manager or other nurse. **3.** (in nursing education) the nonprofessional employees of the institution, such as librarians, technicians, secretaries, and clerks. **4.** (in nursing service administration) the units of the organization that provide service to the line, or administratively defined hierarchy. For example, the personnel office is staff to the chief nurse executive and the nursing service administration.

staff development^1, a process that assists individuals in an agency or organization in attaining new skills and knowledge, gaining increasing levels of competence, and growing professionally. Various resources outside the agency employing the individuals may be used. The process may include such programs as orientation, in-service education, and continuing education.

staff development^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as developing, maintaining, and monitoring competence of staff. See also **Nursing Interventions Classification.**

staffing, the process of assigning people to fill the roles designed for an organizational structure through recruitment, selection, and placement.

staffing pattern, (in hospital or nursing administration) the number and types or categories of staff assigned to the particular units and departments of a hospital or other health care facility. Staffing patterns vary with the unit, department, and shift and with the patient acuity levels.

staff of Æsculapius, a staff carried by Æsculapius, the Greek god of medicine. It is used as the traditional symbol of the physician. A single serpent entwines the staff of Æsculapius. It is often confused with the caduceus, a staff with two serpents (which is the staff of Hermes, the Greek god of commerce and travel), symbolizing (because of this misunderstanding) the U.S. Army Medical Corps. See also **Æsculapius.**

staff supervision, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating the delivery of high-quality patient care by others. See also **Nursing Interventions Classification.**

stage [OFr, *estage*], **1.** a platform. **2.** a period or phase.

-stage, suffix meaning a "(specified) phase": *aecidiostage, multistage, uredostage.*

stages of anesthesia. See **Guedel's signs.**

stages of dying [OFr, *estage,* stage; ME, *dyen,* to lose life], the five emotional and behavioral stages that may occur after a person or family first learns of approaching death. The stages, identified and described by Elisabeth Kübler-Ross, are denial and shock, anger, bargaining, depression, and acceptance. The stages may occur in sequence or they may recur, as the person moves forward and backward—especially among denial, anger, and bargaining. Caring for a dying person requires sensitivity to the signs of each stage. At first, shock may be accompanied by signs of panic. The person may refuse care and deny the diagnosis and prognosis. Denial serves as a defense against the shock. Anger often follows this stage. It is characterized by abusive language, refusal to perform basic self-care responsibilities, negative criticism of anyone who wants to help, and other kinds of angry behavior. The third stage, bargaining, reflects the need of the person for time to accept the situation. A common observation of this period is the patient's attempt to make a bargain, "If I could live until Christmas …" Commonly, the person goes back and forth from anger to bargaining: sometimes silent, sometimes grieving, and sometimes apathetic, depressed, insomniac, and distant. The fourth stage is a time of depression in which the person goes through a period of grieving before death, mourning over past experiences and anticipating impending losses. The final stage, acceptance, is one of inner peace and resolution that death is a certainty. The person may show his or her acceptance by being uninterested in present or future events, being preoccupied with past events, preferring to have few visitors, and wanting quiet and solitude. Nursing care includes administering adequate pain relief, ensuring privacy and dignity, and giving sensitive, honest emotional support to both patient and family. See also **emotional care of the dying patient, hospice.**

staging /stā′jing/, the classification of phases, quantity, or periods of a disease or other pathological process, as in the TMN clinical method of assigning numerical values to various stages of tumor development.

stagnant anoxia /stag′nənt/ [L, *stagnum,* standing water; Gk, *a,* without, *oxys,* sharp, *genein,* to produce], a condition in which there is inadequate blood flow in the capillaries, causing low tissue oxygen tension and reduced oxygen exchange. The condition is associated with shock, cardiac standstill, and thrombosis.

stain [OFr, *desteindre,* to dye], **1.** *n,* a pigment, dye, or substance used to impart color to microscopic objects or tissues to facilitate their examination and identification. Kinds of stains include **acid-fast stain, Gram's stain,** and **Wright's stain. 2.** *v,* to apply pigment to a substance or tissue to examine it under a microscope. **3.** *n,* an area of discoloration.

stained film fault, a defect in a radiograph or photograph that appears as a streaky discoloration or abnormal opacity. It is usually caused by contaminated or exhausted development solutions, improper rinsing, inadequate washing, or damage to the film emulsion during processing.

stalk /stôk/, an elongated, more or less slender anatomical structure resembling the stem of a plant. See also **peduncle, pedunculus.**

-stalsis, suffix meaning a "contraction in the alimentary canal": *antistalsis, peristalsis, retrostalsis.*

stammering [AS, *stamerian,* to stutter], a speech dysfunction characterized by pauses, hesitations, and faltering utterances. The term is not commonly used in clinical practice the United States but is frequently used synonymously with **stuttering** in Great Britain.

stamp cusp [ME, *stampen* + L, *cuspis,* point], a tooth cusp that works in a fossa, such as any of the maxillary lingual cusps.

stance phase of gait [L, *stare,* to stand; Gk, *phainein,* to show; ME, *gate,* a way], the phase of the normal gait cycle that begins with the strike of the heel on the ground and ends with the lift of the toe at the beginning of the swing phase of gait.

standard [OFr, *estandart*], **1.** *n,* an evaluation that serves as a basis for comparison for evaluating similar phenomena or substances, such as a standard for the preparation of a pharmaceutic substance or a standard for the practice of a profession. **2.** *n,* a pharmaceutic preparation or a chemical substance of known quantity, ingredients, and strength that is used to determine the constituents or the strength of another preparation. **3.** *adj,* of known value, strength, quality, or ingredients. **4.** *n,* predetermined criteria used to provide guidance in the operation of a health care facility to ensure high-quality performance by the personnel. **—standardization,** *n.,* **standardize,** *v.*

standard air chamber, a radiation-measuring device used by national and international calibration laboratories to provide exposure calibrations for ion chambers used in the diagnostic or orthovoltage energy range.

standard bicarbonate, the bicarbonate ion concentration of plasma separated anaerobically from whole blood that has been saturated with oxygen and equilibrated at carbon dioxide pressure of 40 torr at 100° F (38° C). It is a measure of the metabolic disturbance of acid-base balance in a sample of blood after the correction of any respiratory disturbance.

standard curve, a graphic plot of tracer binding versus the known concentration of test substances in a set of standards usually prepared by serial dilution or incremental addition.

standard death certificate, a form for a death certificate that is commonly used throughout the United States. It is the form preferred by the U.S. Census Bureau.

standard deviation (SD), (in statistics) a mathematic statement of the dispersion of a set of values or scores from the mean.

standard environmental chamber. See **Skinner box.**

standard error (S.E.), (in statistics) the variability in scores that can be expected if measurements are made on random samples of the same size from the same universe of populations, phenomena, or observations. The standard error provides a framework within which a determination of the difference between groups may be made. It is an element used in determining statistic significance by means of a wide variety of formulas and methods.

standard error of the mean, (in statistics) an indication of how well the mean of a sample estimates the mean of a population. It is measured by the standard deviation of the means of randomly drawn samples of the same size as the sample in question.

standard gravity (g), the acceleration caused by gravity at mean sea level, 9.80616 meters per second squared.

standard hydrogen electrode, a reference electrode that is assigned a value of 0.00 volt. Also called **normal hydrogen electrode.**

standardization, standardize. See **standard.**

standardized death rate, the number of deaths per 1000 people of a specified population during 1 year. This rate is adjusted to prevent distortion by the age composition of the population. A standard population is used for determining this rate. Also called **adjusted death rate.**

standardized test, any empirically developed examination with established reliability and validity as determined by repeated evaluation of the method and results.

standard of care, a written statement describing the rules, actions, or conditions that direct patient care. Standards of care guide practice and can be used to evaluate performance.

standard precautions, guidelines recommended by the Centers for Disease Control and Prevention for reducing the risk of transmission of blood-borne and other pathogens in hospitals. The standard precautions synthesize the major features of universal precautions (designed to reduce the risk of transmission of blood-borne pathogens) and body substance isolation (designed to reduce the risk of pathogens from moist body substances) and apply them to all patients receiving care in hospitals regardless of their diagnosis or presumed infection status. Standard precautions apply to (1) blood; (2) all body fluids, secretions, and excretions *except sweat,* regardless of whether or not they contain blood; (3) nonintact skin; and (4) mucous membranes. The precautions are designed to reduce the risk of transmission of microorganisms from both recognized and unrecognized sources of infection in hospitals. See also **transmission-based precautions.** Compare **Universal Precautions.**

standard reference gamble, a method of diagnostic testing in which a decision maker is faced with a choice between a certain outcome or intermediate value and a gamble involving a better or worse outcome. The outcomes are assigned arbitrary numeric values of 100 and 0, respectively. All other outcomes can be assigned values relative to the best and worst outcomes.

standards of nursing practice, a set of guidelines for providing high-quality nursing care and criteria for evaluating care. Such guidelines help assure patients that they are receiving high-quality care. The standards are important if a legal dispute arises over the quality of care provided a patient.

standby guardianship, a legal process in the United States that may name an individual to assume specified health care or financial authority for an elderly person who becomes mentally incapacitated.

standing orders [L, *stare,* to stand, *ordo,* rank], a written document containing rules, policies, procedures, regulations, and orders for the conduct of patient care in various stipulated clinical situations. The standing orders are usually formulated collectively by the professional members of a department in a hospital or other health care facility. Standing orders usually name the condition and prescribe the action to be taken in caring for the patient, including the dosage and route of administration for a drug or the schedule for the administration of a therapeutic procedure. Standing orders are commonly used in intensive care units, coronary care units, and emergency departments.

stann-, prefix meaning “tin”: *stanniferous, stanniform, stannoxyl*.

stannous fluoride /stan′əs/ [L, *stannum,* tin, *fluere,* to flow], SnF_2, a substance used in prevention of dental caries, applied topically to the teeth.

stanolone /stan′o-lōn/, a semisynthetic form of dihydrotestosterone, which has been used as an androgenic and anabolic steroid.

stanozolol /stənō′zəlol/, an androgenic anabolic steroid.

■ INDICATIONS: It is prescribed in the treatment of hereditary angioedema.

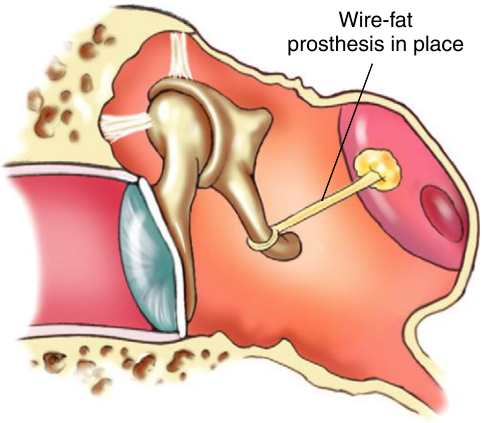
■ CONTRAINDICATIONS: Cancer of the breast or prostate, nephrosis, pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are various androgenic effects in males and females, hypoestrogenic effects in females, and allergic reactions. GI disturbances may also occur.

St. Anthony’s fire. See **ergot poisoning.**

stape-, prefix meaning “stapes”: *stapedial, stapedectomy*.

stapedectomy /stā′pədek′təmē/ [L, *stapes,* stirrup; Gk, *ektomē,* excision], the removal of the stapes of the middle ear and insertion of a graft and prosthesis, performed to restore hearing in cases of otosclerosis. The stapes that has become fixed is replaced so that vibrations again transmit sound waves through the oval window to the fluid of the inner ear. The stapes is removed and the opening into the inner ear is covered with a graft of body tissue. One end of a small plastic tube or piece of stainless steel wire is attached to the graft. The other end is attached to the two remaining bones of the middle ear, the malleus and the incus. Headache and dizziness are expected early in the postoperative period. The patient’s hearing does not improve until the edema subsides and the packing is removed. Possible complications include infection of the outer, middle, or inner ear; displacement or rejection of the graft or the prosthesis; and leaking of perilymph around the prosthesis into the middle ear, with ringing in the ear and dizziness. Compare **incudectomy.**



Stapedectomy
(LaFleur Brooks and LaFleur Brooks, 2012)

stapedius /stəpē′dē·əs/, a small muscle on the wall of the tympanic cavity of the middle ear. It acts reflexively in response to loud sounds to reduce excessive vibrations that could injure the internal ear by pulling the head of the stapes posteriorly out of the oval window.

stapes /stā′pēz/ [L, stirrup], one of the three ossicles in the middle ear, resembling a tiny stirrup, that fits into the oval window. It transmits sound vibrations from the incus to the internal ear. Compare **incus, malleus.** See also **middle ear.**

Staphcillin, a trademark for an antibacterial (methicillin sodium).

staph marginal disease. See **eczematous conjunctivitis.**

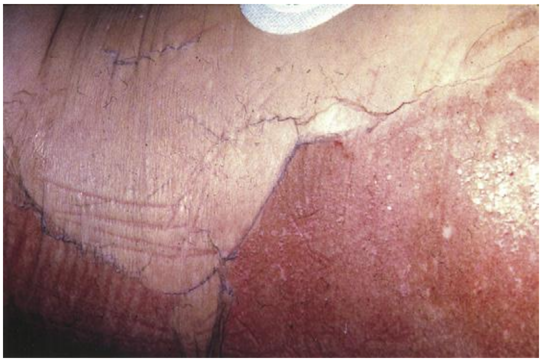
staphyl-, staphylo-, **1.** prefix meaning "grapelike clusters or conditions of the uvula": *staphyloplasty, staphyloncus.* **2.** prefix meaning "a micrococcal infection": *staphylolysin, staphyloderm.*

staphylococcal. See ***Staphylococcus.***

staphylococcal infection [Gk, *staphyle,* bunch of grapes, *kokkos,* berry; L, *inficere,* to taint], an infection caused by any one of several pathogenic species of *Staphylococcus,* commonly characterized by the formation of abscesses of the skin or other organs. Staphylococcal infections of the skin include carbuncles, folliculitis, furuncles, and hidradenitis suppurativa. Bacteremia is common and may result in endocarditis, meningitis, or osteomyelitis. Staphylococcal pneumonia often follows influenza or other viral disease and may be associated with chronic or debilitating illness. Acute gastroenteritis may result from an enterotoxin produced by certain species of staphylococci in contaminated food. Treatment usually includes bed rest, analgesics, and an antimicrobial drug that is resistant to penicillinase, an enzyme secreted by many species of *Staphylococcus.* Surgical drainage, especially of deep abscesses, is often necessary.

staphylococcal pneumonia [Gk, *staphyle* + *kokkos* + *pneumon,* lung], pneumonia caused by a staphylococcus infection.

staphylococcal scalded skin syndrome (SSSS), an infection or mucous membrane colonization with toxin-producing *Staphylococcus aureus.* It is characterized by epidermal erythema, peeling, and necrosis, which give the skin a scalded appearance. This disorder primarily affects infants 1 to 3 months of age and children, but it may also affect adults. SSSS is more common in the newborn because of undeveloped immunity and renal systems. Treatment of SSSS commonly includes the administration of systemic antibiotics to prevent secondary infections and the replacement of body fluids to maintain fluid and electrolyte balance. Compare **toxic epidermal necrolysis.**



Staphylococcal scalded skin syndrome
(Goldman et al, 2008)

staphylococcemia /-koksē′mē·ə/, **1.** the presence of staphylococci in the blood. **2.** septicemia caused by staphylococci.

Staphylococcus /staf′ilōkok′əs/ *pl.* staphylococci [Gk, *staphyle* + *kokkos,* berry], a genus of nonmotile spheric gram-positive bacteria. Some species are normally found on the skin and in the throat. Certain species cause severe purulent infections or produce an enterotoxin, which may cause nausea, vomiting, and diarrhea. Life-threatening staphylococcal infections may arise within hospitals. *Staphylococcus aureus* is a species frequently responsible for abscesses, endocarditis, impetigo, osteomyelitis, pneumonia, and septicemia. *S. epidermidis,* formerly called *S. albus,* occasionally causes endocarditis in the presence of intracardiac prostheses. See also **staphylococcal infection. —staphylococcal,** *adj.*

Staphylococcus aureus [Gk, *staphyle* + *kokkos* + L, *aurum,* gold], a species of ***Staphylococcus*** that produces a golden pigment with some color variations and is commonly found on the skin or nose of healthy people. It is also responsible for a number of pyogenic infections, such as boils, carbuncles, and abscesses. *S. aureus* infections have become increasingly more difficult to treat because of the development of resistance to penicillin-related antibiotics. These bacteria are called *methicillin-resistant S. aureus* or MRSAs.

staphylokinase /staf′ilōkī′nās/, an enzyme, produced by certain strains of staphylococci, that catalyzes the conversion of plasminogen to plasmin in various animal hosts of the microorganism.

staphyloma /staf′ilō′mə/, a bulging of eye contents through a thin region of the cornea or sclera.

staphylopharyngorrhaphy. See **palatopharyngorrhaphy.**

staple /stā′pəl/, a piece of stainless steel wire used to close certain surgical wounds.

Staples *(Perry, Potter, and Elkin, 2012)*

stapling [ME, *stapel,* stake], a method of fastening tissues together at the end of surgery by using a U-shaped piece of wire as a suture. The ends of the wire are bent toward the center to close the staple.

starch [AS, *stearc,* strong], a polysaccharide composed of long chains of glucose subunits. It is the principal molecule used for the storage of energy in plants. See also **carbohydrate, glucose, glycogen.**

Stargardt's macular degeneration, an autosomal-recessive type of macular degeneration usually occurring from 6 to 20 years of age and marked by abnormal pigmentation and other changes in the macular area with rapid loss of visual acuity.

Starling's law of the heart. See **Frank-Starling relationship.**

Starr-Edwards prosthesis [Albert Starr, American physician, b. 1926; M.L. Edwards, American physician, b. 1906; Gk, *prosthesis,* attachment], an artificial cardiac valve. A caged-ball form of device, it obstructs the valve opening and prevents the backward flow of blood. See also **prosthesis.**

start codon. See **initiation codon.**

start hesitation, a characteristic of parkinsonism in which the patient has difficulty initiating walking movements, as if the feet were stuck to the floor.

startle reflex /stär′təl/ [ME, *stertlen,* to rush; Gk, *syn,* together, *dromos,* course], a reflex response to a sudden unexpected stimulus that may be accompanied by physiological effects such as increased heartbeat and respiration, closing of the eyes, and flexion of trunk muscles. The reaction is rapid, pervasive, and uncontrollable, regardless of the unexpected stimulus, which may be as simple as a touch. It is a normal reflex in neonates. However, premature and immature infants may not show the reaction. Also called **startle reaction, startle syndrome.** See also **Moro reflex.**

start point [ME, *sterte* + L, *punctum,* prick], the initial nucleotide transcribed from a DNA template in the formation of messenger RNA.

starvation /stärvā′shən/ [ME, *sterven,* to die], **1.** a condition resulting from the lack of essential nutrients over a long period (several days) and characterized by multiple physiological and metabolic dysfunctions. **2.** the act or state of starving or being starved. See also **malnutrition.**

stas-, prefix meaning "stopped, or relation to standing or walking": *stasibasiphobia, stasidynic, stasis.*

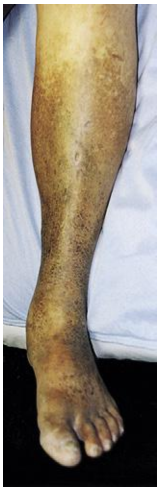
-stasia, -stasis, **1.** suffix meaning a "(specified) condition involving the ability to stand": *ananastasia, astasia, dysstasia.* **2.** suffix meaning "(condition of) stoppage or inhibition": *cholestasia, hemostasia, menostasia.*

stasibasiphobia /stas′ibas′ifō′bē·ə/, a mental health condition in which a person is convinced that walking or standing is physically impossible. The person may also express a morbid distrust of his or her ability to stand or walk.

stasis /stā′sis, stas′is/ [Gk, standing], **1.** a disorder in which the normal flow of a fluid through a vessel of the body is slowed or halted. **2.** stillness.

-stasis. See **-stasia.**

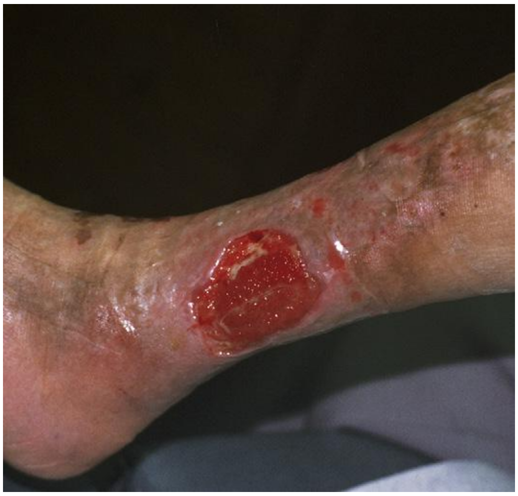
stasis dermatitis, a common result of venous insufficiency of the legs beginning with ankle edema and progressing to tan pigmentation, patchy erythema, petechiae, and induration. Ultimately, there may be atrophy and fibrosis of the skin and subcutaneous tissue, with ulcerations that are slow to heal. The tan pigment is hemosiderin from blood leaking through capillary walls under elevated venous pressure. The involved skin is easily irritated or sensitized to topical medications. The underlying venous insufficiency must be treated. The dermatitis is often treated by bed rest, Burow's solution for oozing lesions, antibiotics for infection, and corticosteroids for reduction of inflammation. Also called **venous stasis dermatitis.** See also **stasis ulcer.**



Stasis dermatitis *(Black and Hawks, 2005)*

stasis syndrome, overgrowth of bacteria in the small intestine resulting from a variety of conditions causing stasis, particularly disturbances to intestinal motility or decreased acid secretion but also structural abnormalities such as diverticula, fistulae between the colon and upper bowel, or chronic obstruction. It is characterized by malabsorption of vitamin B_{12}, steatorrhea, and anemia. Also called **bacterial overgrowth syndrome, blind loop syndrome.**

stasis ulcer, a necrotic craterlike lesion of the skin of the lower leg caused by chronic venous congestion. The ulcer is often associated with stasis dermatitis and varicose veins. Healing is slow, and care to prevent irritation and infection is essential. Bed rest, elevation, and pressure bandages are usually ordered, and antibiotics if needed for infection. Surgery to improve venous flow may be useful in some cases. Also called **varicose ulcer.** See also **stasis dermatitis.**



Stasis ulcer *(Black and Hawks, 2009)*

stat., abbreviation for the Latin word *statim,* "immediately."

-stat, **1.** suffix meaning a "device for keeping something stationary": *catheterostat, hysterostat, ophthalmostat.* **2.** suffix meaning an "instrument for the regulation of" something specified: *hemostat, rheostat, thermostat*. **3.** suffix meaning an "apparatus for the reflection of, in one direction of" something specified: *siderostat*. **4.** suffix meaning a "device for studying in a state of rest": *hydrostat, microstat, orbitostat*. **5.** suffix meaning an "agent for stopping the growth of": *bacteriostat, mycostat, fungistat*.

state /stāt/ [L, *status,* condition], the circumstances or qualities that characterize a person, thing, or way of being at a particular time.

-state, suffix meaning the "result of a (specified) process": *anastate, catastate, mesostate*.

State Board Test Pool Examination (SBTPE), revised and retitled in 1982 as the NCLEX-RN, an examination prepared by the National Council of State Boards of Nursing for testing the competency of a person to perform safely as a newly licensed registered nurse. Each jurisdiction within the United States and its territories regulates entry into the practice of nursing; each requires the candidate to pass the examination. The content of the examination is planned to test the candidate's knowledge of the nursing process as applied to the broad areas of nursing practice, including maternal and child health, medical and surgical nursing, and psychiatric nursing. The process includes five steps: assessing, analyzing, planning, implementing, and evaluating. Knowledge, comprehension, application, and analysis of the nursing process are tested as they apply to decision-making situations.

state medicine. See **socialized medicine.**

State Nurses Association (SNA), an association of nurses at the state level. The various State Nurses Associations are constituent units of the American Nurses Association.

Statewide Health Coordinating Committee (SHCC), a component of the U.S. national network of Health Systems Agencies.

static /stat′ik/ [Gk, *statikos,* causing to stand], without motion, at rest, in equilibrium. Compare **dynamic.**

static cardiac work, the energy transfer that occurs during the development and maintenance of ventricular pressure immediately before the opening of the aortic and pulmonary valves.

static electricity film fault, a defect in a radiograph or a developed photographic film that appears as lightning-like streaks. It is caused by overly rapid opening of the film packet or transfer of static electricity from the user to the film.

static equilibrium, the ability of an individual to adjust to displacements of his or her center of gravity while maintaining a constant base of support.

static imaging, **1.** a diagnostic procedure for visualizing an internal organ or body compartment. A radioactive substance is administered to a patient, and an image or set of images is made of the fixed or slowly changing distribution of the radioactivity. **2.** any diagnostic image that is fixed or frozen in time.

static labyrinth, the vestibule of the inner ear. It contains two communicating chambers, the saccule and the utricle, and elicits tonic reflexes on postural muscles in response to changes in head and body positions.

static pressure [Gk, *statikos,* causing to stand; L, *premere,* to press], a condition of equalized blood pressure throughout the body when the heartbeat is stopped. A nonmoving fluid exerts a uniform pressure in all directions.

static reflex [Gk, *statikos,* causing to stand; L, *reflectere,* to bend back], a reflex that helps one maintain normal posture and muscle tone when the body is at rest.

static retinoscopy, a type of retinoscopy in which the patient fixes the gaze on an unmoving target at a long distance to relax accommodation.

static scoliosis [Gk, *statikos,* causing to stand, *skoliosis,* curvature], a form of scoliosis resulting from a difference in the length of the legs.

static symptom. See **passive symptom.**

static tremor, irregular involuntary muscle contractions that occur when a patient makes an effort to hold the trunk or limbs in certain positions.

statin. See **HMG-CoA reductase inhibitor.**

station /stā′shən/ [L, *stare,* to stand], the level of the biparietal plane of the fetal head relative to the level of the ischial spines of the maternal pelvis. An imaginary plane at the level of the spines is designated "zero station." Higher and lower stations are numbered at intervals of 1 cm and labeled as minus above and plus below. For example, "station minus three" is 3 cm above the spines, and "station plus two" is 2 cm below the spines. In breech presentation, the bitrochanteric diameter of the breech is used to determine station. See also **dilation, effacement, labor.**

stationary grid /stā′shəner′ē/ [L, *stare* + ME, *gridere,* gridiron], an x-ray grid that does not move or oscillate during the exposure of a radiographic film. The image of the lead strips that compose the grid appears on the radiograph.

stationary lingual arch, an orthodontic arch wire that is designed to fit the lingual surface of the teeth and is soldered to the associated anchor bands.

statistic /stetis′tik/ [L, *status,* condition], a number that describes a property of a set of data or other numbers.

statistical model of patient evaluation, a system based on gross quantitative measurements of similar cases used to determine payment for services.

Statistical Package for the Social Sciences. See **SPSS.**

statistical significance [L, *status,* condition, *significare,* to signify], an interpretation of statistical data that indicates that an occurrence was probably the result of a causative factor and not simply a chance result. Statistical significance at the 1% level indicates a 1 in 100 probability that a result can be ascribed to chance.

statistics /stətis′tiks/, a mathematic science concerned with measuring, classifying, and analyzing objective information.

statotonic reflex. See **attitudinal reflex.**

status /stā′təs, stat′əs/ [L, condition], **1.** a specified state or condition, such as emotional status. **2.** an unremitting state or condition, such as status asthmaticus.

status asthmaticus, an acute, severe, and prolonged asthma attack. It is caused by critically diminished airway diameter resulting from ongoing bronchospasm, edema, and mucous plugging. Hypoxia, cyanosis, and unconsciousness may follow, and the attack may be fatal. Treatment includes supplemental oxygen given to correct hypoxemia, bronchodilators given intravenously or by aerosol inhalation, corticosteroids, mechanical ventilation, sedation, frequent therapy, and emotional support. See also **allergic asthma, asthma.**

status dysraphicus. See **dysraphia.**

status epilepticus, a medical emergency characterized by continuous seizures lasting more than 30 minutes without interruption. Status epilepticus can be precipitated by the sudden withdrawal of anticonvulsant drugs, inadequate body levels of glucose, a brain tumor, a head injury, a high fever, or poisoning. Therapy includes IV administration of anticonvulsant drugs, nutrients, and electrolytes. An adequate airway is usually maintained with a nasopharyngeal or endotracheal tube.

status lacunaris. See **lacunar state.**

status marmoratus, the presence in full-term infants of basal nucleus lesions resulting from acute total asphyxia. The lesions have a marbled appearance caused by neuronal loss and an overgrowth of myelin in the putamen, caudate, and thalamus.

statute of limitations /stach′o͞ot/ [L, *statuere,* to set up, *limes,* boundary], (in law) a statute that sets a limit of time during which a suit may be brought or criminal charges may be made. In a malpractice suit, dispute may arise as to whether the time set by the particular statute of limitations begins to run at the time of the injury or at the time of the discovery of the injury.

statutory rape /stach′ətôr′ē/ [L, *statuere,* to place, *rapere,* to seize], (in law) sexual intercourse with a female below the age of consent, which varies from state to state. See also **rape.**

stavudine, a synthetic thymidine nucleoside analog.

■ INDICATIONS: It is prescribed in combination with other drugs for the treatment of adults with advanced human immunodeficiency virus (HIV) infection, generally those who are intolerant of other approved therapies.

■ CONTRAINDICATIONS: Hypersensitivity to this drug or to any of its components prohibits its use.

■ ADVERSE EFFECTS: The side effects most often reported include peripheral neuropathies (occur more commonly than with comparable medications), elevation of hepatic transaminase levels, headache, chills, fever, asthenia, abdominal pain, diarrhea, nausea, and vomiting.

STD, abbreviation for **sexually transmitted disease.**

steady state (s, ss) /sted′ē/ [AS, *stedefast,* firm in its place; L, *status,* condition], a basic physiological concept implying that the various forces and processes of life are in a state of homeostasis. Living organisms are in constant flux, working to balance the internal and external environments in an effort to prevent a deficiency or an excess that might cause illness. Steady state is a complete state of well-being involving total adaptation.

steam sterilization [ME, *steme,* vapor; L, *sterilis,* barren], the destruction of all forms of microbial life on an object by exposing the object to moist heat for 15 minutes at 121° F (49.44° C) under high pressure.

steap-. See **stearo-.**

steapsin, pancreatic expase.

stear-, prefix pertaining to fat. See **stearo-.**

-stearic, suffix meaning "(specified) fat or fat derivatives": *aleostearic, ketostearic, neurostearic.*

Stearns' alcoholic amentia /sturnz/ [A. Warren Stearns, American physician, 1885–1959; Ar, *alkohl,* essence; L, *ab,* from, *mens,* mind], a form of insanity brought on by alcohol, characterized by an emotional disturbance of a less severe nature than that of delirium tremens but of longer duration and with greater mental clouding and amnesia.

stearo-, steap-, stear-, steato-, prefix meaning "fat": *stearoconotum, stearodermia, stearopten.*

stearrhea [Gk, *stear,* fat, *rhoia,* flow], excessive secretion of fat.

stearyl alcohol, a solid substance, prepared by the catalytic hydrogenation of stearic acid, used in various ointments.

steato-. See **stearo-.**

steatorrhea /stē′ətərē′ə/ [Gk, *stear,* fat, *rhoia,* flow], greater than normal amounts of fat in the feces, characterized by frothy foul-smelling fecal matter that floats, as in celiac disease, some malabsorption syndromes, and any condition in which fats are poorly absorbed by the small intestine.

steatorrhea simplex. See **seborrhea.**

Steele-Richardson-Olszewski syndrome [John C. Steele, Canadian neurologist; J. Clifford Richardson, Canadian neurologist, b. 1909; Jerzy Olszewski, Canadian neurologist, 1913–1966]. See **progressive supranuclear palsy.**

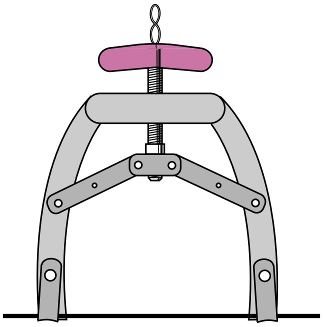
steeple head. See **oxycephaly.**

steering wheel injury, a traumatic injury, most commonly to the anterior chest wall, caused by forward propulsion of the body of an automobile driver into the steering wheel during a collision. Injuries include broken ribs and sternum, cardiac and pulmonary damage, and tearing of major blood vessels.

Steinert's disease. See **myotonic muscular dystrophy.**

Stein-Leventhal syndrome. See **polycystic ovary syndrome.**

Steinmann pin /stīn′mən/ [Fritz Steinmann, Swiss surgeon, 1872–1932; AS, *pinn*], a wide-diameter pin used for heavy skeletal traction, as in the tibia or femur.



Steinmann pin *(Perry, Potter, and Elkin, 2012)*

Stelazine, a trademark for a phenothiazine antipsychotic agent (trifluoperazine).

stell-, prefix meaning "star": *stellate, stellectomy, stellula.*

stellate /stel′it, -āt/ [L, *stella,* star], star-shaped or arranged in the pattern of a star.

stellate fracture, a fracture in which there are numerous fissures radiating from the central point of impact or injury throughout surrounding bone tissue.

stellate ganglion [L, *stella,* star; Gk, *gagglion,* knot], a large irregular ganglion on the lowest part of the cervical sympathetic trunk fused with the first thoracic ganglion. Its branches communicate with the seventh and eighth cervical nerves. Also called **cervicothoracic ganglion.**

stem cell [AS, *stemm,* tree, trunk; L, *cella,* storeroom], a formative cell; a cell whose daughter cells may give rise to other cell types. A **pluripotential stem cell** is one that has the potential to develop into several different types of mature cells, including lymphocytes, granulocytes, thrombocytes, and erythrocytes. See also **hematopoietic stem cell.**

stem cell leukemia, a neoplasm of blood-forming organs in which the predominant malignant cell is too immature to classify. The acute disease has a rapid, relentless course. Also called **embryonal leukemia, hemoblastic leukemia, hemocytoblastic leukemia, lymphoidocytic leukemia, undifferentiated cell leukemia.**

stem cell lymphoma. See **undifferentiated malignant lymphoma.**

steno-, prefix meaning "short, contracted, or narrow": *stenobregmate, stenocephaly, stenothorax.*

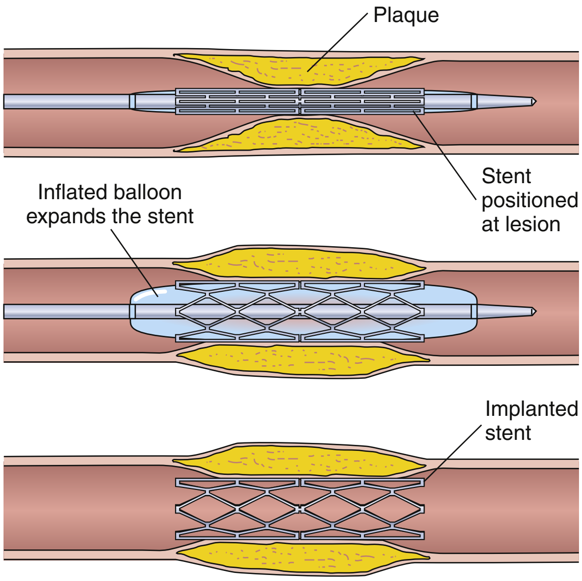
stenosis /stinō′sis/ [Gk, *stenos,* narrow, *osis,* condition], an abnormal condition characterized by the constriction or narrowing of an opening or passageway in a body structure. The term is commonly used to describe heart valve and vessel abnormalities as well as narrowing of joint spaces, as in cervical stenosis. Kinds of stenosis include **aortic stenosis** and **pyloric stenosis. —stenotic,** *adj.*

-stenosis, suffix meaning "narrowed or constricted": *angiostenosis, aortostenosis.*

stenotic [Gk, *stenos,* narrow], pertaining to a structure that is narrowed or strictured.

Stensen's duct. See **parotid duct.**

stent [Charles R. Stent, nineteenth-century English dentist], **1.** a compound used in making dental impressions and medical molds. **2.** a mold or device made of stent, used in anchoring skin grafts. **3.** a rod or threadlike device for supporting tubular structures during surgical anastomosis or for holding arteries open during angioplasty.



Plaque
Stent positioned at lesion
Inflated balloon expands the stent
Implanted stent

Coronary artery stent *(Lewis et al, 2011)*

step-care therapy, a therapeutic program that begins with a simple, conservative type of treatment but may advance to more complex stages as needed to achieve control of a disease or disorder. An example is step-care therapy of hypertension, in which the first step is limited to nonpharmacological treatments such as weight control, low-salt diet, and exercise. If the first step fails to produce results, the next step may be the prescription of diuretics, followed by the use of beta blockers, angiotensin-converting enzyme inhibitors, or other drugs, until an effective form of treatment is found.

steppage gait /step′ij/ [AS, *staepe* + ONorse, *gata,* way], a gait in which the legs are raised abnormally high, as in patients with footdrop.

stepping reflex. See **dance reflex.**

step reflex. See **dance reflex.**

stepwedge /step′wej/, an aluminum device that, when exposed to x-rays, displays a range of exposure intensities on a radiograph. These exposure "steps" are analyzed to determine the speed characteristics of the radiographic film. Also called **penetrometer.**

Sterapred, a trademark for a glucocorticoid **(predniSONE).**

sterco-, prefix meaning "feces": *stercobilin, stercolith, stercoremia.*

stereo-, prefix meaning "solid, three dimensional, or firmly established": *stereoblastula, stereograph, stereopsis.*

stereognosis /stir′·ē·ōgnō′sis/ [Gk, *stereos,* solid, *gnosis,* knowledge], **1.** the faculty of perceiving and understanding the form and nature of objects by the sense of touch. **2.** perception by the sense of the solidity of objects. **—***stereognostic, adj.*

stereognostic perception /stir′ē·ōgnos′tik/ [Gk, *stereos,* solid, *gnosis,* knowledge], the ability to recognize objects by the sense of touch.

stereoisomer /stir′ē·ō·ī′səmər/ [Gk, *stereos,* solid, *isos,* equal, *meros,* part], one of two or more chemical compounds that contain the same atoms linked in the same way but that are organized differently in space. For example, one may be the nonsuperimposable mirror image of the other.

stereoisomeric specificity /-ī′səmer′ik/ [Gk, *stereos* + *isos,* equal, *meros,* part], specificity of an enzyme for one enantiomer of a racemic mix.

stereoophthalmoscope /stir′·ē·ō′ofthal′məskōp/, an ophthalmoscope fitted with two eyepieces so that the examiner can view the three-dimensional interior of the eye.

stereopsis. See **depth perception.**

stereoradiograph. See **stereoscopic radiograph.**

stereoradiography /-ra′dē·og′rəfē/ [Gk, *stereos* + L, *radiare,* to emit rays; Gk, *graphein,* to record], a technique for producing radiographs that give a three-dimensional view of an internal body structure. The stereoradiographs are produced by combining two separate x-ray films, each made from a slightly different angle without movement of the body part being x-rayed. The developed films are then viewed through a device that allows the two images to be perceived as one.

stereoscopic microscope /-skop′ik/ [Gk, *stereos* + *skopein,* to look], a microscope that produces three-dimensional images through the use of double eyepieces and double objectives. The three-dimensional image is created because the double optic systems have independent light paths. Also called **Greenough microscope.**

stereoscopic parallax. See **binocular parallax.**

stereoscopic radiograph, a composite of two radiographs made through **stereoradiography.** Also called **stereoradiograph.**

stereotactic mammography, a radiographic procedure using three-dimensional breast imaging to perform a needle breast biopsy and differentiate a benign from a malignant lesion. The three-dimensional imaging assists in locating the lesion and placement of the needle.

stereotactic radiosurgery. stereotaxic surgery in which lesions are produced by ionizing radiation. Also called **stereotaxic radiosurgery.** See also **stereotactic surgery.**

stereotactic surgery. any of several techniques for the production of sharply circumscribed lesions in specific tiny areas of pathological tissue in deep-seated structures of the central nervous system. The site to be worked on is localized with three-dimensional coordinates. Methods of producing lesions include heat, cold, x-rays, and ultrasound. Also called **stereotaxic surgery.**

stereotaxic instrument /-tak′sik/, an apparatus that fits on the head and helps locate structures in the brain by means of coordinates.

stereotaxic neuroradiography [Gk, *stereos* + *taxis,* arrangement, *neuron,* nerve; L, *radiare,* to emit rays; Gk, *graphein,* to record], a radiographic procedure commonly performed during neurosurgery to guide the insertion of a needle into a specific area of the brain.

stereotaxic radiosurgery. See **stereotactic radiosurgery.**

stereotaxic surgery. See **stereotactic surgery.**

stereotype /stir′ē·ətīp/ [Gk, *stereos* + *typos,* mark], a generalization about a form of behavior, an individual, or a group.

stereotypical. See **stereotypy.**

stereotypic behavior /stir′ē·ōtip′ik/, a pattern of body movements that has autistic and symbolic meaning for an individual. It may occur in persons with schizophrenia.

stereotypy /ster′ē·ətī′pē/ [Gk, *stereos* + *typos*, mark], the persistent, inappropriate mechanical repetition of actions, body postures, or speech patterns, usually occurring with a lack of variation in thought processes or ideas. It is often seen in patients with schizophrenia. **—stereotypical,** *adj.*

sterile /ster′il/ [L, *sterilis*, barren], **1.** free of living microorganisms. **2.** barren; unable to produce children because of a physical abnormality, often the absence of spermatogenesis in a man or blockage of the fallopian tubes in a woman. Compare **impotence. —sterility,** *n.* **3.** aseptic.

sterile field, **1.** a specified area, such as within a tray or on a sterile towel, that is considered free of microorganisms. **2.** an area immediately around a patient that has been prepared for a surgical procedure. The sterile field includes the scrubbed team members, who are properly attired, and all furniture and fixtures in the area.

sterile meningitis [L, *sterilis*, barren; Gk, *meninx*, membrane, *itis*, inflammation], a form of nonbacterial meningitis, which usually involves a viral infection but also may be drug-induced, in which there is a primarily lymphocytic response in the cerebrospinal fluid. Also called **benign lymphocytic meningitis, simple meningitis.** See also **aseptic meningitis.**

sterile technique. See **aseptic technique.**

sterile water for inhalation, water for injection that is sterilized and contains no antimicrobial agents, except when used in devices in which it is liable to contamination over a period of time (e.g., humidifiers), or other added substances. It is for inhalation therapy only, not for parenteral administration.

sterile water for irrigation, water for injection that is sterilized and contains no antimicrobial agents or other added substances. It is used for irrigation but not for parenteral administration.

sterility /stəril′itē/ [L, *sterilis*, barren], a condition of being unable to conceive or reproduce the species.

sterility assurance level (SAL), the probability that a process makes something sterile. An SAL of 10^{-6} is the recommended probability of survival for organisms on a sterilized device. This level means that there is less than or equal to one chance in a million that an item remains contaminated or nonsterile. See also **sterilization.**

sterilization /ster′ilīzā′shən/ [L, *sterilis* + Gk, *izein*, to cause], **1.** a process or act that renders a person unable to produce children. See also **hysterectomy, tubal ligation, vasectomy. 2.** a technique for destroying microorganisms or inanimate objects using heat, water, chemicals, or gases. **—sterilize,** *v.*

sterilize /ster′ilīz/ [L, *sterilis*, barren], **1.** to make powerless to reproduce (infertile), such as by surgery. **2.** to destroy all living organisms and viruses in a material.

sternal /stur′nəl/ [Gk, *sternon*, chest], pertaining to the sternum.

-sternal, suffix meaning "sternum": *adsternal, presternal, suprasternal.*

sternal node [Gk, *sternon*, chest; L, *nodus*, knot], a node in one of the three groups of thoracic parietal lymph nodes. They are situated at the anterior ends of the intercostal spaces, adjacent to the internal thoracic artery. The afferent vessels of the sternal nodes drain the lymph from the breast, the diaphragmatic surface of the liver, and the deep ventral thoracic wall. Also called **internal mammary node.** Compare **diaphragmatic node, intercostal node.** See also **lymphatic system, lymph node.**

sternal puncture [Gk, *sternon*, chest; L, *punctura*], a diagnostic procedure in which a needle is inserted into the marrow of the sternum to remove bone marrow samples for diagnosis.

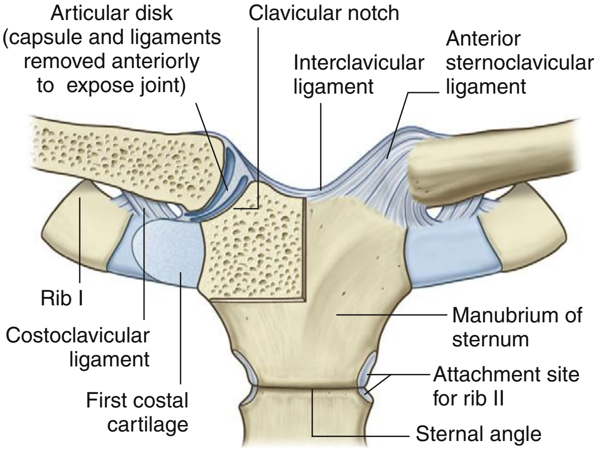
Sternberg-Reed cell. See **Reed-Sternberg cell.**

Sternheimer-Malbin stain /sturn′hīmər mal′bin/, a crystal violet and safranin stain used in urinalyses to provide additional contrast for certain casts and cells.

-sternia, suffix meaning "(condition of the) sternum": *asternia, koilosternia, schistosternia.*

sterno-, prefix meaning "sternum": *sternocleidal, sternocostal, sternopagus.*

sternoclavicular /stur′nōklavik′yələr/ [Gk, *sternon*, chest; L, *clavicula*, little key], pertaining to the sternum and clavicle. Also called **sternocleidal.**



Articular disk (capsule and ligaments removed anteriorly to expose joint)
Clavicular notch
Interclavicular ligament
Anterior sternoclavicular ligament
Rib I
Costoclavicular ligament
First costal cartilage
Manubrium of sternum
Attachment site for rib II
Sternal angle

Sternoclavicular joint *(Drake, Vogl, and Mitchell, 2010)*

sternoclavicular articulation [Gk, *sternon* + L, *clavicula*, little key], the double gliding joint between the sternum and the clavicle. It involves the sternal end of the clavicle, the superior and lateral part of the manubrium, the cartilage of the first rib, and six ligaments.

sternocleidal. See **sternoclavicular.**

sternocleidomastoid /-klī′dōmas′toid/ [Gk, *sternon*, chest, *kleis*, key, *mastos*, breast, *eidos*, form], a muscle of the neck that is attached to the mastoid process of the temporal bone and to the superior nuchal line and by separate heads to the sternum and clavicle. They function together to flex the head. Also called **sternomastoid.**

sternocostal articulation /-kos′təl/ [Gk, *sternon* + L, *costa*, rib], the gliding articulation of the cartilage of each true rib and the sternum, except the articulation of the first rib, in which the cartilage is directly united with the sternum to form a synchondrosis. Each sternocostal articulation also involves five ligaments.

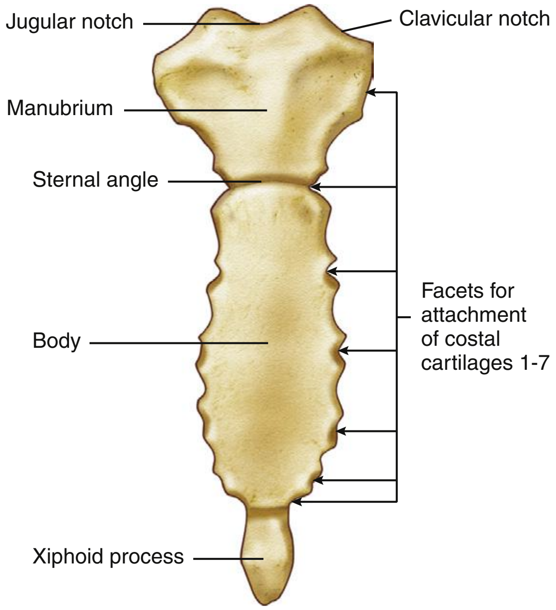
sternohyoideus /stur′nōhī·oi′dē·əs/ [Gk, *sternon* + *hyoeides*, upsilon, U-shaped], one of the four infrahyoid muscles. It acts to depress the hyoid bone. Also called **sternohyoid muscle.** Compare **sternothyroideus.**

sternomastoid. See **sternocleidomastoid.**

sternopericardial ligaments, ligaments that attach the fibrous pericardium to the posterior surface of the sternum and help to retain the heart in its position in the thoracic cavity.

sternothyroideus /stur′nōthīroi′de·əs/ [Gk, *sternon* + *thyreos*, shield, *eidos*, form], one of the four infrahyoid muscles. It acts to depress the thyroid cartilage. Also called **sternothyroid muscle.** Compare **sternohyoideus.**

sternum /stur′nəm/ [Gk, *sternon*], the elongated flattened bone forming the middle part of the thorax. It supports the clavicles; articulates directly with the first seven pairs of ribs; and comprises the manubrium, the gladiolus (body), and the xiphoid process. It is composed of highly vascular tissue covered by a thin layer of bone.



Sternum

sternutation. See **sneeze.**

steroid /stir′oid/ [Gk, *stereos* + *eidos,* form], any of a large number of hormonal substances with a similar basic chemical structure, produced mainly in the adrenal cortex and gonads. Steroids are chemically related to sterols.

steroid acne [Gk, *stereos,* solid; L, *oleum,* oil; Gk, *eidos,* form, *akme,* point], a form of acne caused by the use of corticosteroids.

steroid cell antibody, an immunoglobulin G glycoprotein that interacts with antigens in the cytoplasm of gonadal or adrenal cells that produce steroids.

steroid hormone [Gk, *stereos,* solid; L, *oleum,* oil; Gk, *eidos,* form, *hormaein,* to set in motion], a ductless gland secretion that contains the basic steroid nucleus in its chemical formulae. The natural steroid hormones include androgens, estrogens, and adrenal cortex secretions.

steroid hormone therapy [Gk, *stereos* + L, *oleum,* oil; Gk, *eidos,* form, *hormaein,* to set in motion, *therapeia,* treatment], treatment with any of the steroid hormones, such as the use of estrogen to reduce symptoms of postmenopausal disorders.

steroidogenesis /stiroi′dōjen′əsis/, the biological synthesis of steroid hormones.

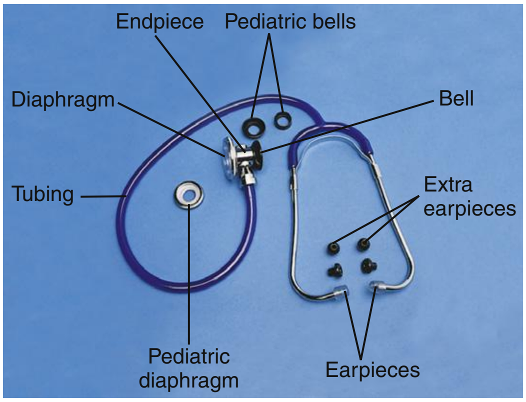
sterol /stir′ôl/ [Gk, *stereos* + Ar, *alkohl,* essence], a large subgroup of steroidal compounds which consists of a series of fused carbocyclic rings containing a hydroxyl group at position 3 and a branched aliphatic side chain of eight or more carbon atoms at position 17. Kinds of sterols include **cholesterol** and **ergosterol.**

stertorous /stur′tərəs/ [L, *stertere,* to snore], **1.** pertaining to a respiratory effort that is strenuous or struggling. **2.** having a snoring sound.

stetho-, steth-, prefix meaning "the chest": *stethometer, stethomyitis, stethospasm.*

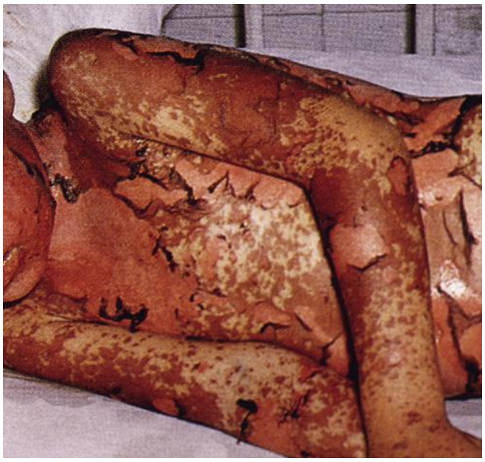
stethomimetic /steth′ōmimet′ik/, pertaining to any condition causing or associated with a reduction of chest volume below its normal value. The condition may be congenital, temporary, or permanent.

stethoscope /steth′əskōp/ [Gk, *stethos,* chest, *skopein,* to look], an instrument consisting of two earpieces connected by means of flexible tubing to a diaphragm, which is placed against the skin of the patient's chest or back to hear heart and lung sounds. It is also used to hear bowel sounds.



Stethoscope *(Harkreader, Hogan and Thobaben, 2007)*

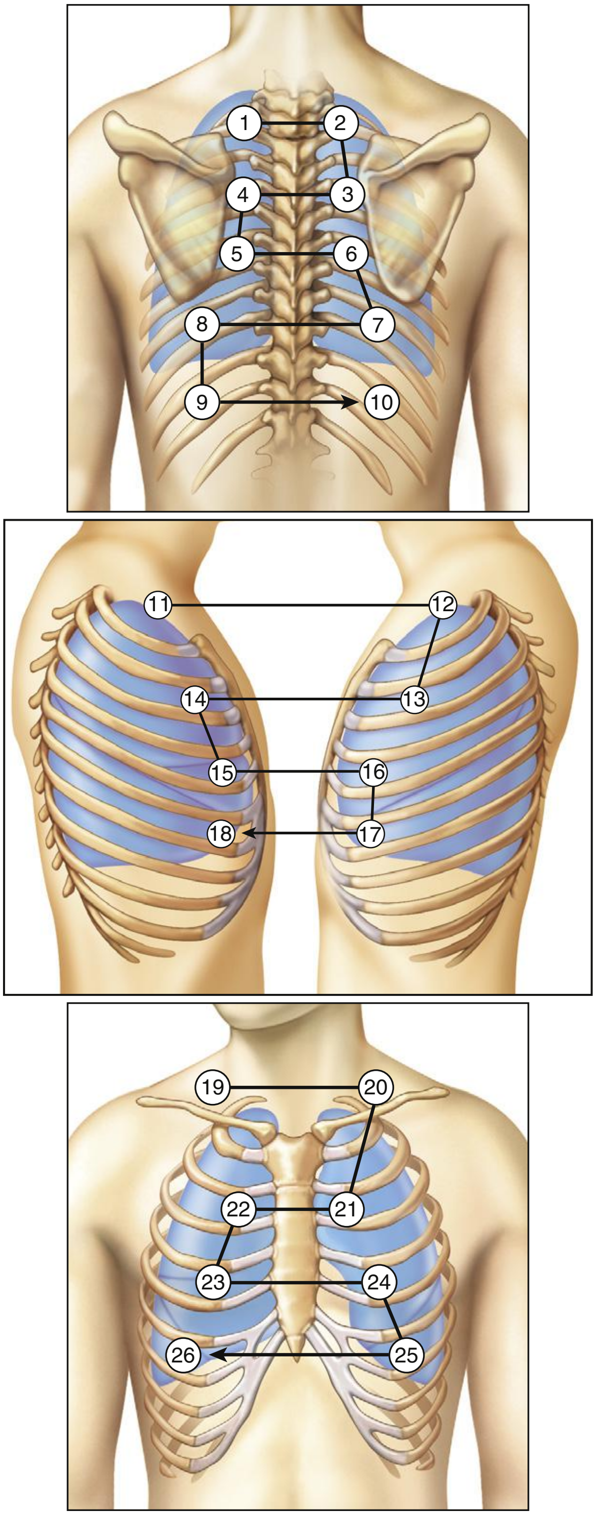
Stevens-Johnson syndrome [Albert M. Stevens, American pediatrician, 1884–1945; F.C. Johnson, American physician, 1894–1934], a serious, sometimes fatal inflammatory disease affecting children and young adults. It is characterized by the acute onset of fever; bullae on the skin; and ulcers on the mucous membranes of the lips, eyes, mouth, nasal passage, and genitalia. Other complications are pneumonia, pain in the joints, prostration, and perforation of the cornea. It may be an allergic reaction to certain drugs, or it may follow pregnancy, infection by herpesvirus I, or other infection. It is seen rarely in association with malignancy or radiation therapy. Treatment includes bed rest, antibiotics for pneumonia, glucocorticoids, analgesics, mouthwashes, and sedatives. See also **erythema multiforme.**



Stevens-Johnson syndrome
(Baren, 2008)

Stewart, Isabel Maitland, (1878–1963), a Canadian-born American nursing educator and writer. The first nurse to receive a master's degree from Columbia University in New York, she succeeded Mary Adelaide Nutting as Professor of Nursing at Teachers College at that university. She was instrumental in upgrading the nursing curriculum and in directing educational policies and became an important figure in international nursing affairs.

STH, abbreviation for *somatotropic hormone*. See **growth hormone.**



Stethoscope placement for auscultation of lung sounds *(Harkreader, Hogan and Thobaben 2007)*

sthen-. See **stheno-.**

-sthenia, suffix meaning “power or strength”: *angiosthenia, eusthenia, hyposthenia.*

sthenic fever /sthen′ik/ [Gk, *sthenos,* power; L, *febris,* fever], high body temperature associated with thirst, dry skin, and often delirium.

stheno-, sthen-, prefix meaning “strength”: *sthenometer, sthenoplastic, sthenopyra.*

-sthenuria, suffix meaning “(condition of) urination or of the specific gravity of urine”: *hypersthenuria, isosthenuria, normosthenuria.*

stib-, prefix meaning “antimony”: *stibamine, stibophen, stiburea.*

stibogluconate sodium /stib′ōglo͞o′kənāt/, an antileishmanial. It is a drug of choice for the visceral form of leishmaniasis and has some effect on other forms.

stich-, -stichia, combining form meaning “rows”: *polystichia, stichochrome.*

Stickler’s syndrome /stik′lərz/ [Gunnar B. Stickler, American physician, 20th century], an autosomal-dominant disorder consisting of myopia progressing to retinal detachment and blindness and premature degenerative changes in the joints. Sensorineural hearing loss may also occur.

sticky end. See **cohesive terminus.**

Stieda’s fracture /stē′dəz/ [Alfred Stieda, German surgeon, 1869–1945], a break in the internal condyle of the femur.

stiff [OE, *stif*], characterized by rigidity or muscular inflexibility.

stiff joint [OE, *stif* + L, *jungere,* to join], a rigid or inflexible joint, as may be caused by tight connective tissue or by arthritis or other rheumatic disorders.

stiff lung. See **adult respiratory distress syndrome.**

stiff-man syndrome, a condition of unknown cause characterized by progressive fluctuating rigidity of axial and limb muscles in the absence of signs of cerebral and spinal cord disease but with continuous electromyographic activity.

stigma /stig′mə/ *pl.* stigmas, stigmata [Gk, brand], **1.** a moral or physical blemish. **2.** a mental or physical characteristic that serves to identify a disease or a condition.

stigmatism /stig′mətiz′əm/ [Gk, *stigma,* brand], **1.** normal visual accommodation and refraction whereby light rays fall onto the retina. **2.** a condition of abnormal skin markings.

stilbestrol. See **diethylstilbestrol.**

stilet, stilette. See **stylet.**

stillbirth [AS, *stille* + ME, *burth*], **1.** the birth of a fetus that died before or during delivery. **2.** a fetus, born dead, who weighs more than 500 g and would usually have been expected to live.

stillborn [AS, *stille* + *boren*], **1.** *n,* an infant who was born dead. **2.** *adj,* pertaining to an infant who was born dead.

Still’s disease. See **juvenile rheumatoid arthritis.**

stimulant /stim′yələnt/ [L, *stimulare,* to incite], any agent that increases the rate of activity of a body system.

stimulant cathartic, a cathartic that acts by promoting the motility of the bowel, especially the longitudinal peristalsis of the colon. The class of stimulant cathartics includes **cascara sagrada** and **senna.**

stimulate /stim′yəlāt/ [L, *stimulare,* to incite], to excite, as in the process of increasing a vigorous functional activity.

stimulating bath, a bath taken in water that contains an aromatic substance, an astringent, or a tonic.

stimulation /stim′yəlā′shən/ [L, *stimulare,* to incite], the condition of being stimulated.

stimulus /stim′yələs/ *pl. stimuli* [L, *stimulare,* to incite], anything that excites or incites an organism or part to function, become active, or respond. **—stimulate,** *v.*

stimulus control, a strategy for self-modification that depends on manipulating the causes of behavior to increase goals or behaviors desired by a patient while decreasing those that are undesired.

stimulus duration, the length of time a stimulus must be applied for the resulting nerve impulse to produce excitation in the receptor tissue. In general, more intense stimuli require shorter excitation times to effect cellular response. Any stimulus that acts too briefly to overcome the threshold intensity of the receptor cell will not elicit a response.

stimulus generalization, a type of conditioning in which the reaction to one stimulus is reinforced to allow transfer of the reaction to other occurrences.

sting [AS, *stingan*], an injury caused by a sharp, painful penetration of the skin, often accompanied by exposure to an irritating chemical or the venom of an insect or other animal. In cases of hypersensitivity, a highly venomous sting, or multiple stings, anaphylactic shock may occur. Kinds of stings include bee, jellyfish, scorpion, sea urchin, and shellfish stings. See also **stingray, wasp.**

stingray /sting′rā/ [AS, *stingan* + L, *raia,* ray-fish], a flat, long-tailed fish bearing barbed spines on its back that are connected to sacs of venom. Spasm of the skeletal muscles, severe local pain, seizures, and dyspnea may occur if a person's skin is broken by the spines. See also **sea urchin sting.**

stippling [D, *stippen,* to prick], **1.** the appearance of colored dots in some cells when stained. Red stippling in blood cells stained with eosin hematoxylin is a sign of malaria. Blue stippling in red blood cells stained with Wright's stain can be a sign of lead poisoning. **2.** the appearance of the retina, as if dotted with light and dark points. See also **gingival stippling.**

stitch [ME, *stiche*], **1.** a suture. **2.** a sudden sharp pain.

stitch abscess [ME, *stiche* + L, *abscedere,* to go away], an abscess that develops around a suture.

stitch granuloma, a foreign-body granuloma occurring around a buried nonabsorbable suture.

St. John's wort, an herb that is native to Europe and Asia, also now grown in the United States.

■ USES: It is used as an antidepressant and antiviral. It has demonstrated efficacy against mild depression and certain other mood disturbances but does not have demonstrable antiviral efficacy.

■ CONTRAINDICATIONS: It is not recommended during pregnancy and lactation, in children, or in those with known hypersensitivity to this product.

St. Louis encephalitis /sānt lo͞o′is/ [St. Louis, Missouri; Gk, *enkephalon,* brain, *itis,* inflammation], a flavovirus infection of the brain transmitted from birds to humans by the bite of an infected mosquito. It occurs most commonly in the central and southern parts of the United States and is characterized by headache, malaise, fever, stiff neck, delirium, and convulsions. Sequelae may include visual and speech disturbances, difficulty in walking, and personality changes. Convalescence may be prolonged, and death may result. No antivirus agent or vaccine is available. Treatment is supportive. Compare **California encephalitis, equine encephalitis.** See also **encephalitis.**

stochastic effects, effects produced at random without a threshold dose level, the probability of their occurrence being proportional to the dose and their severity being independent of it. In radiation safety, the main stochastic effects are carcinogenesis and genetic mutation.

stocking aid. See **sock aid.**

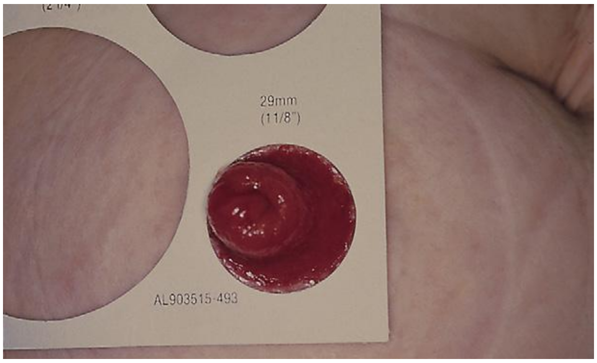
stock vaccine, an immunizing agent made from a stock microbial strain.

stoker's cramp. See **heat cramp.**

Stokes-Adams syndrome. See **Adams-Stokes syndrome.**

-stole, suffix meaning "contraction, retraction, or dilation of various organs": *anastole, diastole, peristole.*

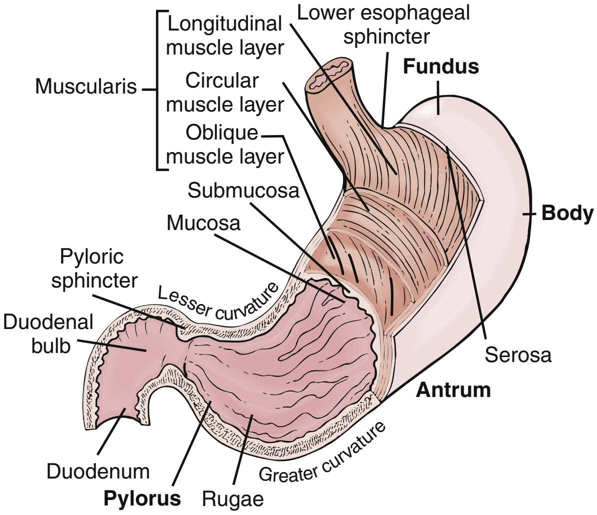
stoma /stō′mə/ *pl. stomas, stomata* [Gk, mouth], **1.** a pore, orifice, or opening on a surface. **2.** an artificial opening of an internal organ on the surface of the body created surgically, such as for a colostomy, ileostomy, or tracheostomy. **3.** a new opening created surgically between two body structures, such as for a gastroenterostomy, pancreaticogastrostomy, pancreatoduodenostomy, or pyeloureterostomy.



Colostomy stoma
(Potter and Perry, 2013)

-stoma, -stome, suffix meaning a "mouth or opening": *hypostoma, metastoma, tetrastoma.*

stomach /stum′ək/ [Gk, *stomakhos,* gullet], the food reservoir and first major site of digestion, located just under the diaphragm and divided into a body and a pylorus. It receives partially processed food and drink funneled from the mouth through the esophagus and gradually feeds liquefied food (chyme) into the small intestine. The stomach lies in the epigastric and left hypogastric regions bounded by the anterior abdominal wall and the diaphragm between the liver and the spleen. The shape of the stomach is modified by the amount of contents, stage of digestion, development of gastric musculature, and condition of the intestines. It is lined with a mucous coat, a submucous coat, a muscular coat, and a serous coat, all richly supplied with blood vessels and nerves, and contains fundic, cardiac, and pyloric gastric glands. Also called **gaster.**



Stomach *(Lewis et al, 2007)*

stomachache [Gk, *stomakhos,* gullet; ME, *aken,* pain], pain in the stomach area. Also called **gastralgia, gastrodynia,** *stomachalgia.*

stomach cancer. See **gastric cancer.**

stomach drops, a medication that promotes gastric activity.

stomach pump, a pump for withdrawing the contents of the stomach through a tube passed through the mouth or nose into the stomach.

stomach tube, a tube used to introduce nutrients into the stomach, remove fluids and ingested poisons, or decompress the stomach. Also called **gastrostomy tube, G tube.**

stomach wall, the layered structure that makes up the stomach, consisting of a serous coat, a muscular coat, a mucous membrane, and other tissue layers in between.

stomadaeal, stomadaeum, stomadeal, stomadeum. See **stomodeum.**

stomal /stō′məl/ [Gk, mouth], pertaining to one or more stomata or mouthlike openings. Also spelled **stomatal.**

stomal peptic ulcer, a marginal peptic ulcer. See also **marginal peptic ulcer, peptic ulcer.**

stomas, stomata. See **stoma.**

stomatal. See **stomal.**

stomatitis /stō′mətī′tis/ [Gk, *stoma* + *itis,* inflammation], any inflammatory condition of the mouth. It may result from infection by bacteria, viruses, or fungi; from exposure to certain chemicals or drugs; from vitamin deficiency; or from a systemic inflammatory disease. Kinds of stomatitis include **aphthous stomatitis, pseudomembranous stomatitis, thrush,** and **Vincent's infection.** See also **candidiasis.**

stomatitis parasitica [Gk, *stoma,* mouth, *itis,* inflammation, *parasitos,* guest], an inflammation of the mucous membranes of the mouth by a yeast fungus, *Candida albicans,* typically expressed by a white coating on the tongue. It may affect infants or immunosuppressed people with human immunodeficiency virus or appear as an outgrowth secondary to antibiotic therapy. Also called **thrush.**

stomato-, stomo-, prefix meaning "mouth": *stomatodysodia, stomatogastric, stomatopathy.*

stomatocyte /sto′mah-to-sīt/, an abnormal red blood cell in which a slit or mouthlike area replaces the normal central zone of pallor, often due to edema.

stomatocytosis /sto′mah-to-si-to′sis/, the presence of stomatocytes in the blood, as seen in liver disease and Rh-null syndrome, a rare congenital hemolytic anemia. Also called **hydrocytosis.**

stomatognathic system /stō′mətōnath′ik/ [Gk, *stoma* + *gnathos,* jaw, *systema*], the combination of organs, structures, and nerves involved in speech and reception, mastication, and deglutition of food. This system is composed of the teeth, the jaws, the masticatory muscles, the tongue, the lips, the surrounding tissues, and the nerves that control these structures.

stomatology /stō′mətol′əjē/ [Gk, *stoma* + *logos,* science], the study of the morphological characteristics, structure, function, and diseases of the oral cavity. —*stomatologic, stomatological, adj., stomatologist. n.*

-stome. See **-stoma.**

-stomia, suffix meaning "(condition of the) mouth": *atelostomia, atretostomia, hygrostomia.*

stomion /stō′mē·on/ [Gk, *stoma*], the median point of the oral slit when the mouth is closed.

stomo-. See **stomato-.**

stomodeum /stom′ədē′əm/ *pl. stomodeums, stomodea* [Gk, *stoma* + *odaios,* a way], a depression in the ectoderm located in the foregut of the developing embryo that forms the mouth. Also spelled **stomadaeum, stomadeum, stomodaeum.** Compare **proctodeum.** —*stomadeal, stomodaeal, stomodeal, adj.*

-stomy, suffix meaning "surgical opening": *gastrostomy, lobostomy, tracheostomy.*

stone. See **calculus.**

-stone, suffix meaning a "calculus in a human organ or duct": *bilestone, gallstone, wombstone.*

stone disease, urolithiasis that may have complications when obstructive uropathy or infection develops. See also **urinary calculus.**

stone retrieval basket, a tiny apparatus consisting of several wires that can be advanced through an endoscope into a body cavity or tube, manipulated to trap a calculus or other object, and withdrawn.

stool. See **feces.**

stool culture, a test to determine whether a patient has a bacterial or viral infection of the bowel or parasites.

stool for occult blood test (stool for OB), a stool test performed as part of every routine physical examination to detect the presence of occult blood in the GI tract. Presence of OB in the stool may indicate benign and malignant GI tumors, ulcers, inflammatory bowel disease, arteriovenous malformation, diverticulosis, and hematobilia.

stool softener. See **fecal softener.**

stop [AS, *stoppian,* to stop], a consonantal speech sound produced by closing off the oral cavity and then releasing with a burst of air, such as an initial /p/. Also called **plosive.**

stopcock, a valve or turning plug that controls the flow of fluid from a container through a tube. A three-way stopcock can be used on IV tubing to turn off one solution and turn on another.

stop needle [AS, *stoppian,* to stop, *naedel*], a needle with a shoulder flange that prevents it from penetrating beyond a certain distance.

storage capacity /stôr′ij/, the amount of data that can be held on a computer disk or tape, usually expressed in kilobytes (one thousand bytes), megabytes (one million bytes), gigabytes (one billion bytes), or terabytes (one trillion bytes).

storage disease, a metabolic disorder in which certain cells accumulate excessive amounts of lipids, proteins, or other substances.

storage pool, the area of a platelet organelle, such as a dense body or an alpha granule, where specific chemical constituents are stored.

storage pool disease, inadequate number or contents of platelet delta-granules causing mucocutaneous bleeding. Storage pool disease is usually hereditary and related to oculocutaneous albinism syndromes such as Hermansky-Pudlak syndrome, Chediak-Higashi syndrome, and Wiskott-Aldrich syndrome.

stored-energy foot, a lower-limb prosthesis designed to imitate the springlike action of a natural foot and leg. A device in the prosthesis stores energy when weight is put on the prosthesis. When the weight is shifted to the other leg, the stored energy is released, returning the prosthesis to its original shape.

stork bite. See **telangiectatic nevus.**

storm fermentation [OE, *sturm, storm;* L, *fermentum,* leaven], the rapid gaseous clotting of milk caused by *Clostridium perfringens.*

Stoxil, a trademark for an antiviral **(idoxuridine).**

STP. *slang.* **1.** a psychedelic agent, dimethoxy-4-methylamphetamine. **2.** abbreviation for *serenity, tranquility, and peace.*

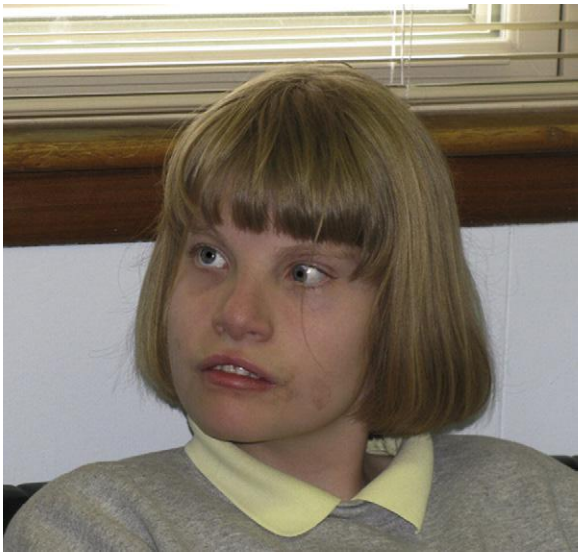
STPD conditions of a volume of gas, (*s*tandard *t*emperature, standard *p*ressure, *d*ry) the conditions of a volume of gas at 0° C and 760 torr that contains no water vapor (dry). It should contain a calculable number of moles of a particular gas.

Str., abbreviation for ***Streptococcus.***

strab-, prefix meaning "squinting": *strabismometer, strabismus, strabometry.*

strabismal /strabiz′məl/ [Gk, *strabismos,* squint], pertaining to the condition of strabismus.

strabismus /strəbiz′məs/ [Gk, *strabismos,* squint], an abnormal ocular condition in which the visual axes of the eyes are not directed at the same point. There are two kinds of strabismus, paralytic and nonparalytic. Paralytic strabismus results from the inability of the ocular muscles to move the eye because of neurological deficit or muscular dysfunction. The muscle that is dysfunctional may be identified by watching as the patient attempts to move the eyes to each of the cardinal positions of gaze. If the affected eye cannot be directed to a position, the examiner infers that the associated ocular muscle is the dysfunctional one. Because this kind of strabismus may be caused by tumor, infection, or injury to the brain or the eye, an ophthalmological examination is recommended. Nonparalytic strabismus is a defect in the position of the two eyes in relation to each other. The condition may be inherited. The person cannot use the two eyes together but has to fixate with one or the other. The eye that looks straight at a given time is the fixing eye. Some people have alternating strabismus, using one eye and then the other; some have monocular strabismus, which affects only one eye. Visual acuity diminishes with diminished use of an eye, and suppression amblyopia may develop. Nonparalytic strabismus and suppression amblyopia are treated most successfully in early childhood. The primary treatment to prevent amblyopia consists mainly of covering the fixing eye, forcing the child to use the deviating eye. The earlier it is begun, the more rapid and effective is the treatment. The eyes might be straightened by surgery, but suppression amblyopia will not be corrected. Also called **squint.** See also **anoopsia, esotropia, exotropia.** **—strabismal,** *strabismic, strabismical, adj.*



Strabismus

(Wittman and Vallone, 2009)

straddle injury, injury to the distal urethra by falling astride a blunt object, such as bicycle handlebars or the top of a fence or railing.

straddling embolism. See **saddle embolism.**

straight chiropractic, the practice of chiropractic in strict accordance with the principles of its founder, D.D. Palmer, without additions made by later practitioners. The original definition of subluxation as a vertebral displacement is adhered to, and chiropractic is considered to be nontherapeutic, its purpose being solely to contribute to health by the correction of vertebral subluxations.

straight-leg-raising (SLR) test, a physical examination technique to determine abnormality of the sciatic nerve or tightness of the hamstrings. The presence of sciatica is confirmed by sciatic nerve pain radiating down the limb when the supine person attempts to raise the straightened limb.

straight line blood set /strāt/ [ME, *streght*], a common device, composed of plastic components, for delivering blood infusions. It includes plastic tubing, a clamp, a drip chamber, and a filter. Some kinds of straight-line blood sets contain filters within drip chambers; others have separate filters. The latter kind can be filled by squeezing the attached drip chamber, but it must not be squeezed itself or it may rupture. The former kind can be filled by squeezing the section of the blood set that contains the filter and the drip chamber. Before infusion, the filter of either kind is tapped with the fingers to dislodge any trapped air bubbles. Compare **component drip set, component syringe set, microaggregate recipient set, Y-set.**

straight sinus [ME, *streght* + L, *sinus,* hollow], one of the six posterior-superior venous channels of the dura mater that drain blood from the brain into the internal jugular vein. It has no valves and is located at the junction of the falx cerebri with the tentorium cerebelli. Compare **inferior sagittal sinus, superior sagittal sinus, transverse sinus.**

straight wire fixed orthodontic appliance, a fixed orthodontic appliance used for correcting and improving malocclusion. It is a variation of the edgewise orthodontic appliance. Its design and placement of arch wire brackets and tubes are intended to limit the need for arch wire adjustments.

strain [ME, *streinen*], **1.** *v,* to exert physical force in a manner that may result in injury, usually muscular. **2.** *v,* to separate solids or particles from a liquid with a filter or sieve. **3.** *n,* damage, usually muscular, that results from excessive physical effort. **4.** *n,* a taxon that is a subgroup of a species. **5.** *n,* an emotional state reflecting mental pressure or fatigue.

straitjacket /strāt′jakit/ [OFr, *estreit,* strict, *jaquette,* short coat], a coatlike garment of canvas with long sleeves that can be tied behind the wearer's back to prevent arm movement. It is used for restraining violent or uncontrollable people. Also called **camisole restraint.**

strangle /strang′gəl/ [L, *strangulare,* to choke], to cause an interruption of breathing by compressing or constricting the trachea. Also called *strangulate.* **—strangulated,** *adj.*

strangulated /strang′gyəlā′tid/ [L, *strangulare,* to choke], pertaining to a constriction or compression of the trachea or other upper airway structure that interrupts the normal flow of air.

strangulated hemorrhoid [L, *strangulare,* to choke; Gk, *haimorrhoise,* vein that discharges blood], a prolapsed hemorrhoid that has become trapped by the anal sphincter, causing the blood supply to become occluded by the sphincter's constricting action.

strangulated hernia [L, *strangulare,* to choke, *hernia,* rupture], a hernia in which the blood vessels have become constricted by the neck of the hernial sac, resulting in ischemia and possible gangrene if blood circulation is not quickly restored.

strangulation /strang′gyəlā′shən/ [L, *strangulare,* to choke], the constriction of a tubular structure of the body, such as the trachea, a segment of bowel, or the blood vessels of a limb, that prevents function or impedes circulation. See also **intestinal strangulation.**

strap [AS, *stropp*], **1.** *n,* a band, such as that made of adhesive plaster, that is used to hold dressings in place or to attach one thing to another. **2.** *v,* to bind securely.

strapping, the application of overlapping strips of adhesive tape to an extremity or body area to exert pressure and hold a structure in place, performed in the treatment of strains, sprains, dislocations, and certain fractures.

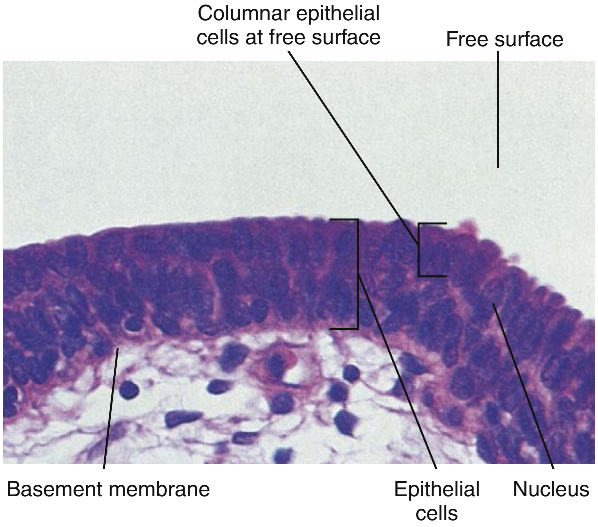
strata. See **stratum.**

strati-, prefix meaning "layer": *stratification, stratiform, stratigraphy.*

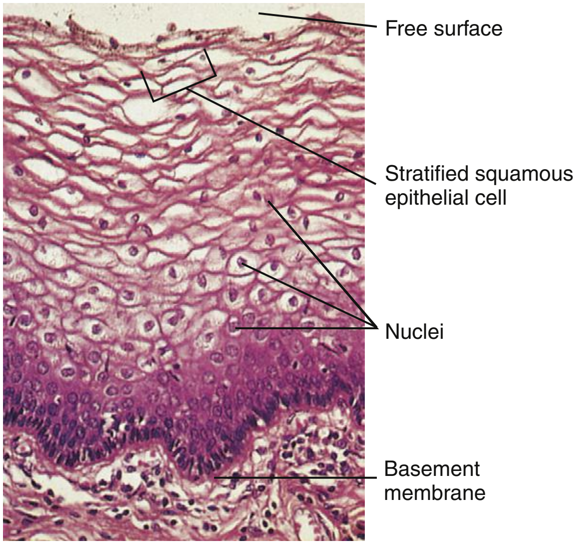
stratified /strat′ifīd/ [L, *stratum* + *facere,* to make], arranged in layers.

stratified clot, a semisolid mass of coagulated blood that forms in layers within an aneurysm.

stratified epithelium [L, *stratum* + *facere;* Gk, *epi,* above, *thele,* nipple], closely packed sheets of epithelial cells arranged in layers over the external surface of the body and lining most of the hollow structures. The layers may include stratified squamous, stratified columnar, or stratified columnar ciliated types of cells. There are various subtypes of stratified epithelium, named for the type of cells on the surface (e.g., stratified squamous epithelium, stratified columnar epithelium).



Stratified columnar epithelium
(© Ed Reschke; used with permission)



Stratified squamous epithelium
(© Ed Reschke; used with permission)

stratified sample. See **sample.**

stratiform cartilage. See **fibrocartilage.**

stratiform fibrocartilage /strat′ifôrm/ [L, *stratum,* layer, *forma,* form, *fibra,* fiber, *cartilago,* cartilage], a structure made of fibrocartilage that forms a thin coating of osseous grooves through which tendons of certain muscles glide. Small masses of stratified fibrocartilage also develop in the tendons of some muscles that glide over bones, as in the tendons of the peroneus longus and the tibialis posterior. Compare **circumferential fibrocartilage, connecting fibrocartilage, interarticular fibrocartilage.**

stratum /strā′təm, strat′əm/ *pl.* **strata** [L, layer], a uniformly thick sheet or layer, usually associated with other layers, such as the stratum basale of the epidermis.

stratum basale, **1.** also called **basal layer, stratum germinativum.** The deepest of the five layers of the epidermis, composed of cuboidal-shaped cells. This layer provides new cells by mitotic cell division. Compare **stratum corneum, stratum granulosum, stratum lucidum, stratum spinosum.** See also **skin. 2.** the deepest layers of the uterine decidua, containing uterine gland terminals.

stratum corneum, the horny, outermost layer of the skin, composed of dead flat cells converted to keratin that continually flakes away. The thickness of the layer is correlated with the normal wear of the area it covers. The stratum corneum is thick on the palms of the hands and the soles of the feet but relatively thin over most areas. Also called **horny layer.** Compare **stratum basale, stratum granulosum, stratum lucidum, stratum spinosum.** See also **skin.**

stratum germinativum. See **stratum basale.**

stratum granulosum, one of the layers of the epidermis, situated just below the stratum corneum except in the thick skin of the palms of the hands and the soles of the feet, where it lies just under the stratum lucidum. The stratum granulosum contains visible granules in the cytoplasm of its cells, which die, become keratinized, move to the surface, and flake away. Compare **stratum basale, stratum corneum, stratum lucidum, stratum spinosum.** See also **skin.**

stratum lucidum, one of the layers of the epidermis, situated just beneath the stratum corneum and present only in the thick skin of the palms of the hands and the soles of the feet. It contains translucent eleidin that forms keratin. Also called **clear cell layer.** Compare **stratum basale, stratum corneum, stratum granulosum, stratum spinosum.** See also **skin.**

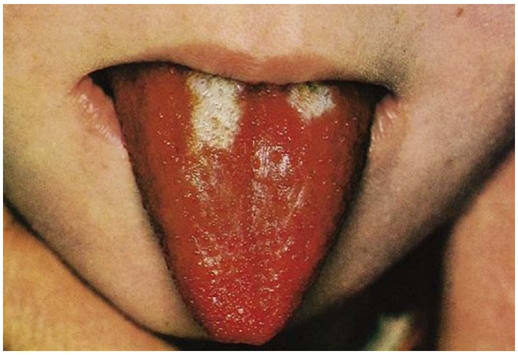
stratum spinosum, one of the layers of the epidermis, composed of several layers of polygonal cells. It lies on top of the stratum basale and beneath the stratum granulosum and contains tiny fibrils within its cellular cytoplasm. When the cells of the stratum spinosum are pulled apart, they present minute spines, called desmosomes, at their surfaces. Also called **prickle cell.** Compare **stratum basale, stratum corneum, stratum granulosum, stratum lucidum.** See also **skin.**

stratum spongiosum, one of the three layers of the endometrium of the uterus, containing tortuous, dilated uterine glands and a small amount of interglandular tissue. With the stratum compactum it forms the functional part of the endometrium during pregnancy. Compare **stratum basale.** See also **decidua, placenta.**

strawberry gallbladder /strô′berē/ [AS, *streawberig* + ME, *gal,* gall; AS, *blaedre*], a tiny yellow gallbladder spotted with deposits on the red mucous membrane, characteristic of cholesterolosis.

strawberry hemangioma, strawberry mark. See **capillary hemangioma.**

strawberry tongue, a strawberry-like coloration of the inflamed tongue papillae. It is a clinical sign of scarlet fever and is also seen in Kawasaki's disease.



Strawberry tongue *(Emond, Wellsby, and Rowland, 2003)*

stray light [OFr, *estraier,* to wander; AS, *leoht,* illumination], radiant energy that reaches a photodetector and that consists of wavelengths other than those defined by the filter or monochromator.

stray radiation. See **leakage radiation.**

streak [AS, *strican,* to stroke], a line or a stripe, such as the primitive streak at the caudal end of the embryonic disk.

street virus, a natural infectious agent, such as rabies, that may be transmitted from a domestic animal or may be acquired in the wild, outside the laboratory.

strength [AS, *strengou*], the ability of a muscle or a person to produce or resist a physical force.

strength of association, the degree of relationship between a causal factor and the occurrence of a disease, usually expressed in terms of a relative risk ratio.

strength training, a method of improving muscular strength by gradually increasing the ability to resist force through the use of free weights, machines, or the person's own body weight. Strength training sessions are designed to impose increasingly greater resistance, which in turn stimulates development of muscle strength to meet the added demand.

strepho-, streph-, prefix meaning "twisted": *strephopodia, strephosymbolia, strephotome.*

streptavidin /strep′təvī′din/, a biotin-binding protein isolated from *Streptomyces* and used to identify antigens; a widely used reagent for immunoassays.

strep throat [*Streptococcus* + AS, *throte*], *(informal)* an infection of the oral pharynx and tonsils caused by a hemolytic species of *Streptococcus,* usually belonging to group A. The infection is characterized by sore throat, chills, fever, swollen lymph nodes in the neck, and sometimes nausea and vomiting. The symptoms usually begin abruptly a few days after exposure to the organism in airborne droplets or after direct contact with an infected person. Also called **streptococcal sore throat.**

■ OBSERVATIONS: The throat is diffusely red, and the tonsils often are covered with a yellow or white exudate. Diagnosis is confirmed by bacteriological culture and identification of the streptococcal bacteria in a specimen taken from the throat. Complications of strep throat are otitis media, scarlet fever, and sinusitis; other complications include acute glomerulonephritis and acute rheumatic fever.

■ INTERVENTIONS: Treatment usually includes intramuscular injection of penicillin G benzathine or the administration of penicillin for 10 days. Erythromycin may be given to people allergic to penicillin. For recurrent infections, tonsillectomy may be recommended.

strepticemia. See **streptococcemia.**

strepto-, prefix meaning "twisted": *streptobacilli, streptococcal, streptomicrodactyly.*

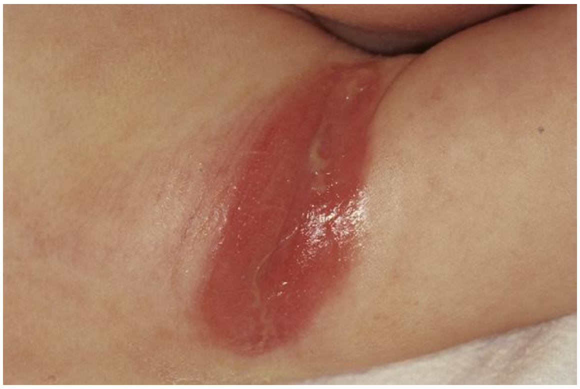
streptobacillary rat-bite fever. See **Haverhill fever.**

Streptobacillus moniliformis [Gk, *streptos,* curved; L, *bacillum,* small rod, *monile,* necklace, *forma,* form], a species of necklace-shaped nonmotile gram-negative bacteria that can cause rat-bite fever in humans.

streptococcal. See ***Streptococcus.***

streptococcal angina [Gk, *streptos* + *kokkos,* berry; L, *angina,* quinsy], a condition in which feelings of choking, suffocation, and pain result from a streptococcal infection.

streptococcal infection, an infection caused by pathogenic bacteria of one of several species of the genus *Streptococcus* or their toxins. Almost any organ of the body may be involved. The infections occur in many forms, including cellulitis, endocarditis, erysipelas, impetigo, meningitis, pneumonia, scarlet fever, tonsillitis, and urinary tract infection. See also **strep throat.**



Streptococcal infection resulting in red, oozing skin
(Weston, Lane, and Morelli, 2007)

streptococcal sore throat. See **strep throat.**

streptococcemia /-koksē′mē·ə/ [Gk, *streptos,* curved, *kokkos,* berry], a condition of the presence of streptococci bacteria in the blood. Also called **strepticemia,** *streptococci,* **streptosepticemia.**

streptococcus beta-hemolytic, Group A, a strain of streptococcus, group A in the Lancefield classification, that causes necrotizing fasciitis toxic shock syndrome.

streptococcus beta-hemolytic, Group B, a strain of streptococcus that causes human infections such as neonatal sepsis, endocarditis, and septic arthritis.

Streptococcus pneumoniae [Gk, *streptos,* curved, *kokkos,* berry, *pneumon,* lung], any of 70 antigenic types of pneumococcal bacteria that cause pneumonia and other diseases in humans. Bacteria are most commonly community acquired, but there are immunizations for 23 strains.

Streptococcus pyogenes [Gk, *streptos,* curved, *kokkos,* berry, *pyon,* pus, *genein,* to produce], a species of streptococcus with many strains that are pathogenic to humans, including the beta-hemolytics in Lancefield group A. It causes suppurative diseases, such as scarlet fever and strep throat.

***Streptococcus* (Str.)** /strep′təkok′əs/ [Gk, *streptos* + *kokkos,* berry], a genus of nonmotile gram-positive cocci classified by serological types (Lancefield groups A through T), by hemolytic action (α, β, γ) when grown on blood agar, and by reaction to bacterial viruses (phage types 1 to 86). The various species occur in pairs, short chains, and chains. Some are facultative aerobes, and some are anaerobic. Some species also are hemolytic, and others are nonhemolytic. Many species cause disease in humans. *Streptococcus faecalis,* a penicillin-resistant group D enterococcus and normal inhabitant of the GI tract, may cause infection of the urinary tract or endocardium. *S. pneumoniae* (formerly *Diplococcus pneumoniae*) causes a majority of the cases of bacterial pneumonia in the United States. *S. pyogenes* belongs to group A and may cause tonsillitis and respiratory, urinary, or skin infections. Some beta-hemolytic strains may lead to rheumatic fever or to glomerulonephritis. *S. viridans,* a member of the normal flora of the mouth, is the most common cause of bacterial endocarditis, especially when introduced into the bloodstream during dental procedures.—**streptococcal,** *adj.*

Streptococcus viridans [Gk, *streptos,* curved, *kokkos,* berry], a poorly defined species of ***Streptococcus*** similar to *S. pyogenes* strains. It produces alpha-hemolysis in cultures and is a common cause of subacute bacterial endocarditis and other infections, such as gingivitis, in humans.

streptokinase (sk) /strep′təkī′nās/ [Gk, *streptos* + *kinesis,* motion, (ase) enzyme], a fibrinolytic activator that enhances the conversion of plasminogen to the fibrinolytic enzyme plasmin. It is produced by strains of streptococci. It is used in the treatment of certain cases of pulmonary and coronary embolism.

streptokinase-streptodornase /-strep′tōdôr′nās/, two enzymes derived from a strain of *Streptococcus hemolyticus*.

■ INDICATIONS: It is prescribed for debridement of purulent exudates, clotted blood, radiation necrosis, or fibrinous deposits resulting from trauma or infection.

■ CONTRAINDICATIONS: Active hemorrhage, acute cellulitis, or danger of reopening bronchopleural fistulas prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are pyrogenic reactions and irritation.

streptolysin /streptol′isis/ [Gk, *streptos* + *lysein,* to loosen], a filterable substance, produced by streptococci, that liberates hemoglobin from red blood cells.

streptomycin sulfate /strep′təmī′sin/, an aminoglycoside antibiotic.

■ INDICATIONS: It is prescribed in the treatment of tuberculosis, endocarditis, and certain other infections.

■ CONTRAINDICATIONS: Pregnancy or hypersensitivity to this drug prohibits its use. It must be used with caution in individuals who have vertigo, tinnitus, other manifestations of labyrinthine disease, or impaired renal function and in the elderly.

■ ADVERSE EFFECTS: Among the most serious adverse effects are ototoxicity (generally irreversible), nephrotoxicity (generally reversible), muscle weakness, and allergic reactions.

streptosepticemia. See **streptococcemia.**

streptozocin /strep′təzō′sin/, an antineoplastic used in the treatment of neoplasms, including metastatic islet cell tumors of the pancreas. It is an antibiotic substance from *Streptomyces acromogenes*.

stress [OFr, *estrecier,* to tighten], any emotional, physical, social, economic, or other factor that requires a response or change. Examples include dehydration, which can cause an increase in body temperature, and a separation from parents, which can cause a young child to cry. Stress can be positive or negative. Ongoing chronic stress can result in physical illness. Stress has been theorized as a major contributing factor in many physical diseases, such as asthma. Stress may also be applied therapeutically to promote change, such as implosive therapy for phobic patients, in which the patient is given support while being exposed to the situation that produces anxiety and is thereby gradually desensitized. The nature and degree of stress observed in a patient are frequently evaluated by the nurse as part of the ongoing holistic nursing assessment. See also **general adaptation syndrome.**

stress-adaptation theory, a concept that stress depletes the reserve capacity of individuals, thereby increasing their vulnerability to health problems.

stress amenorrhea [OFr, *estrecier,* Gk, *a* + *men,* month, *rhoia,* to flow], a cessation in menstruation caused by a physical change or mental stress.

stress-bearing area, the portion of the natural oral structures that is available to support a denture. Also called **basal seat area, denture-bearing area.**

stress behavior, a change from a person's normal behavior in response to a stressor.

stress echocardiography, echocardiography done while the patient is under stress, such as during exercise.

stress fracture, a fracture, often in one or more of the metatarsal bones, caused by repeated, prolonged, or abnormal stress.

stress incontinence. See **incontinence.**

stress inoculation, a procedure useful in helping patients control anxiety by substituting positive coping statements for statements that bring about anxiety.

stress kinesic, a type of behavioral characteristic of personal conversation, such as the use of body shifts or movements, that marks the flow of speech and generally coincides with linguistic stress patterns.

stress level, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of manifested physical or mental tension resulting from factors that alter an existing equilibrium. See also **Nursing Outcomes Classification.**

stress management, methods of controlling factors that require a response or change within a person by identifying the stressors, eliminating negative stressors, and developing effective coping mechanisms to counteract the response constructively. Examples include progressive muscular relaxation, guided imagery, biofeedback, breathing techniques, and active problem solving.

stressor /stres′ər/ [OFr, *estrecier,* to tighten], anything that causes wear and tear on the body's physical or mental resources. See also **general adaptation syndrome.**

stress radiography, the radiographic examination of a body area for soft tissue tears or ruptures. The lesions may appear as abnormal gaps between joint surfaces.

stress reaction, an acute maladaptive emotional response to an actual or perceived stressor.

stress response syndrome. See **posttraumatic stress disorder.**

stress test, a test that measures the function of a system of the body when subjected to carefully controlled amounts of physiological stress, usually exercise but sometimes specific drugs. The data produced allow the examiner to evaluate the condition of the system being tested. Cardiopulmonary function, respiratory function, and intrauterine fetal placental function are tested with stress tests. Also called **thallium stress test, treadmill stress test.** See also **exercise electrocardiogram, oxytocin challenge test.**

stress theory of aging, a stochastic theory of aging that hypothesizes that aging and death result from the effects of environmental stressors that cause wear and tear on cells and disrupt their function. The generation of free radicals during oxidative cell processes is sometimes cited as a specific stressor that disrupts DNA and protein function and so causes aging. See also **theories of aging.**

stress ulcer, a gastric or duodenal ulcer that develops in previously unaffected individuals subjected to severe stress, such as a severe burn. See also **Curling's ulcer.**

stretching of contractures [AS, *streccan* + L, *contractura,* drawing together], any of several procedures for release of muscle and other structures that have been shortened because of paralysis, spasm, disuse, or fibrosis. The procedures include stretching exercises, tissue grafts, scar tissue removal, tendon transfer, and incision of a joint capsule.

stretch mark. See **stria.**

stretch pressure, a rehabilitation technique in which the thumb, fingertips, or palm of the hand is used to stretch a target muscle, followed by briefly maintained pressure.

stretch receptor [AS, *streccan* + L, *recipere,* to receive], specialized sensory nerve endings in muscle spindles or tendons that are stimulated by stretching movements.

stretch reflex [AS, *streccan* + L, *reflectere,* to bend back], a reflex muscle contraction after it is stretched as a result of stimulation of proprioceptors in the muscle. Tendon reflexes function in a similar manner. Also called **myostatic reflex.**

stretch release, a rehabilitation technique in which the fingertips are placed over the belly of a large muscle and then spread apart in an effort to stretch the skin and underlying muscle. The stretch is done firmly enough to deform the soft tissue temporarily, stimulating cutaneous and muscle efferents and producing facilitation of the underlying muscle.

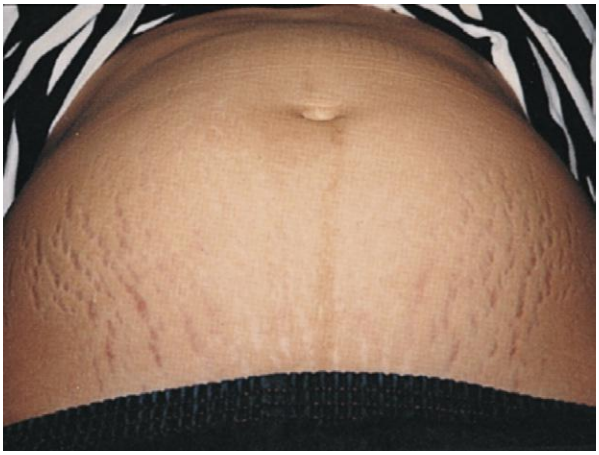
stri-, prefix meaning "line, stripe, or streak": *striation, striocellular, striomuscular.*

stria /strī′ə/ *pl.* **striae** [L, furrow], a streak or a linear scar that often results from rapidly developing tension in the skin, such as seen on the abdomen after pregnancy. Purplish striae are among the classic findings in hyperadrenocorticism. Also called **stretch mark.**

stria atrophica. See **linea alba.**

striae. See **stria.**

stria gravidarum, irregular depressions with red to purple coloration that appear in the skin of the abdomen, thighs, and buttocks of pregnant women.



Stria gravidarum

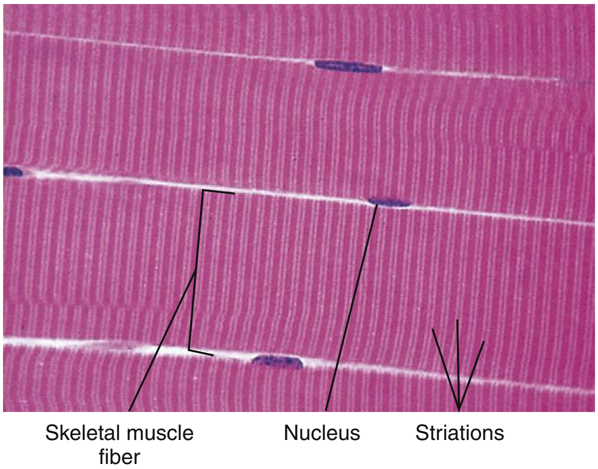
(Lowdermilk, Perry, and Bobak, 2004/Courtesy Michael S. Clement)

striatal /strī·ā′təl, strī′ətəl/ [L, *striatus,* striped], pertaining to the corpus striatum.

striatal toe, hyperextension of the great toe.

striated /strī′āted/ [L, *striatus,* striped], identifying something that is striped, is marked by parallel lines, or has structural lines.

striated muscle /strī′ātid/ [L, *striatus,* striped, *musculus,* muscle], any muscle, including all of the **skeletal muscles,** in which the fibers are divided by bands of cross-striations (stripes) as a result of overlapping of thick and thin myofilaments. Contractions in such muscles are voluntary. The heart, a striated involuntary muscle, is an exception. Cardiac muscle is often placed in its own category because it has microanatomical and contraction physiological characteristics very different from those of most striated muscle. Also called **skeletal muscle, voluntary muscle.** Compare **cardiac muscle, smooth muscle.**



Striated muscle *(© Ed Reschke; used with permission)*

stria terminalis, a slender, compact fiber bundle that functions as a limbic pathway running from the amygdaloid complex to the hypothalamus and septum.

stricture /strik′chər/ [L, *stringere,* to tighten], an abnormal temporary or permanent narrowing of the lumen of a hollow organ, such as the esophagus, pylorus of the stomach, ureter, or urethra. It is caused by inflammation, external pressure, or scarring. Treatment varies depending on the cause. Compare **spasm.**

strict vegetarian [L, *stringere* + *vegetare,* to grow, *arius,* believer], a vegetarian who consumes no animal products, including meat, fish, poultry, dairy foods, or eggs. All foods consumed are plant-based, including fruits, vegetables, legumes, nuts, seeds, grain, and soy foods. Such diets, unless adequately planned, may be inadequate in many essential nutrients, particularly vitamin B_{12}. Also called **vegan.**

stridor /strī′dôr/ [L, harsh sound], an abnormal high-pitched musical sound caused by an obstruction in the trachea or larynx. It is usually heard during inspiration. Stridor may indicate several neoplastic or inflammatory conditions, including glottic edema, asthma, diphtheria, laryngospasm, and papilloma.

strike [AS, *strican,* to advance swiftly], an action taken collectively by the employees of a company or institution in which they stop reporting for work in an effort to cause the employer to accede to certain demands. A strike usually follows unsuccessful negotiations between representatives of the union and management.

string, a cord, usually made of fiber, configured in a long thin line.

string carcinoma [AS, *strenge,* cord; Gk, *karkinos,* cancer, *oma,* tumor], a malignancy of the large intestine, usually the ascending or transverse colon. On radiological visualization, it causes the intestine to appear to be tied in segments like a string of large beads.

stringiness /string′inəs/, an abnormal tissue texture caused by fine or stringlike myofascial structures.

string sign, a narrow pyloric canal with congenital pyloric stenosis or a narrowed bowel segment with regional ileitis. Use of a radiopaque contrast medium causes the narrowed lumen to appear as a thin string on radiographs.

striocerebellar tremor /strī′ōser′əbel′ər/, a combination of static, active, and intentional voluntary muscle contractions with both striatal and cerebellar components. It is associated with hereditary ataxia and diffuse degeneration of the central nervous system.

strip membranes [Ger, *strippe,* strap; L, *membrana,* thin skin], (in obstetrics) a procedure in which an examiner, with the fingers, frees the membranes of the amniotic sac from the wall of the lower segment of the uterus in the small area around the cervical os. It is done to stimulate labor, but, because infection or hemorrhage may result, it is not recommended.

stripping, **1.** nontechnical. a surgical procedure for the removal of the long and short saphenous veins of the legs. See also **milking, varicose vein. 2.** the mechanical removal of a very small amount of enamel from the mesial or distal surfaces of teeth to alleviate crowding.

stroke. See **cerebrovascular accident.**

stroke prone profile [AS, *strac*], a predictive index using a complex of risk factors that indicate susceptibility of a person to cerebrovascular accident (CVA). The factors include advanced age, hypertension, a history of transient ischemic attacks, cigarette smoking, heart disorders, associated embolism, family history of CVA, use of oral contraceptives, diabetes mellitus, physical inactivity, obesity, hypercholesteremia, and hyperlipidemia.

stroke volume, the amount of blood ejected by a ventricle during contraction.

stroke volume index, stroke volume divided by the body surface area.

stroking /strō′king/, running the entire hand over large parts of the body to relax the muscles reflexively and eliminate muscle spasm, improve circulation, or produce a parasympathetic response. See also **effleurage.**

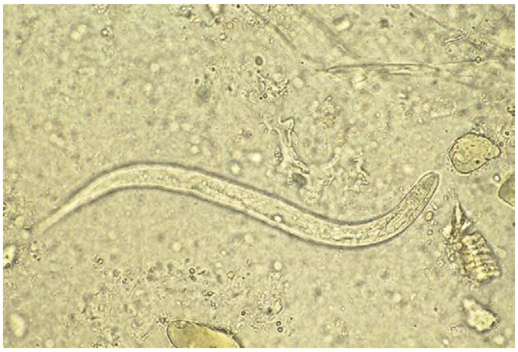
stroma /strō′mə/ *pl.* **stromas, stromata** [Gk, covering], the supporting tissue or the matrix of an organ, as distinguished from its parenchyma. Some kinds of stromata are the vitreous stroma, which encloses the vitreous humor of the eye, and Rollet's stroma, which contains the hemoglobin of a red blood cell. **—stromatic,** *adj.*

stroma-, prefix meaning "connective tissue forming framelike support for an organ": *stromatin, stromatogenous, stromatosis.*

-stroma, suffix meaning "supporting tissue of an organ": *blastostroma, mesostroma, myostroma.*

stromas, stromata, stromatic. See **stroma.**

Strongyloides /stron′jiloi′dēz/ [Gk, *strongylos,* round, *eidos,* form], a genus of parasitic intestinal nematode. One species, *S. stercoralis,* causes strongyloidiasis, a potentially life-threatening infection under certain circumstances.



***Strongyloides stercoralis* larvae**

(Murray, Rosenthal, and Pfaller, 2005)

strongyloidiasis /stron′jəloidī′əsis/, infection of the small intestine by the roundworm *Strongyloides stercoralis*. It is acquired when larvae from the soil penetrate intact skin, incidentally causing a pruritic rash. The larvae pass to the lungs via the bloodstream, sometimes causing pneumonia. They then migrate up the air passages to the pharynx, are swallowed, and develop into adult worms in the small intestine. Bloody diarrhea and intestinal malabsorption may result. Rarely, fatal disseminated strongyloidiasis occurs. Diagnosis depends on finding larvae in freshly passed feces. Treatment of established infections often includes administration of thiabendazole, ivermectin, and albendazole. Early infection is treated with inhaled beta-agonists. Antihelminthic therapy works poorly against the larval stage. Proper sanitary methods for the disposal of excrement can eliminate the disease. Wearing shoes prevents contagion from contaminated soil. Hyperinfection syndrome can arise in immunocompromised patients. Also called **threadworm infection.** See also **Löffler's syndrome.**

strontium (Sr) /stron′sh(ē)əm/ [Strontian, Scotland], a metallic element. Its atomic number is 38; its atomic mass is 87.62. Chemically similar to calcium, it is found in bone tissue. Isotopes of strontium are used in radioisotope scanning procedures of bone. Strontium 85 (^{85}Sr) and strontium 87 (^{87}Sr) mimic calcium metabolism and are used in studies of bone physiological characteristics and disorders. These radionuclides can be counted with any standard detector or imaged at a very early stage in bone disease, whereas radiographic films of bone without the use of a radioactive tracer can show decreased density only after approximately 50% of bone is decalcified. Most ^{85}Sr or ^{87}Sr is deposited in bone within 1 hour after injection. Increased deposition of these radionuclides is strongly linked to osteoblastic activity and new bone formation. In addition to four naturally occurring isotopes (^{88}Sr, ^{87}Sr, ^{86}Sr, and ^{84}Sr), 12 artificial strontium isotopes are produced by nuclear reactions. Strontium 90, the longest-lived, is the most dangerous constituent of fallout from atomic bomb tests. It can replace some of the calcium in food, become concentrated in teeth and bones, and continue to emit electrons that can cause death in the host. Strontium 90 becomes concentrated in cow's milk.

Stroop test [John Ridley Stroop PhD., 1897–1973], a test of cognitive ability assessing the ability to direct attention to a task.

-strophe, strophy, suffix meaning "turning or twisting": *cardianastrophe, enstrophe, phallanastrophe.*

stropho-, prefix meaning "twisted": *strophocephalus, strophosomus.*

strophulus. See **papular urticaria.**

-strophy. See **-strophe.**

structural /struk′chərəl/ [L, *structura,* arrangement], pertaining to the arrangement or pattern of component parts of an object or organism.

structural chemistry [L, *structura,* arrangement], the science dealing with the molecular structure of chemical substances.

structural gene, a gene that specifies the amino acid sequence of a polypeptide.

structural integration, a technique of deep massage intended to help in the realignment of the body by altering the length and tone of myofascial tissues. The basis of the practice is the belief that misalignment of myofascial tissues, a result of improper posture and emotional and physical traumas, may have a detrimental effect on a person's energy level, self-image, muscular efficiency, perceptions, and general health. Also called **Rolfing.**

structural model, a model of family therapy that views the family as an open system and identifies subsystems within the family that carry out specific family functions. When faced with demands for change, individual family members, family subsystems, or the family as a whole may respond with growth behaviors or maladaptive behaviors. The goal of family therapy is to help family members learn new scripts or transactional patterns.

structure /struk′chər/ [L, *structura*], a part of the body, such as the heart, a bone, a gland, a cell, or a limb.

structure-activity relationship (SAR), the relationship between the chemical structure of a drug and its activity.

structured learning therapy /struk′chərd/, a rehabilitation technique used with schizophrenic patients.

strum-, prefix meaning "a goiter or scrofula": *strumectomy, strumiform, strumitis.*

struma lymphomatosa. See **Hashimoto's disease.**

Strümpell-Marie disease /strim′pəl märē′/ [Ernst A. von Strümpell, German neurologist, 1853–1925; Pierre Marie, French neurologist, 1853–1940; L, *dis* Fr, *aise,* ease], ankylosing spondylitis. Also called **Marie-Strümpell arthritis, rheumatoid spondylitis, spondylitis ankylopoietica.**

strychnine /strik′nin, strik′nīn/ [Gr, *strychnos,* nightshade], a white crystalline alkaloid obtained from the leaves of the *Strychnos nux-vomica* plant. It is extremely toxic to the central nervous system, producing as a classic strychnine poisoning symptom an arched back (opisthotonus).

strychnine poisoning [Gk, *strychnos* + L, *potio,* a drink], toxic effects of ingesting strychnine, a central nervous system stimulant. Symptoms include restlessness and hyperacuity of hearing and vision. Minor stimuli may produce convulsions, but there may be complete muscle relaxation between convulsions. One classic sign of strychnine poisoning is an arched back (opisthotonus).

Stryker wedge frame, a trademark for an orthopedic bed that allows the patient to be rotated as required to either the full supine or the full prone position. It is used in the immobilization of patients with unstable spines, postoperative management of multilevel spinal fusions, and management of severe burn patients. Compare **CircOlectric bed, Foster bed, hyperextension bed.**

STS, abbreviation for **sit-to-stand.**

S-T segment, an isoelectric line after the QRS complex on the electrocardiogram. It represents phase 2 of the cardiac action potential. Elevation or depression of the S-T segment is the hallmark of myocardial ischemia or injury and coronary artery disease.

Stuartnatal Plus, a trademark for a fixed-combination oral prenatal drug containing vitamins and minerals.

Stuart-Prower factor. See **factor X.**

student health status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the physical, cognitive, emotional, and social status of a school-age child. See also **Nursing Outcomes Classification.**

Studer neobladder, a low pressure type of orthotopic ileal neobladder with ureters attached to the proximal "chimney" of the neobladder.

stump [ME, *stumpe*], the part of a limb that remains after amputation. Also called **residual limb.**

stump hallucination, the sensation of the continued presence of an amputated limb. See also **hallucination, phantom limb syndrome.**

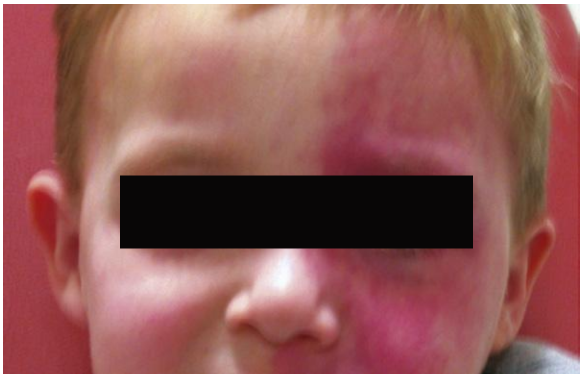
stump pain, pain arising in the stump in a person with an amputated limb. Unlike phantom limb pain, which originates and ends in the brain, it originates from damaged nerves near the site of the amputation.

stunned myocardium, a condition of impaired myocardial contractile function, cellular biochemical characteristics, and microvasculature function in the absence of gross myocardial necrosis. It can last for minutes to days and is caused by ischemia that is either brief or occurs in the area immediately outside an infarct zone.

stupefacient /st(y)o͞o′pəfā′shənt/ [L, *stupere,* to stun, *facere,* to make], an opioid or other agent that has the effect of making a person stuporous.

stupor /st(y)o͞o′pər/ [L, *stupere,* to stun], a state of unresponsiveness in which a person seems unaware of the surroundings. The condition occurs in neurological and psychiatric disorders. The person may be totally or almost totally immobile and unresponsive, even to painful stimuli. Kinds of stupor are **anergic stupor, benign stupor,** and **epileptic stupor.** —*stuperas, adj.*

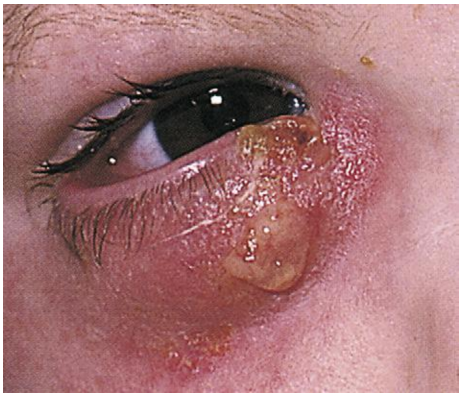
Sturge-Weber syndrome /sturj′ web′ər/ [William A. Sturge, English physician, 1850–1919; Frederick P. Weber, English physician, 1863–1962], a congenital neurocutaneous disease marked by a port-wine–colored capillary hemangioma over a sensory dermatome of a branch of the trigeminal nerve of the face. Radiographic examination of the skull reveals intracranial calcification. The cerebral cortex may atrophy, and generalized or focal seizures, angioma of the choroid, secondary glaucoma, optic atrophy, and new cutaneous hemangiomas may develop. There is no known cure. Treatment is supportive and includes anticonvulsive medication. Also called **encephalotrigeminal angiomatosis.**



Sturge-Weber syndrome

(Albert et al, 2008)

stuttering [D, *stotteren*], a speech disorder usually characterized by excessive abnormal hesitations, blocks, part-word and whole-word repetitions, and audible or silent prolongation of sounds. The cause of stuttering is unknown; it may be hereditary or may result from developmental processes or neurological impairment. Hesitancy and lack of fluency in speech are typical characteristics of normal speech and language development during the preschool years, when a child's physical, psychological, and speech and language development do not match the linguistic demands of talking. The child may become conscious of speaking difficulties associated with acquisition, and a fear of speaking may develop. Early prevention and evaluation are recommended. The health care professional may educate parents by making them aware of the normal dysfluent patterns in a child's speech and by suggesting ways to encourage a child's speech development. If stuttering persists, parents should be encouraged to seek the advice of a speech-language pathologist. Also called **fluency disorder.** See also **stammering.**



Sty *(Kanski and Nischal, 1999)*

sty [ME, *styanye,* eyelid tumor], a purulent infection of a meibomian or sebaceous gland of the eyelid, often caused by a staphylococcal organism. Also spelled **stye.** Also called **hordeolum.**

-style, suffix meaning a "bone attached to an internal structure": *cephalostyle, sarcostyle, zygostyle.*

stylet /stī′lət, stīlet′/ [It, *stiletto,* dagger], a thin metal probe for inserting into or passing through a needle, tube, or catheter to clean the hollow bore or for inserting into a soft, flexible catheter to make it stiff as the catheter is placed in a vein or passed through an orifice of the body. Also spelled **stilet, stilette.**

stylo-, prefix meaning "like a pillar, stake, or pole": *stylomastoid, stylomyloid, stylostixis, styloid.*

styloglossus, a muscle that retracts the tongue and pulls the back of the tongue superiorly. It is innervated by the hypoglossal nerves.

stylohyoideus /stī′lōhī·oi′dē·əs/ [Gk, *stylos,* pillar, *hyoeides,* U-shaped], one of four suprahyoid muscles, lying anterior and superior to the posterior belly of the digastricus. It is a slender muscle that arises from the styloid process and inserts into the hyoid bone. It serves to draw the hyoid bone up and back. Also called **stylohyoid bone.** Compare **digastricus, geniohyoideus, mylohyoideus.**

stylohyoid ligament /stī′lōhī′oid/, the ligament attached to the tip of the styloid process of the temporal bone and to the lesser cornu of the hyoid bone. It frequently contains a small cartilage in its center and is often partially ossified.

styloid /stī′loid/ [Gk, *stylos,* pillar, *eidos,* form], long and tapered, like a pen or stylus.

styloid process [Gk, *stylos* + *eidos* + L, *processus*], any of several projections of bone tissue, particularly a projection on the temporal bone.

stylomandibular ligament /stī′lōmandib′yələr/ [Gk, *stylos* + L, *mandere,* to chew, *ligare,* to bind], one of a pair of specialized bands of cervical fascia forming an accessory part of the temporomandibular joint. It extends from the styloid process of the temporal bone to the ramus of the mandible between the masseter and pterygoideus muscles and separates the parotid gland from the submandibular gland. Compare **sphenomandibular ligament.**

stylus /stī′ləs/, **1.** a fine probe. **2.** a wire inserted into a catheter to stiffen it. **3.** a device that imprints electric activity and wave patterns on electrocardiographic, electroencephalographic, or similar graphic recordings.

styptic /stip′tik/ [Gk, *styptikos,* astringent], **1.** *n,* a substance used as an astringent, often to control bleeding. A chemical styptic induces coagulation of blood. A cotton pledget used as a compress to control bleeding is a mechanical styptic. **2.** *adj,* acting as an astringent or agent to control bleeding.

subacromial /sub′əkrō′mē·əl/ [L, *sub,* beneath; Gk, *akron,* extremity, *omos,* shoulder], pertaining to the area below the acromion.

subacromial bursa [L, *sub,* under; Gk, *akron,* extremity, *omos,* shoulder, *byrsa,* wineskin], the bursa separating the acromion and deltoid muscle from the insertion of the supraspinatus muscle and the greater tubercle of the humerus.

subacute /-əkyo͞ot′/ [L, *sub* + *acutus,* sharp], **1.** less than acute. **2.** pertaining to a disease or other abnormal condition present in a person who appears to be clinically well. The condition may be identified or discovered by means of a laboratory test or radiological examination.

subacute bacterial endocarditis (SBE), a chronic bacterial infection of the valves of the heart. It is characterized by a slow, quiet onset with fever, heart murmur, splenomegaly, and development of clumps of abnormal tissue, called vegetations, around an intracardiac prosthesis or on the cusps of a valve. Various species of *Streptococcus* or *Staphylococcus* are commonly the cause of SBE. Dental procedures are associated with infection by *Streptococcus viridans,* surgical procedures with *S. faecalis,* and self-infection (especially by drug abusers) with *Staphylococcus aureus.* See also **bacterial endocarditis, endocarditis, Janeway lesion.**

■ OBSERVATIONS: The infected vegetations may separate from the valve or prosthesis and form emboli. Osler's nodes, petechiae, Roth's spots, and splinter hemorrhages under the fingernails are common manifestations of blood-borne metastases of these emboli. Bacteriological examination of cultures of the blood may allow specific diagnosis and treatment.

■ INTERVENTIONS: Treatment requires prolonged and regular administration of an antibiotic that is known to be effective against the causative organism. If a prosthesis has become infected, it is usually removed. Before surgery or a dental procedure, prophylactic antibiotics are given. During the acute phase of illness the fever is treated with antipyretic medication and bed rest; adequate high-protein diet and fluids are encouraged.

■ NURSING CONSIDERATIONS: Bed rest and hospitalization may be necessary for several weeks. Emotional and psychological support may help the patient adjust to the necessary inactivity and to understand that SBE is a chronic illness.

subacute care, **1.** a level of treatment that is between chronic and acute. **2.** treatment of a disease that is of moderate severity or duration.

subacute combined degeneration of the spinal cord. See **combined system disease.**

subacute glomerulonephritis, an uncommon noninfectious disease of the glomerulus of the kidney characterized by proteinuria, hematuria, decreased production of urine, and edema. Of unknown cause, the disease may progress rapidly, and renal failure may occur. Kidney transplantation and dialysis are the only treatments available. See also **chronic glomerulonephritis, postinfectious glomerulonephritis, uremia.**

subacute infection [L, *sub,* beneath, *acutus,* sharp, *inficere,* to stain], a disease condition that is not chronic and that runs a rapid and severe, but less than acute, course.

subacute inflammation, a reactive sign of inflammation with a gradual onset, later increasing to a chronic or severe type of reaction.

subacute myelooptic neuropathy (SMON), a condition of muscular pain and weakness, usually below the T12 vertebra; painful dysesthesia of the limbs; and, in some cases, optic atrophy. The patient usually experiences a significant alteration of gait.

subacute necrotizing encephalomyelopathy, subacute necrotizing encephalopathy. See **Leigh disease.**

subacute necrotizing lymphadenitis. See **Kikuchi's lymphadenitis.**

subacute sclerosing panencephalitis, a rare progressive neurological disorder occurring with primary measles infection in children 2 years of age or younger, with a period of latency for 2 to 10 years. The condition occurs in children and in adolescents who have had measles at a very early age. It is characterized by diffuse inflammation of brain tissue, personality change, seizures, ataxia myoclonus, visual disturbances, dementia, fever, and death. Live measles virus can be cultured from brain tissue. No effective therapy is known; however, some antiviral drugs can slow the progression of the disease. A combination of oral Isoprinosine and interferon alfa injected into ventricles of the brain appears to be the most effective treatment. See also **slow virus.**

subacute spongiform encephalopathy. See **prion disease.**

subacute thyroiditis. See **de Quervain's thyroiditis.**

subaortic /-ā·ôr′tik/ [L, *sub* + Gk, *aerein*, to raise], pertaining to the area of the body below the aorta.

subaortic stenosis [L, *sub*, beneath; Gk, *aerein*, to raise, *stenos*, narrow, *osis*, condition], a narrowing of the left ventricle outflow tract below the aortic valve. Also called **aortic valvular stenosis.**

subapical /-ap′ikəl/, below the peak or apex.

subaponeurotic /-ap′ōno͞orot′ik/ [L, *sub*, beneath; Gk, *apo*, from, *neuron*, nerve; L, *tendo*], beneath an aponeurosis.

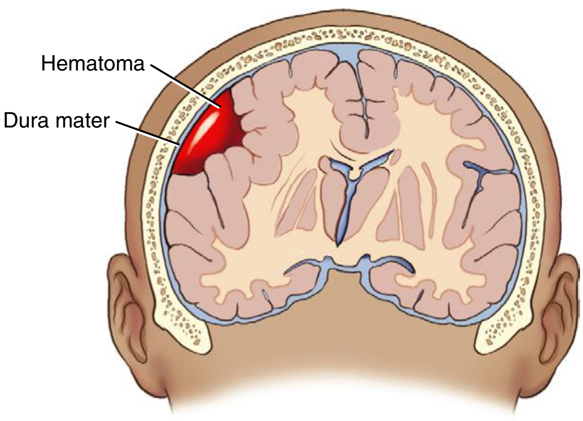
subarachnoid /sub′ərak′noid/ [L, *sub* + Gk, *arachne*, spider, *eidos*, form], pertaining to the area under the arachnoid membrane and above the pia mater.

subarachnoid block anesthesia. See **spinal anesthesia.**

subarachnoid cistern, any one of many small subarachnoid spaces that serve as reservoirs for cerebrospinal fluid.

subarachnoid hemorrhage (SaH, SAH), an intracranial hemorrhage into the cerebrospinal fluid-filled space between the arachnoid and pial membranes on the surface of the brain. The hemorrhage may extend into the brain if the force of the bleeding from the broken vessel is sudden and severe. The cause may be trauma, rupture of an aneurysm, or an arteriovenous anomaly.

■ OBSERVATIONS: The first symptom of a subarachnoid hemorrhage is a sudden, extremely severe headache that begins in one localized area and then spreads, becoming dull and throbbing. It is frequently described by patients as "the worst headache of my life." The localized pain results from vascular distortion and injury. The generalized ache is the result of meningeal irritation by blood in the subarachnoid space. Other characteristics of subarachnoid hemorrhage can include dizziness, rigidity of the neck, pupillary inequality, vomiting, seizures, drowsiness, sweating and chills, stupor, and loss of consciousness. A brief period of unconsciousness immediately after the rupture is common; severe hemorrhage may result in continued unconsciousness, coma, and death. Delirium and confusion often persist through the first weeks of recovery, and permanent brain damage is common.



Subarachnoid hemorrhage
(LaFleur Brooks and LaFleur Brooks, 2012)

subarachnoid hemorrhage precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as the reduction of internal and external stimuli or stressors to minimize the risk of rebleeding prior to surgery or an endovascular procedure to secure a ruptured aneurysm. See also **Nursing Interventions Classification.**

subarachnoid space, the space between the arachnoid membranes and pia mater membranes. It contains cerebrospinal fluid.

subatomic /-ətom′ik/ [L, *sub*, beneath; Gk, *atomos*, indivisible], pertaining to the particles and phenomena that are within an atom.

subaxillary /-ak′siler′ē/ [L, *sub*, beneath, *axilla*, wing], pertaining to the area beneath the axilla.

subcapital fracture /-kap′itəl/ [L, *sub* + *caput*, head], a fracture located just below the head of a bone that pivots in a ball-and-socket joint, such as the femur.

subcapsular /-kap′s(y)ələr/ [L, *sub*, beneath, *capsula*, little box], pertaining to the area below a capsule.

subcapsular cataract [L, *sub* + *capsula*, little box], a condition marked by opacity or cloudiness beneath the anterior or posterior capsule of the lens of the eye.

subcapsular hematoma, one in the subcapsular space of the kidney. It may be caused by a tumor, trauma, vasculitis, renal infarction, or other disease process.

subcapsular space, the potential space between the renal parenchyma and the renal capsules.

subclavian /səbklā′vē·ən/ [L, *sub* + *clavicula*, little key], situated under the clavicle, such as the subclavian vein.

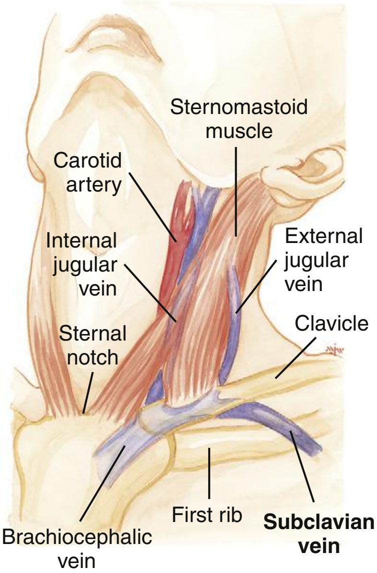
subclavian artery, one of a pair of arteries passing under the clavicle that vary in origin, course, and the height to which they rise in the neck but have six similar main branches supplying the vertebral column, spinal cord, ear, and brain. See also **left subclavian artery, right subclavian artery.**

subclavian catheter, a central venous catheter inserted through the subclavian vein.

subclavian steal syndrome, a vascular syndrome caused by an occlusion in the subclavian artery proximal to the origin of the vertebral artery. It results in a reversal of the normal blood pressure gradient in the vertebral artery and decreased blood flow distal to the occlusion. It is characterized by episodes of flaccid paralysis of the arm, pain in the mastoid and occipital areas, and a diminished or absent radial pulse on the involved side. Markedly different blood pressure measurements obtained from each arm are sometimes indicative of the condition.

subclavian trunk, one of the two lymphatic vessels, right and left, that drain the right upper limb and the superficial regions of the thoracic and upper abdominal wall.

subclavian vein, the continuation of the axillary vein in the upper body, extending from the lateral border of the first rib to the sternal end of the clavicle, where it joins the internal jugular to form the brachiocephalic vein. It usually contains a pair of valves near its junction with the internal jugular vein. The subclavian vein receives deoxygenated blood from the external jugular vein and, on the left side, at the junction



Subclavian vein *(Sanders et al, 2007)*

with the internal jugular vein, receives lymph from the thoracic duct. On the right side, at the corresponding junction, it receives lymph from the right lymphatic duct.

subclavius /səbklā′vē·əs/ [L, *sub* + *clavicula*], a short muscle of the chest wall. It is a small cylindric muscle between the clavicle and the first rib and arises in a short thick tendon from the junction of the first rib and its cartilage under the clavicle. It inserts into the groove on the inferior surface of the clavicle between the costoclavicular and conoid ligaments. The subclavius is innervated by a special nerve from the lateral trunk of the brachial plexus, which contains fibers from the fifth and sixth cervical nerves. It acts to draw the shoulder down and forward. Compare **pectoralis major, pectoralis minor, serratus anterior.**

subclinical /-klin′ikəl/ [L, *sub* + Gk, *kline,* bed], pertaining to a disease or abnormal condition so mild that it produces no symptoms.

subclinical deficiency, in orthomolecular medicine, deficiency of a nutrient sufficient to affect health but not severe enough to cause classic deficiency symptoms.

subclinical diabetes. See **impaired glucose tolerance.**

subcollateral gyrus /-kəlat′ərəl/ [L, *sub* + *con* + *lateralis* + Gk, *gyros,* turn], a convolution below the collateral fissure or sulcus of the cerebrum.

subconscious /-kon′shəs/ [L, *sub* + *conscire,* to be aware], a lay or popular term for unconscious, or partially conscious. **—subconsciousness,** *n.*

subconscious memory, a thought, sensation, or feeling that is not immediately available for recall to the conscious mind.

subconsciousness. See **subconscious.**

subcostales, muscles that span multiple ribs, extending from the internal surfaces of one rib to the internal surface of the second or third rib below. They are more numerous in the lower regions of the posterior thoracic wall. They parallel the course of the internal intercostal muscles and extend from the angle of the ribs to more medial positions on the ribs below.

subcostal nerve, the spinal nerve T12, which supplies skin and muscle of the abdominal wall.

subcrepitant rale, a fine moist rale heard over liquid in the smaller tubes. Also called **crackling rale.**

subcrestral periodontal pocket. See **periodontal pocket.**

subculture /sub′kulchər/ [L, *sub* + *colere,* to cultivate], an ethnic, regional, economic, or social group with characteristic patterns of behavior and ideals that distinguish it from the rest of a culture or society.

subcutaneous /sub′kyo͞otā′nē·əs/ [L, *sub* + *cutis,* skin], beneath the skin.

subcutaneous adipose tissue [L, *sub,* beneath, *cutis,* skin, *adeps,* fat; OFr, *tissu*], fat deposits beneath the skin.

subcutaneous chronic zygomycosis. See **entomophthoromycosis basidiobolae.**

subcutaneous emphysema, the presence of air or gas in the subcutaneous tissues. The air or gas may originate in the rupture of an airway or alveolus and migrate through the subpleural spaces to the mediastinum and neck. The face, neck, and chest may appear swollen. Skin tissues can be painful and may produce a crackling or popping sound as air moves under them. The patient may experience dyspnea and appear cyanotic if the air leak is severe. Treatment may require an incision to release the trapped air. Also called **aerodermectasia.**

subcutaneous fascia, a continuous layer of connective tissue over the entire body between the skin and the deep fascial investment of the specialized structures of the body, such as the muscles. It comprises an outer normally fatty layer and an inner thin elastic layer. Between the two layers lie superficial blood vessels, nerves, lymphatics, the mammary glands, most of the facial muscles, and the platysma. Also called **subcutaneous layer.** Compare **deep fascia, subserous fascia.**

subcutaneous fat necrosis. See **adiponecrosis subcutanea neonatorum.**

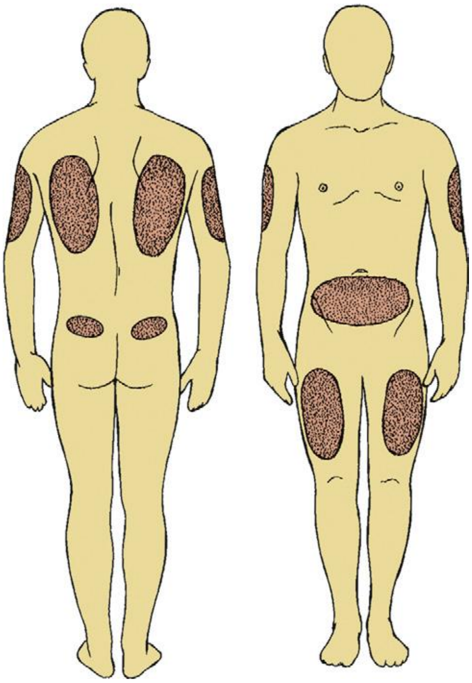
subcutaneous infusion. See **hypodermoclysis.**

subcutaneous injection, the introduction of a hypodermic needle into the subcutaneous tissue beneath the skin, usually on the upper arm, thigh, or abdomen. A 24- or 27-gauge needle 2 cm long is used. The drug is prepared and drawn into the syringe. The cleansed area of skin is held by the thumb and forefinger to tense and steady the injection site. The needle is inserted at an angle of 45 to 90 degrees, piercing the skin quickly and advancing steadily to minimize the pain. The barrel or plunger is withdrawn slightly to ascertain whether the syringe of the needle has inadvertently entered a blood vessel. If no blood is aspirated, the drug is injected slowly, the needle is withdrawn, and the skin is massaged gently (unless contraindicated) with a sterile alcohol sponge. Certain drugs that are extremely irritating to the skin are injected into the deep subcutaneous tissues by using a variation of the technique. The skin tissue overlying the injection site is grasped with the thumb and forefinger but elevated in a roll, rather than tensed and flattened. The angle of injection may be as great as 90 degrees to the skin. Heparin, insulin, and emetine are injected in this way. If subcutaneous injections are repeated, each is performed at least 5 cm from the previous site. A diagram of a plan for the rotation of injection sites helps to prevent overuse of one area of skin.

subcutaneous layer. See **subcutaneous fascia.**

subcutaneous mastectomy, a surgical procedure in which all of the breast tissue of one or both breasts is removed, leaving the skin, areola, and nipple intact. The adjacent lymph nodes, pectoralis major, and pectoralis minor are not removed. It may be performed on women who are at great risk of development of breast cancer. Reconstruction of the breasts is performed, with the assistance of a plastic surgeon, through the insertion of prostheses to return the normal contour to the breasts.

subcutaneous nodule, a small, solid mass, or node, beneath the skin that can be detected by touch. Subcutaneous



Subcutaneous injections *(Potter et al, 2011)*

nodules consisting chiefly of Aschoff bodies are found in patients with rheumatic fever. Minute subcutaneous nodules formed by the perivascular infiltration of mononuclear cells occur in typhus.

subcutaneous test. See **intradermal test.**

subcutaneous tunnel, a tunnel under the skin between the exit site of an atrial catheter and the entrance into the vein.

subcutaneous wound [L, *sub,* beneath, *cutis,* skin; AS, *wund*], an injury to internal organs, such as by crushing or another violent force, without a break in the surface of the skin. Also called **internal injury.**

subcuticular suture /-kyo͞otik′yələr/ [L, *sub,* beneath, *cutis,* skin, *sutura*], a continuous suture placed to draw together the tissues immediately beneath the skin. It may be either absorbable or nonabsorbable, requiring later removal.

subdermal /-der′məl/ [L, *sub* + Gr, *derma,* skin], beneath the dermis.

subdural /-d(y)o͞o′rəl/ [L, *sub* + *durus,* hard], pertaining to the area under the dura mater and above the arachnoid membrane.

subdural hematoma, an accumulation of blood in the subdural space, usually caused by an injury or fall. It can be acute with rapid bleeding or subacute with accumulation of blood over a longer period of time. Patients may have a chronic subdural hematoma that slowly occurs over an extended period of time, and some persons may have more than one bleed.

subdural hemorrhage, cerebral hemorrhage into the subdural space, often caused by trauma with resulting damage to the middle meningeal artery. See also **cerebrovascular accident, subdural hematoma.**

subdural hygroma, a collection of fluid between the dura mater and arachnoid layers resulting from a spinal fluid leak through a rupture in the arachnoid tissue.

subdural puncture, a perforation of the space between the dura mater and arachnoid membrane by a needle for the injection of diagnostic or therapeutic medications or for aspiration of blood or other fluid.

subdural space [L, *sub,* beneath, *dura, mater,* hard mother, *spatium*], the potential space between the dura mater and the arachnoid membrane.

subendocardial infarction /-en′dōkär′dē·əl/, a myocardial infarction that involves the innermost layer and, in some cases, parts of the middle layer of the myocardium but does not extend to the epicardium.

subepicardium /sub′ep--kahr′de-um/, subepicardial layer.

subepidermal /-ep′idur′məl/ [L, *sub,* beneath; Gk, *epi,* above, *derma,* skin], beneath the epidermis.

subepithelial hematoma of renal pelvis, a hematoma from bleeding in the subepithelial tissue of the renal pelvis, usually the result of a coagulopathy, such as in hemophilia, thrombocytopenia, or anticoagulant therapy. Also called **Antopol-Goldman lesion.**

subfertility /sub′fer-til′-te/, diminished reproductive capacity. Also called **hypofertility. —***subfertile, adj.*

subgerminal cavity. See **blastocoele.**

subgingival calculus. See **calculus.**

subgingival curettage, the debridement of an ulcerated epithelial attachment and subjacent gingival corium to eliminate inflammation and to shrink and restore gingival tissue. See also **apical curettage, root curettage.**

subglottic /-glot′ik/, beneath the glottis. Also called **infraglottic.**

subiculum /səbik′yələm/, a part of the hippocampal formation consisting of the transition zone between the parahippocampal gyrus and Ammon's horn.

subintimal /-in′timəl/ [L, *sub* + *intimus,* innermost], pertaining to the area beneath the intima or membrane lining a blood vessel, usually a large artery.

subinvolution, failure of a body part to return to its normal size and condition after enlargement from a functional activity. See **uterine subinvolution.**

subject contrast, the difference in x-ray beam intensities across the beam area after emerging from the part being radiographed.

subjective /-jek′tiv/ [L, *subjectus,* subject], **1.** pertaining to the essential nature of an object as perceived in the mind rather than to a thing in itself. **2.** existing only in the mind. **3.** that which arises within or is perceived by the individual, as contrasted with something that is modified by external circumstances or something that may be evaluated by objective standards. **4.** pertaining to a person who places excessive importance on his own moods, attitudes, or opinions; egocentric.

subjective data collection, the process in which data relating to the patient's problem are elicited from a patient or a patient's family. The data are retrieved from the patient's description of an event rather than from a physical examination, which provides objective data. The interviewer encourages a full description of the onset, the course, and the character of the problem and any factors that aggravate or ameliorate it. Compare **objective data collection.**

Subjective Global Assessment, a method of rating a patient's nutritional status, with subjective observations being given values on an ordinal scale. Factors assessed include weight change, appetite or anorexia, subcutaneous tissue and muscle, and GI symptoms.

subjective sensation, a feeling or impression that is not associated with or does not directly result from any external stimulus. See also **sensation,** def. 1.

subjective symptoms [L, *subjectus,* subject; Gk, *symptoma*], symptoms that are observed only by the patient and that cannot be objectively confirmed.

subjective vertigo, an inappropriate sensation of bodily movement.

subjects /sub′jekts/, participants, people, animals, or events selected for a study to examine a particular variable or condition, such as the effects of a new medication or therapy.

sublethal allele [L, *sub* + *letum,* death; Gk, *genein,* to produce], an allele whose presence causes abnormalities or impairs the functioning of an organism but does not cause its death. Compare **lethal allele.**

sublethal dose /-lē′thəl/ [L, *sub,* beneath, *letum,* death; Gk, *dosis,* giving], a dose of a potentially lethal substance that is not large enough to cause death.

subleukemic leukemia. See **aleukemic leukemia.**

sublimate /sub′limāt/ [L, *sublimare,* to lift up], to refine or divert instinctual impulses and energy from their immediate goal to one that can be expressed in a social, moral, or aesthetic manner acceptable to the person and the society.

sublimation /-limā′shən/ [L, *sublimare*], **1.** an unconscious defense mechanism by which an unacceptable instinctive drive is diverted to and expressed through a personally approved, socially accepted means. **2.** (in psychoanalysis) the process of diverting certain components of the sex drive to a socially acceptable, nonsexual goal. Compare **displacement. 3.** change in a physical state from the solid phase directly to the gas phase.

Sublimaze, a trademark for an opioid analgesic (fentanyl).

subliminal /-lim′inəl/ [L, *sub* + *limen,* threshold], taking place below the threshold of sensory perception or outside the range of conscious awareness.

subliminal self [L, *sub,* beneath, *limen,* threshold; AS, *self*], a level of mental activity at which an individual under normal waking conditions may function without consciousness. See also **preconscious, unconscious.**

sublingual /səbling′gwəl/ [L, *sub* + *lingua,* tongue], pertaining to the area beneath the tongue.

sublingual administration of a medication, the administration of a drug, usually in tablet form, by placing it beneath the tongue until the tablet dissolves. Administering drugs such as nitroglycerin by this route rather than by swallowing avoids the extensive first-pass metabolism of nitroglycerin that occurs in the liver.

sublingual caruncle [L, *sub,* beneath, *lingua,* tongue, *caruncula,* small piece of flesh], a small fleshy growth under the tongue.

sublingual duct. See **Bartholin's duct, duct of Rivinus.**

sublingual fold, an elongate fold of mucosa raised by the superior margin of the sublingual gland. It extends from the posterolateral aspect of the floor of the oral cavity to the sublingual papilla beside the base of the frenulum of the tongue at the midline anteriorly.

sublingual gland, one of a pair of small salivary glands situated under the mucous membrane of the floor of the mouth, beneath the tongue. It is a narrow, almond-shaped structure and has from 8 to 20 ducts, some of which join to form the sublingual duct. The sublingual gland secretes mucus produced by its alveoli. Compare **parotid gland, submandibular gland.**

subluxation. See **incomplete dislocation.**

subluxation complex /-luksā′shən/, a theoretic chiropractic model of motion-segment dysfunction that incorporates the complex interaction of pathological changes in nervous, muscular, ligamentous, vascular, and connective tissues.

subluxation syndrome, an aggregate of signs and symptoms in chiropractic that relate to pathophysiological characteristics or dysfunction of spinal and pelvic motion segments or to peripheral joints.

submandibular /-məndib′yələr/ [L, *sub* + *mandible*], pertaining to the area beneath the mandible, or lower jaw. Also called **inframandibular.**

submandibular duct [L, *sub* + *mandere,* to chew], a duct through which a submandibular gland secretes saliva. Also called **submaxillary duct of Wharton, Wharton's duct.**

submandibular gland, one of a pair of round, walnut-sized salivary glands in the submandibular triangle that open on a small papilla at the side of the frenulum linguae. The gland secretes both mucus and a thinner serous fluid, which aid the digestive process. Compare **parotid gland, sublingual gland.** See also **salivary gland.**

submarginal /sub·mär′ji·nəl/ [L, *sub,* beneath + *margo,* margin], inferior to or beneath a margin.

submaxillary /-mak′siler′ē/ [L, *sub* + *maxilla*], pertaining to the area below the maxilla, or upper jaw.

submaxillary duct of Wharton. See **submandibular duct.**

submeatal /-mē·ā′təl/ [L, *sub,* beneath, *meatus,* passage], pertaining to tissues beneath a meatus, such as the mastoid air cells under the acoustic meatus or the hard palate beneath the nasal meatus.

submental /-men′təl/ [L, *sub* + *mentum,* chin], pertaining to the area beneath the chin.

submentovertex /-men′tōvur′teks/ [L, *sub* + *mentum,* chin, *vertex,* peak], pertaining to a radiographic projection of the skull in which x-rays enter just behind the chin and exit at the top of the head.

submetacentric /sub′metəsen′trik/ [L, *sub* + Gk, *meta,* besides, *kentron,* center], pertaining to a chromosome in which the centromere is located approximately equidistant between the center and one end so that the arms of the chromosomes are not equal in length. Compare **acrocentric, metacentric, telocentric.**

submucous /-m(y)o͞o′kəs/, pertaining to a location beneath a mucous membrane. **—submucosal,** *adj.*

submucous plexus, one of the two interconnected nerve plexuses of the enteric nervous system. See also **myenteric plexus.**

submucous resection (SMR) [L, *sub* + *mucous* + *re* + *secare,* to cut], a surgical procedure for correcting a deviated nasal septum, leaving the mucous membrane of the septum intact.

subnormal temperature /-nôr′məl/, temperature below the normal body level of 98.6° F (37° C).

suboccipital muscles, a small group of deep muscles in the upper cervical region at the base of the occipital bone that move the head. They include the rectus capitis posterior major, the rectus capitis posterior minor, the obliquus capitis inferior, and the obliquus capitis superior.

suboccipitobregmatic /-aksip′itō′bregmat′ik/ [L, *sub* + *occiput,* back of the head; Gk, *bregma,* front of the head], pertaining to the smallest anteroposterior diameter of an infant's neck when it is well flexed during labor.

subperiosteal fracture /sub′perē·os′tē·əl/ [L, *sub* + Gk, *peri,* around, *osteon,* bone], a fracture in a bone beneath the periosteum that does not disrupt the periosteum.

subphrenic /-fren′ik/ [L, *sub* + Gk, *phren,* diaphragm], pertaining to the area under the diaphragm.

subphrenic abscess [L, *sub,* beneath; Gk, *phren,* diaphragm; L, *abscedere,* to go away], an abscess that develops on or near the undersurface of the diaphragm, usually as a result of peritonitis or from another visceral site.

subpoena /-pē′nə/ [L, *sub* + *poena,* penalty], (in law) a document from a court commanding that a person appear at a certain time and place to testify on a specific matter. Subpoenas are governed by federal rules for criminal and civil procedures.

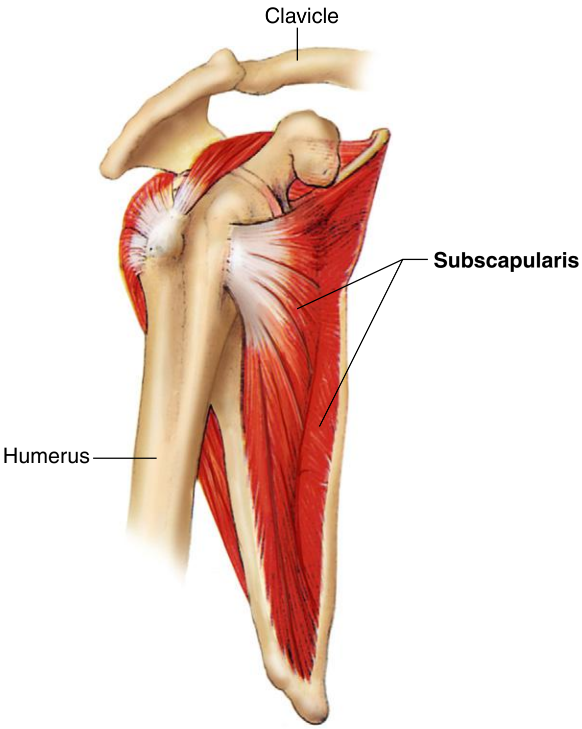
subpoena duces tecum, (in law) a subpoena commanding a person to take books, papers, records, or other items to the court.

subpopliteal recess, the smaller of two expansions in the synovial membrane of the knee that lies between the lateral meniscus and the tendon of the popliteus muscle and provides a low-friction surface for the movement of tendons associated with the joint. The larger expansion is the suprapatellar bursa.

subpubic dislocation. See **dislocation of the hip.**

subscapular artery, the largest branch of the axillary artery and the major blood supply to the posterior wall of the axilla. It also contributes to the blood supply of the posterior scapular region.

subscapularis /-skap′yəler′is/ [L, *sub,* beneath, *scapulae,* shoulder blades], the muscle arising from the subscapular fossa with insertion in the humerus. It functions to rotate the arm medially.



Subscapularis *(Patton and Thibodeau, 2010)*

subscapular nerves, branches of the brachial plexus that innervate the subscapularis muscle. The inferior subscapular nerve also innervates the teres major muscles.

subscriber, (in managed care) an individual, agency, or employer that has contracted for services under a health plan.

subserous fascia /-sir′əs/ [L, *sub* + *serum,* whey, *fascia,* band], one of three kinds of fascia lying between the internal layer of deep fascia and the serous membranes lining the body cavities in much the same manner as the subcutaneous fascia lies between the skin and the deep fascia. It is thin in some areas, such as between the pleura and the chest wall, and thick in other areas, where it forms a pad of adipose tissue. Compare **deep fascia, subcutaneous fascia.**

subsistence /-sis′təns/ [L, *subsistere,* to stand still], the state of being sustained or remaining alive with a minimum of life essentials.

subspecialty /-spesh′əltē/ [L, *sub* + *specialis,* individual], (in nursing) a nurse's particular highly specific professional field of practice, such as dialysis, oncology, neurology, or newborn intensive care nursing. Compare **specialty.**

subspinale /sub′spī·nā′lē/, the deepest midline point on the maxilla on the concavity between the anterior nasal spine and the prosthion. Also called **point A.**

substance /sub′stəns/ [L, *substantia,* essence], **1.** any drug, chemical, or biological entity. **2.** any material capable of being self-administered or abused because of its physiological or psychological effects.

substance abuse, the overindulgence in and dependence on a stimulant, depressant, or other chemical substance, leading to effects that are detrimental to the individual's physical or mental health, or the welfare of others.

Substance Abuse and Mental Health Services Administration (SAMHSA), an agency of the U.S. Department of Health and Human Services with the function of disseminating accurate and up-to-date information about and providing leadership in the prevention and treatment of addictive and mental disorders.

substance abuse testing, a screening of the urine or blood, or another kind of test, to identify drug use or drug overdose or poisoning from substances such as lead and carbon monoxide.

substance addiction consequences, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of change in health status and social functioning due to substance addiction. See also **Nursing Outcomes Classification.**

substance dependence, a maladaptive pattern of substance abuse leading to clinically significant impairment or distress as manifested by three or more episodes within a 12-month period of tolerance, withdrawal, or use of larger amounts or, over a longer period, a persistent desire or unsuccessful effort to control substance abuse or investment of a great deal of time in activities necessary to obtain the substance.

substance P, a polypeptide neurotransmitter that stimulates vasodilation and contraction of intestinal and other smooth muscles. It also plays a part in salivary secretion, diuresis, natriuresis, and pain sensation. It has been isolated from certain cells of the GI and biliary tracts.

substance use prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of an alcoholic or drug-use lifestyle. See also **Nursing Interventions Classification.**

substance use treatment, a nursing intervention from the Nursing Interventions Classification (NIC) defined as supportive care of patient/family members with physical and psychosocial problems associated with the use of alcohol or drugs. See also **Nursing Interventions Classification.**

substance use treatment: alcohol withdrawal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of the patient experiencing sudden cessation of alcohol consumption. See also **Nursing Interventions Classification.**

substance use treatment: drug withdrawal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as care of a patient experiencing drug detoxification. See also **Nursing Interventions Classification.**

substance use treatment: overdose, a nursing intervention from the Nursing Interventions Classification (NIC) defined as monitoring, treatment, and emotional support of a patient who has ingested prescription or over-the-counter drugs beyond the therapeutic range. See also **Nursing Interventions Classification.**

substance withdrawal severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of physical and psychological signs or symptoms caused by withdrawal from addictive drugs, toxic chemicals, tobacco, or alcohol. See also **Nursing Outcomes Classification.**

substandard /-stan′dərd/ [L, *sub,* beneath; OFr, *estandart*], below the predetermined model or measure.

substantia alba /-stan′shə/ [L, *substantia,* essence, *albus,* white], the part of the central nervous system that is enclosed in myelin sheaths. The myelin contributes a white coloring to otherwise gray nerve tissue.

substantia gelatinosa. See **Rolando's gelatinous substance.**

substantia innominata, nerve tissue immediately inferior to the anterior perforated substance and anterior to the globus pallidus and ansa lenticularis.

substantia nigra [L, *substantia,* essence, *niger,* black], a dark band of gray matter lying between the tegmentum of the midbrain and the crus cerebri.

substantive epidemiology /sub′stəntiv/ [L, *substantia* + Gk, *epi,* upon, *demos,* people, *logos,* science], the body of knowledge derived from epidemiological studies, including, for each disease, the natural history of the disorder, patterns of occurrence, and risk factors for development of the disorder.

substantivity /-stəntiv′itē/, the property of continuing therapeutic action despite removal of the vehicle, such as the action of certain shampoos.

substernal /-stur′nəl/ [L, *sub* + Gk, *sternon,* chest], pertaining to the area beneath the sternum.

substernal goiter [L, *sub* + Gk, *sternon,* chest; L, *guttur,* throat], a nonbacterial inflammation of the lower thyroid isthmus, often preceded by a viral infection causing fever, tenderness, and enlargement of the thyroid gland. Symptoms may last 2 to 4 months and are usually resolved by corticosteroids. See also **thyroiditis.**

substitution /-stit(y)o͞o′shən/, a mental defense mechanism, operating unconsciously, by which an unattainable or unacceptable goal, emotion, or object is replaced by one that is more attainable or acceptable.

substitutive therapy /sub′stit(y)o͞o′tiv/ [L, *substituere,* to put in place of; Gk, *therapeia,* treatment], a treatment that affects a condition incompatible with or antagonistic to the condition being treated. Also called **allopathy.**

substrate /sub′strāt/ [L, *sub* + *stratum,* layer], a chemical acted on and changed by an enzyme in a chemical reaction.

substrate depletion phase, a period during an enzyme assay when the concentration of substrate is falling and the assay is not following zero-order kinetics.

substratum /-strā′təm/ [L, *sub* + *stratum,* layer], any underlying layer; a foundation.

sub-, suf-, sup-, prefix meaning "under, below, down, near, almost, or moderately": *subacid, subdental.*

subsystem /sub′sistəm/, a smaller component of a large system composed of individuals or dyads, formed by generation, gender, interest, or function.

subtalar joint, the joint between the large posterior calcaneal facet on the inferior surface of the talus and the corresponding posterior talar facet on the superior surface of the calcaneus. It allows gliding and rotation, which are involved in inversion and eversion of the foot.

subtask work, a part of the whole task in a rehabilitation program but distinguished by changes in speed or direction.

subthalamic. See **subthalamus.**

subthalamic nucleus, a biconvex mass of gray matter on the medial side of the junction of the internal capsule and the crus cerebri. Its chief connections are with the globus pallidus.

subthalamus /-thal′əməs/ [L, *sub* + Gk, *thalamos,* chamber], a part of the diencephalon that serves as a correlation center for optic and vestibular impulses relayed to the globus pallidus. It is a transition zone between the thalamus and the tegmentum mesencephali. Compare **epithalamus, hypothalamus, metathalamus, thalamus.** **—subthalamic,** *adj.*

subtle /sut′əl/ [L, *subtilis*], **1.** having a low intensity. **2.** not severe and having no serious sequelae, such as a mild infection or inflammation.

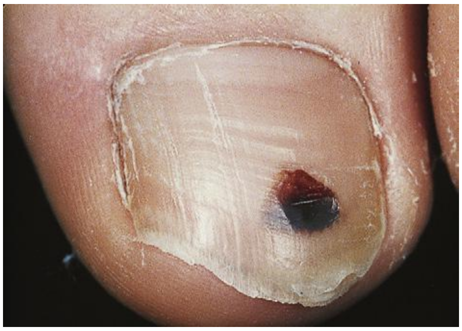
subtotal /sub′tōtəl/ [L, *sub,* beneath, *totus,* whole], less than complete.

subtotal hysterectomy [L, *sub* + *totus* + Gk, *hystera,* womb, *extome,* excision], the surgical removal of the body of the uterus without removing the cervix. See also **supracervical hysterectomy, supravaginal hysterectomy.**

subtrochanteric osteotomy /-trō′kənter′ik/ [L, *sub* + Gk, *trochanter,* runner, *osteon,* bone, *temnein,* to cut], a surgical procedure that divides the shaft of the femur below the lesser trochanter to correct ankylosis of the hip joint.

subungual /səbung′gwəl/ [L, *sub* + *unguis,* nail], beneath a fingernail or toenail.

subungual hematoma, a collection of blood beneath a nail that usually results from trauma. The pain accompanying this condition may be quickly alleviated by burning or drilling a small hole through the nail to release the blood.



Subungual hematoma *(du Vivier, 2002)*

subunit vaccine /sub′yo͞onit/, a viral immunizing agent that has been treated to remove traces of viral nucleic acid so that only protein subunits remain. The subunits have less risk of causing adverse reactions.

subventricular zone /-ventrik′yələr/, an area, located between the ventricular and intermediate zones in the fetal forebrain, in which neurons of the cerebrum are generated.

subzonal insemination (SUZI), an older technique of micromanipulation used in cases of male factor infertility. Spermatozoa are inserted into the perivitelline space after breaching of the zona pellucida by mechanical or chemical means. Also called *subzonal injection.*

subzygomatic, below the zygomatic bone.

succ-, prefix meaning "juice": *succagogue, succorrhea, succus.*

succenturiate placenta. See **accessory placenta.**

succi. See **succus.**

succinic acid ($HOOC(CH_2)_2COOH$) /suksin′ik/, a dicarboxylic acid found in certain hydatid cysts and in lichens, amber, and fossils. Commercial succinic acid, produced by the fermentation of ammonium tartrate, is used in lacquer and dyes. Succinic acid was formerly used in the treatment of diabetic ketoacidosis.

succinylcholine chloride /suk′sinilkō′lēn/, a depolarizing neuromuscular blocker that is a skeletal muscle relaxant.

■ INDICATIONS: It is prescribed to provide an adjunct to anesthesia, to reduce muscle contractions during surgery or mechanical ventilation, and to facilitate endotracheal intubation.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Caution is used in administering it to patients with a family history of malignant hyperthermia, those with low pseudocholinesterase levels, and those with myasthenia gravis or renal failure.

■ ADVERSE EFFECTS: Among the more serious adverse effects are cardiac arrhythmia, severe respiratory depression, and (rarely) malignant hyperthermia.

succus /suk′əs/ *pl.* **succi** [L, juice], a juice or fluid, usually one secreted by an organ, such as succus prostaticus of the prostate.

succussion splash /səkush′ən/ [L, *succutere,* to shake up; ME, *plasche,* puddle], the sound elicited by shaking the body of a person who has free fluid and air or gas in a hollow organ or body cavity. This sound may be present over a normal stomach but also may be heard with hydropneumothorax, large hiatal hernia, or intestinal or pyloric obstruction.

suck [L, *sugere,* to suck], **1.** to draw a liquid or semiliquid into the mouth by creating a partial vacuum through motions of the lips and tongue. **2.** to hold on the tongue and dissolve by the movements of the mouth and action of the saliva. **3.** to draw fluid into the mouth, specifically to draw milk from the breast or nursing bottle.

sucking blisters, the pale soft pads on the upper and lower lips of a baby that look like blisters but are not. They form as soon as the baby begins to suck well at the breast or on a bottle. They seem to augment the seal of the lips around the nipple or breast. Some babies, who have sucked on their own fingers, hands, or arms before birth, are born with them.

sucking reflex, involuntary sucking movements of the circumoral area in newborns in response to stimulation. The reflex continues throughout infancy and often occurs without stimulation, such as during sleep. Compare **rooting reflex.**

suckle [L, *sugere*], **1.** to provide nourishment, specifically to breastfeed. **2.** to take in nourishment, especially by feeding from the breast.

suckling, an infant that has not been weaned.

suck-swallow reflex, rhythmic sucking and swallowing movements in an infant when a finger or nipple is placed in the mouth.

Sucostrin, a trademark for a depolarizing neuromuscular-blocker agent (succinylcholine).

sucrose /so͞o′krōs/ [Fr, *sucre,* sugar], a disaccharide sugar derived from sugar cane, sugar beets, and sorghum and made up of one molecule of glucose and one of fructose joined together in a glycosidic linkage.

sucrose polyester (SPE), a synthetic nonabsorbable fat that, when added to the diet, reduces plasma cholesterol levels by increasing the excretion of cholesterol in the feces. It is formulated to have the characteristic texture, taste, and consistency of regular margarine or vegetable oil and adds no calories to the diet.

suction /suk′shən/ [L, *sugere,* to suck], the aspiration of a gas or fluid by reducing air pressure over its surface, usually by mechanical means.

suction biopsy [L, *sugere,* to suck; Gk, *bios,* life, *opsis,* view], a procedure for obtaining tissue or fluid samples from lymph nodes or a deep lesion by using suction and a trocar or cannula. Also called **aspiration biopsy.**

suction curettage. See **vacuum aspiration.**

suction drainage. See **drainage.**

suction lipectomy. See **liposuction.**

Sudafed, a trademark for an adrenergic vasoconstrictor used as a decongestant **(pseudoephedrine hydrochloride).**

sudden cardiac arrest (SCA), an abrupt, complete loss of heart function that results in loss of blood circulation within the body. An episode of sudden cardiac arrest may be preceded by arrhythmias, including ventricular tachycardia or fibrillation. It is not caused by the blockage of coronary arteries. Within the United States, as many as 450,000 persons may experience sudden cardiac arrest each year; survivors face a 30% to 50% chance of experiencing a repeat episode. Sudden cardiac arrest is reversible in most patients if it is treated within minutes. Compare **myocardial infarction** and **acute myocardial infarction.**

sudden death [ME, *sodain,* to come up; AS, *death*], death that occurs unexpectedly and from 1 to 24 hours after the onset of symptoms, with or without known preexisting conditions.

sudden infant death syndrome (SIDS) [ME, *sodain,* to come up; L, *infans,* unable to speak; AS, *death* + Gk, *syn,* together, *dromos,* course], the unexpected and sudden death of an apparently normal and healthy infant that occurs during sleep, with no physical or autopsic evidence of disease. It is the most common cause of death in children under 1 year of age, with an incidence rate of 1 in every 300 to 350 live births. In the last few years, death scene investigations have been helpful in identifying an unsafe sleep environment as a contributing factor in SIDS cases and it is now recognized that many of these infant deaths are due to asphyxiation and suffocation. In 1992 a report by the American Academy of Pediatrics Task Force on Infant Positioning and SIDS recommended that infants be laid down for sleep in a nonprone position; and in 1994 a “Back to Sleep” campaign was jointly initiated by the American Academy of Pediatrics (AAP) and the National Institute of Child Health and Human Development. Over the next five years, the rate of prone sleep positioning and the rate of SIDS both decreased. Since 2001, the rate has been relatively constant. It is known that the risk of SIDS increases after the first month of life and peaks at 2 to 4 months of age. Infants should be placed for sleep supine as a preventive measure. Nursing considerations consist predominantly of support and counseling, such as assessing how the parents feel about the death to help them through the resolution of grief, learning what they know about the syndrome, supplying them with whatever information and literature they need, and finding out how they are coping with any guilt feelings and how the siblings, if any, are coping with the death. The nurse also can supply information about local groups of parents who have lost a child from SIDS. Also called **cot death, crib death.** See also **parental grief.**

sudo-, prefix meaning “sweat”: *sudogram, sudokeratosis, sudorrhea.*

sudor /so͞o′dôr/ [L, sweat], perspiration.

sudoriferous duct /so͞o′dərif′ərəs/ [L, *sudor,* sweat, *facere,* to make], a duct leading from a sweat gland to the surface of the skin. Each sweat duct is the most superficial part of a coiled tube that forms the body of each sweat gland and opens onto the surface through a funnel-shaped opening. The sweat ducts in the armpits and in the groin are larger than in other parts of the body. Also called **sweat duct.**

sudoriferous gland, one of about 2 million tiny structures within the dermis that produce perspiration and secrete it via a sudoriferous duct to the skin’s surface. The average quantity of perspiration secreted in 24 hours varies from 700

Epidemiology of SIDS in the United States

Factors	*Occurrence*
Incidence	54.5 per 100,000 live births (2006) (Heron M, Hoyert DL, Murphy SL, et al, 2009)
Peak age	2-3 mo; 95% occur by 6 mo; preterm infants die from sudden infant death syndrome (SIDS) at mean age of 6 wk later than mean age of death from SIDS for term infants
Sex	Higher percentage of males affected
Time of death	During sleep
Time of year	Increased incidence in winter
Racial	Greater incidence in Native Americans, African-Americans, and Hispanics
Socioeconomic	Increased occurrence in lower socioeconomic class
Birth	Higher incidence in: Preterm infants, especially infants of low birth weight Multiple births* (higher risk in 2nd twin, male twin, and small-for-date twin) Neonates with low Apgar scores Infants with central nervous system disturbances and respiratory disorders Infants with a recent history of mild illness
Sleep habits	Prone position; use of soft bedding or pillow; overheating (thermal stress); cosleeping with adult, especially on sofa, or noninfant bed
Feeding habits	Lower incidence in breast-fed infants Lower incidence in infants put to sleep with pacifier
Siblings	May have greater incidence in siblings of SIDS victims
Maternal factors	Young age; cigarette smoking, especially during pregnancy; poor prenatal care; substance abuse (heroin, methadone, cocaine)

*Although a rare event, simultaneous death of twins from sudden infant death syndrome can occur.

Modified from Hockenberry MJ, Wilson D: *Wong's nursing care of infants and children*, ed 9, St Louis, 2011, Mosby.

Data from American Academy of Pediatrics, Task Force on Sudden Infant Death Syndrome: The changing concept of sudden infant death syndrome: diagnostic coding shifts, controversies regarding the sleeping environment, and new variables to consider in reducing risk, *Pediatrics* 116(5):1245-1255, 2005; American Academy of Pediatrics, Task Force on Infant Sleep Position and Sudden Infant Death Syndrome: Changing concepts of sudden infant death syndrome: implications for infant sleeping environment and sleep position, *Pediatrics* 105(3):650-656, 2000; Heron, M, Hoyert, DL, Murphy, SL, et al.: Deaths: final data for 2006. *Natl Vital Stat Rep*. 57(14), 2009, 1–134.

to 900 g. Each sudoriferous gland consists of a single tube with a deeply coiled body and a superficial duct. The number of glands per square centimeter of skin varies in different parts of the body. The sudoriferous glands are very plentiful on the palms of the hands and on the soles of the feet, least numerous in the neck and the back, and completely absent in the deeper parts of the external auditory meatus, the prepuce, and the glans penis. Most are **eccrine glands**, producing perspiration that carries away sodium chloride, the waste products urea and lactic acid, and the breakdown products from garlic, spices, and other substances. **Apocrine sweat glands** associated with the coarse hair of the armpits and the pubic region are larger and secrete fluid that is much thicker than that secreted by the eccrine glands. Also called **sweat gland.** Compare **sebaceous gland.**

sudorific /so͞o′dərif′ik/ [L, *sudor,* sweat, *facere,* to make], **1.** *adj,* pertaining to a substance or condition, such as heat or emotional tension, that promotes sweating. **2.** *n,* a sudorific agent. Sweat glands are stimulated by cholinergic drugs. The alkaloid pilocarpine is a potent sudorific drug, but it is rarely used for that purpose in modern medicine. Also called **diaphoretic.**

suf-. See **sub-.**

Sufenta, a trademark for an opioid analgesic used in balanced anesthesia **(sufentanil citrate).**

sufentanil /soo-fen′tah-nil/, a potent opioid analgesic derived from fentanyl, the citrate salt is used as an anesthetic or anesthesia adjunct. It is also used for the treatment of obstetric pain.

sufentanil citrate /sufen′tənil/, an analgesic and anesthetic.

■ INDICATIONS: It is administered intravenously as an adjunct to general anesthesia and can be used in higher amounts together with 100% oxygen as a primary anesthetic.

■ CONTRAINDICATIONS: Hypersensitivity to sufentanil prohibits its use. It should be used with caution in people with respiratory depression or renal, hepatic, or pulmonary failure.

■ ADVERSE EFFECTS: Among the more serious adverse effects are respiratory depression, chest wall rigidity, hypotension, bradycardia, and nausea and vomiting. There must be ready availability of drugs and equipment needed to treat such adverse effects.

suffering severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of anguish associated with a distressing symptom, injury, or loss that has potential long-term effects. See also **Nursing Outcomes Classification.**

suffocation /suf′əkā′shən/ [L, *suffocare,* to choke], an interruption in breathing with oxygen deprivation, usually caused by an obstruction in the airways. The condition may be accidental or intentional or may result from disease or inadequate levels of respirable gases in the atmosphere.

suffocative goiter /suf′əkā′tiv/ [L, *suffocare,* to choke, *guttur,* throat], an enlargement of the thyroid gland that causes a sensation of suffocation when pressed.

sugar /sho͝og′ər/ [Gk, *sakcharon*], any of several water-soluble simple carbohydrates. The principal categories of sugars are monosaccharides, disaccharides, and polysaccharides. A monosaccharide is a single sugar, such as glucose, fructose, or galactose. A disaccharide is a double sugar, such as sucrose (table sugar) or lactose. A polysaccharide is a sugar made up of repeating units of glucose, such as cellulose, starch, and glycogen. Sugars play an important role in biology by either forming conjugates with other biomolecules (e.g., glycoproteins) or by mediating cell surface recognition events (e.g., bacterial or viral binding to cells). See also **carbohydrate, fructose, galactose, glucose, saccharide, sucrose.**

sugar alcohol, an alcohol produced by the reduction of an aldehyde or ketone of a sugar.

sugar cataract, a visual disorder associated with diabetes in which sorbitol collects within the lens, causing an osmotic gradient of fluid in the lens. This condition leads to a disruption of the lens matrix and loss of transparency.

suggestibility /səjes′tibil′itē/, pertaining to a person's susceptibility to having his or her ideas or actions influenced or altered by others.

suggestion /səjes′chən/ [L, *suggerere,* to propose], **1.** the process by which one thought or idea leads to another, as in the association of ideas. **2.** the use of persuasion, exhortation, or another technique to implant an idea, thought, attitude, or belief in the mind of another as a means of influencing or altering behavior or states of mind. See also **hypnosis. 3.** an idea, belief, or attitude implanted in the mind of another. Compare **autosuggestion.**

suicidal /so͞o′isī′dəl/ [L, *sui,* of oneself, *caedere,* to kill], of, relating to, or tending toward self-destruction.

suicide /so͞o′isīd/ [L, *sui,* of oneself, *caedere,* to kill], **1.** the intentional taking of one's own life. **2.** *(informal)* the ruin or destruction of one's own interests. **3.** a person who commits or attempts self-destruction. Early signs of suicidal intent include depression; expressions of guilt, tension, and agitation; insomnia; loss of weight and appetite; neglect of personal appearance; giving away of personal or valued possessions; and direct or indirect threats to commit suicide.

suicide gesture, (in psychiatric nursing) an apparent attempt by a patient to cause self-injury without lethal consequences and generally without actual intent to commit suicide. A suicide gesture serves to attract attention to the patient's disturbed emotional status but is not as serious as a suicide attempt, although it may result in suicide, intentional or not.

suicide prevention, a nursing intervention from the Nursing Interventions Classification (NIC) defined as reducing the risk for self-inflicted harm with intent to end life. See also **Nursing Interventions Classification.**

suicide prevention center, a crisis-intervention facility dealing primarily with people preoccupied with suicidal thoughts. Such facilities are usually operated by professional social workers with special training in counseling possible suicide victims in person or by telephone.

suicide self-restraint, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to refrain from gestures and attempts at killing oneself. See also **Nursing Outcomes Classification.**

suicidology /so͞o′isīdol′əjē/ [L, *sui* + *caedere* + Gk, *logos,* science], the study of the prevention and causes of suicide. —*suicidologist, n.*

Sular, a trademark for a calcium channel blocker **(nisoldipine).**

sulcate, sulci. See **sulcus.**

sulconazole /sul-kon′ah-zōl/, a broad-spectrum topical antifungal agent, used as the nitrate salt in treatment of athlete's foot, ringworm, and *Candida* infections.

sulcoplasty. See **vestibuloplasty.**

sulculus /sul′kyələs/ [L, *sulcus*], a small sulcus.

sulcus /sul′kəs/ *pl. sulci* [L, furrow], a shallow depression, or furrow on the surface of an organ, such as cerebral sulcus that separates the convolutions of the cerebral hemisphere. A sulcus is usually not as deep as a fissure, but, in the terminology of anatomy, the words *sulcus* and *fissure* are often used interchangeably. —**sulcate,** *adj.*

sulcus centralis cerebri. See **central sulcus.**

sulcus terminalis cordis. See **terminal sulcus of the right atrium.**

sulfa-, prefix for sulfonamide antimicrobials.

sulfacetamide /sul′fəset′əmīd/, a topical antibacterial.

■ INDICATIONS: It is most commonly prescribed for the prophylaxis of infection after injury to the cornea and in the treatment of bacterial conjunctivitis and bacterial infections of the skin.

■ CONTRAINDICATIONS: Known hypersensitivity to the drug or to other sulfonamides or impaired kidney function prohibits its use.

■ ADVERSE EFFECTS: Among known adverse effects are local pain, overgrowth of nonsusceptible pathogens, and hypersensitivity reaction.

Sulfacet-R, a trademark for a fixed-combination topical antiacne medication containing a keratolytic **(sulfur),** an antibacterial (sulfacetamide sodium), and a physical barrier (zinc oxide).

sulfADIAZINE /sul′fədī′əzēn/, a sulfonamide antibacterial.

■ INDICATIONS: It is prescribed in the treatment of infection, particularly of the urinary tract, and in rheumatic fever prophylaxis.

■ CONTRAINDICATIONS: Porphyria, urinary tract obstruction, or known hypersensitivity to sulfonamides prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are crystalluria, photosensitivity, severe allergic reactions, and blood dyscrasias.

sulfadoxine /sul′fah-dok′sēn/, a long-acting sulfonamide used in combination with pyrimethamine in the prophylaxis and treatment of malaria caused by chloroquine-resistant strains of *Plasmodium falciparum.* See also **antimalarial.**

sulfa drugs /sul′fə/, a group of bacteriostatic agents that inhibit the biosynthesis of folic acid.

sulfamethoxazole /sul′fəmethok′səzōl/, a sulfonamide antibacterial.

■ INDICATIONS: It is prescribed in the treatment of otitis media, prostatitis, epididymitis, bronchitis, and certain urinary tract infections.

■ CONTRAINDICATIONS: It is not given during the last trimester of pregnancy, during lactation, or to children less than 2 months of age. Known hypersensitivity to this drug or to other sulfonamides prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are crystalluria and rash, fever, and other allergic reactions.

sulfamethoxazole and trimethoprim /trīmeth′əprim/, a fixed-combination antibacterial.

■ INDICATIONS: It is prescribed in the treatment of urinary tract infections, otitis media, chronic bronchitis, traveler's diarrhea, and other infections caused by susceptible strains of bacteria and for *Pneumocystis jirovecii* pneumonitis prophylaxis.

■ CONTRAINDICATIONS: It is used with caution in patients with impaired renal or hepatic function, possible folate deficiency, or known hypersensitivity either to drug or to sulfonamides. It is not recommended for use in infants less than 2 months of age or in the third trimester of pregnancy.

■ ADVERSE EFFECTS: Among the more serious adverse effects are crystalluria and rashes, fever, and other allergic reactions.

Sulfamylon, a trademark for a topical antiseptic **(mafenide acetate).**

sulfanilamide /sul′fah-nil′ah-mīd/, a potent antibacterial compound. Although replaced as a systemic agent by more effective and less toxic derivatives and by antibiotics, it is still used vaginally in the treatment of vulvovaginal candidiasis.

sulfanilic acid /sul′fənil′ik/, a red-tinged white crystalline compound used in the synthesis of sulfonamides and as a reagent in tests for phenol, fecal matter in water, albumin, aldehydes, and glucose. Also called *para-aminobenzenesulfonic acid.*

sulfapyridine /sul′fah-pir′idēn/, a sulfonamide administered orally in treatment of dermatitis herpetiformis.

sulfasalazine /sul′fəsəlaz′ēn/, a sulfonamide, and aminosalicylic acid derivative. Also called **salicylazosulfapyridine.**

■ INDICATIONS: It is prescribed in the treatment of mild to moderate ulcerative colitis and as adjunctive therapy in severe cases. It is also used to treat juvenile- and adult-onset forms of rheumatoid arthritis and has investigational uses for other autoimmune disease, such as ankylosing spondylitis and Crohn's disease.

■ CONTRAINDICATIONS: Urinary obstruction, porphyria, or known hypersensitivity to this drug, to other sulfonamide medications, or to salicylates prohibits its use. It is not given during the last trimester of pregnancy.

■ ADVERSE EFFECTS: Among the more serious adverse effects are crystalluria, blood dyscrasias, and severe hypersensitivity reactions. GI symptoms and anorexia commonly occur.

sulfatase /sul′fə·tās/, any of a group of enzymes that catalyze the cleavage of inorganic sulfate from sulfate esters to form alcohols.

sulfate (SO_4^{2-}) /sul′fāt/, an anion of sulfuric acid. A sulfate is usually a combination of a metal with sulfuric acid. Natural sulfate compounds, such as sodium sulfate, calcium sulfate, and potassium sulfate, are plentiful in the body.

sulfatide lipidosis /sul′fətīd/, an inherited lipid metabolism disorder of childhood caused by a deficiency of cerebroside sulfatase enzyme. It results in an accumulation of metachromatic lipids in tissues of the central nervous system, kidney, spleen, and other organs, leading to dementia, paralysis, and death by 10 years of age. Also called **metachromatic leukodystrophy.** See also **lipidosis.**

sulfhemoglobin /sulfhem′əglō′bin/, a trace form of hemoglobin that contains an irreversibly bound sulfur molecule that prevents normal oxygen binding. Also spelled **sulphaemoglobin.**

sulfhemoglobinemia /-ē′mē·ə/, the presence of abnormal sulfur-containing hemoglobin circulating in the blood.

sulfinpyrazone /sul′finpir′əzōn/, a uricosuric drug.

■ INDICATIONS: It is prescribed in the treatment of chronic gout and intermittent gouty arthritis.

■ CONTRAINDICATIONS: Peptic ulcer, ulcerative colitis, renal dysfunction, or known hypersensitivity to this drug or to phenylbutazone prohibits its use. It is not usually given during an acute attack of gout.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI ulcers, blood dyscrasias, and dermatitis.

sulfiSOXAZOLE /sul′fisok′səzōl/, a sulfonamide antibiotic.

■ INDICATIONS: It is prescribed in the treatment of conjunctivitis and urinary tract infections, including vaginitis, cystitis, and pyelonephritis.

■ CONTRAINDICATIONS: Porphyria, urinary tract obstruction, or known hypersensitivity to this drug or to sulfonamide medications prohibits its use. It is not given during the last trimester of pregnancy or to children less than 2 months of age.

■ ADVERSE EFFECTS: Among the more serious adverse effects are crystalluria, blood dyscrasias, and severe hypersensitivity reactions.

sulfiting agents /sul′fīting/, food preservatives composed of potassium or sodium bisulfite or potassium metabisulfite. Sulfiting agents are used in the processing of beer, wine, baked goods, soup mixes, and some imported seafood and by restaurants to impart a "fresh" appearance to salad fruits and vegetables. The chemicals can cause a severe allergic reaction in people who are hypersensitive to sulfites. The reactions are marked by flushing, faintness, hives, headache, GI distress, breathing difficulty, and, in extreme cases, loss of consciousness and death.

sulfo- /sul′fō-, sul′fə-/, prefix naming chemical compounds, showing presence of divalent sulfur or of the group SO_2OH: *sulfomethane, sulfonamide, sulfophenol*.

sulfobromophthalein /sul′fəbrō′məfthal′ēn, -ē·in/, a substance used in its disodium salt form for evaluating the function of the liver.

sulfobromophthalein test, a liver function test in which the dye sulfobromophthalein sodium is introduced into the circulatory system and a blood sample is withdrawn 30 or 45 minutes later, depending on the dose injected. The parenchymal cells remove almost all of the dye within this time if they are functioning normally. The rate of removal is influenced by the blood flow through the portal circulation, the functioning capacity of the liver cells, and the patency of the biliary tract.

sulfonamide /səlfon′əmīd/, originally one of a large group of synthetic bacteriostatic drugs that are effective in treating infections caused by many gram-negative and gram-positive microorganisms. They are bacteriostatic rather than bactericidal. Some sulfonamides are short-acting, some are intermediate-acting, and some are long-acting, depending on the speed with which they are excreted. They are used in treating many urinary tract infections. A variety of other types of drugs have since been developed that are sulfonamide derivatives, including thiazide diuretics and some of the oral hypoglycemics. Some people are hypersensitive to the sulfonamides. Sulfonamides are given with caution to people who have impaired liver or kidney function, and they are not given in the last trimester of pregnancy or to young infants, because mental retardation sometimes can result. Hemolytic anemia; agranulocytosis; thrombocytopenia; or aplastic anemia, drug fever, and jaundice may occur, particularly with long-acting sulfonamides given for more than 10 days. Most sulfonamides are given orally.

sulfonates /sul′fənāts/, a class of anticholinesterase compounds used as insecticides.

sulfonylurea /sul′fənilyŏŏr′ē·ə/, an oral antidiabetic agent that stimulates the pancreatic production of insulin. Hypersensitivity to sulfonamides is a contraindication for using such agents, and ethanol consumption is incompatible with all sulfonylureas. These agents cross the placenta, and their use has been associated with a higher incidence of birth defects, making insulin the preferred drug in treating diabetes in pregnancy. Aspirin or other salicylates taken with any sulfonylurea may intensify the hypoglycemic effect.

sulfosalicylic acid /sul′fōsalisil′ik/, a white or faintly pink crystalline substance that is highly water soluble and is used as a reagent in tests for albumin and as an intermediate compound in the manufacture of dyes and surfactants.

Sulfoxyl, a trademark for a fixed-combination topical antiacne medication containing two keratolytics **(benzoyl peroxide** and **sulfur).** Benzoyl peroxide directly inhibits the growth of acne bacteria.

sulfur (S) /sul′fər/ [L], a nonmetallic, polyvalent, tasteless, odorless chemical element that occurs abundantly in yellow crystalline form or in masses, especially in volcanic areas. Its atomic number is 16, and its atomic mass is 32.07. It is used in the production of sulfuric acid and used in metallurgy, rubber vulcanization, petroleum refining, and many other industrial processes. Sulfur has been used in the treatment of gout, rheumatism, and bronchitis and as a mild laxative. The sulfonamides, or sulfa drugs, are used in the treatment of various bacterial infections. Also spelled **sulphur.**

sulfur dioxide, a colorless nonflammable gas used as an antioxidant in pharmaceutic preparations. It is also an important air pollutant, irritating the eyes and respiratory tract.

-sulfuric /sulf(y)o͞o′rik/, suffix meaning "compounds containing sulfur, especially in its highest valences": *hydrosulfuric, persulfuric, thiosulfuric*. Also spelled **sulphuric.**

sulfuric acid (H_2SO_4), a clear, colorless, oily, highly corrosive liquid that generates great heat when mixed with water. An extremely toxic substance, sulfuric acid causes severe skin burns, blindness on contact with the eyes, serious lung damage if the vapors are inhaled, and death if it is ingested. In industry, sulfuric acid is used in the manufacture of fertilizers, dyes, glue, and other acids; in the purifying of petroleum; and in the pickling of metals. Weak solutions of sulfuric acid are used in the treatment of gastric hypoacidity and serous diarrhea. Formerly called *oil of vitriol*.

sulfurous acid (H_2SO_3) /sul′fərəs/, a weak inorganic acid formed by dissolving sulfur dioxide in water, used as a chemical-reducing and bleaching agent. It has been used in medicine in skin lotions and nasal and throat sprays. Sulfites formed by the acid may be included in antiseptics, antifermentatives, and antizymotics. Sulfurous acid is stable only in aqueous solutions; it decomposes into sulfur dioxide and water on standing. It is a major component of acid rain.

sulindac /sulin′dek/, a nonsteroidal antiinflammatory agent.
■ INDICATIONS: It is prescribed in the treatment of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis.
■ CONTRAINDICATIONS: Pregnancy (3rd trimester), lactation, or known hypersensitivity to this drug, aspirin, or nonsteroidal antiinflammatory drugs prohibits its use. It is used with caution in patients who have upper GI tract disease or impaired renal function.
■ ADVERSE EFFECTS: Among the more serious adverse reactions are GI upset, peptic ulcer, dizziness, tinnitus, and skin rash.

sulphaemoglobin. See **sulfhemoglobin.**

sulphur. See **sulfur.**

-sulphuric. See **-sulfuric.**

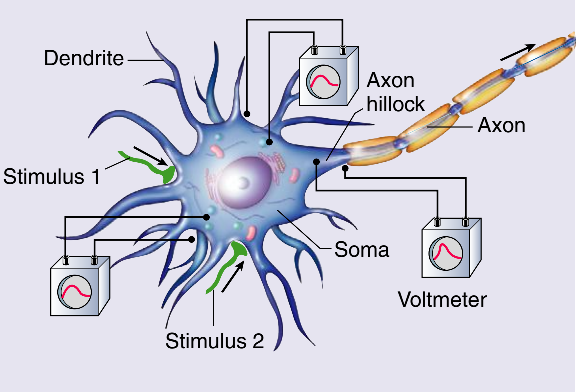
Sultrin Triple Sulfa, a trademark for a fixed-combination vaginal drug containing antibacterials (sulfathiazole, **sulfacetamide,** and sulfabenzamide).

sumac [Ar, *summaq*], any of a number of species of trees and shrubs in the Anacardiaceae family, including the ***Rhus*** species, which have poisonous properties. See **poison ivy, poison oak, poison sumac, rhus dermatitis.**

Poison sumac *(Auerbach, 2012/Courtesy Paul S. Auerbach)*

summary judgment [L, *summa,* total, *jus,* law, *dicere,* to state], (in law) a judgment requested by any party to a civil action to end the action when it is believed that there is no genuine issue or material fact in dispute. Summary judgment may be directed toward part or all of a claim or defense and may be based on the proceedings in court or on affidavits or other outside materials.

summation [L, *summa,* total], **1.** an accumulative effect or action; a total aggregate; totality. **2.** (in neurology) the concentration of a neurotransmitter at a synapse, either by increasing the frequency of nerve impulses in each fiber **(temporal summation)** or by increasing the number of fibers stimulated **(spatial summation)**, so that the threshold of the postsynaptic neuron is overcome and an impulse is transmitted. See also **facilitation,** def. 2.



Spatial summation *(Patton and Thibodeau, 2010)*

summation gallop, a gallop rhythm in which the third and fourth heart sounds are superimposed, appearing as one loud sound. It may occur in some patients with tachycardia but is usually associated with cardiac disease. See also **gallop.**

summons /sum′əns/ [OFr, *somondre,* to remind secretly], (in law) a document issued by a clerk of the court on the filing of a complaint. A sheriff, marshal, or other appointed person serves the summons, notifying a person that an action has been begun against him or her. See also **service of process.**

sump drain, a drainage device consisting of two tubes, one to allow fluid to be drained from a cavity and the other to allow air to enter the cavity to replace the fluid. It may be attached to a suction apparatus.

Sumycin, a trademark for an antibiotic **(tetracycline hydrochloride).**

sunburn, a skin injury characterized by redness, tenderness, and possible blistering that results from exposure to actinic radiation from the sun.

sundowning /sun′douning/ [AS, *sunne* + *ofdune,* off the hill], a condition in which persons with cognitive impairment and elderly people tend to become confused or disoriented at the end of the day. Many of them have diminished visual acuity and varying degrees of sensorineural and conduction hearing loss. With less light, they lose visual cues that help them to compensate for their sensory impairments. It may also be a result of decreased sensory stimulation, especially in the evening, when there is less environmental activity and less structure. Sundowning is most common with dementia, Alzheimer's type, and is seen with delirium.

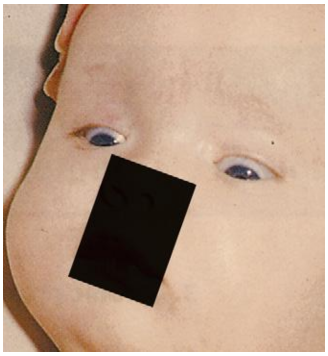
sunitinib, a miscellaneous antineoplastic.

- INDICATIONS: This drug is used to treat advanced renal carcinoma and GI stromal tumors after disease progression or intolerance to imatinib.
- CONTRAINDICATIONS: Pregnancy, lactation, and known hypersensitivity to this drug prohibit its use.
- ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, insomnia, fatigue, hypertension, altered taste, constipation, stomatitis, mucositis, skin discoloration, depigmentation of hair or skin, alopecia, pain, arthralgia, myalgia, cough, dyspnea, and electrolyte abnormalities. Life-threatening side effects include central nervous system hemorrhage, seizures, left ventricular dysfunction, hepatotoxicity, vomiting, dyspepsia, pancreatitis, neutropenia, thrombocytopenia, and bleeding. Common side effects include nausea, anorexia, abdominal pain, and rash.

sunrise syndrome, a condition of unstable cognitive ability on arising in the morning. Compare **sundowning.**

sunscreen protective factor index (SPF), a system of evaluating the effectiveness of various formulations for protecting the skin from actinic rays of the sun. Protective agents are rated from 1 to 50 by the U.S. Food and Drug Administration. A sunscreen protective factor of 15 means that the sunscreen provides 15 times the protection of unprotected skin. Among the most highly rated sunscreen lotions are nonopaque combinations of paraaminobenzoic acid ester and benzophenone, parol 1789 with incoxide and titanium dioxide.

sun-setting sign, a characteristic of hydrocephalus in which an infant's eyes appear to look only downward, with the sclera prominent over the iris.



[redacted]

Sun-setting sign *(Kanski and Nischal, 1999)*

sunstroke [AS, *sunne* + *strac,* stroke], a morbid condition caused by overexposure to the sun and characterized by a high temperature and altered level of consciousness. See also **heat hyperpyrexia.**

sup-. See **sub-.**

super-, prefix meaning "above, more than normal, or implying excess": *superduct, superfunction, supernumerary.*

superantigen, one of a family of related substances, including staphylococcal and streptococcal exotoxins, that can short-circuit the normal sequence of events leading to activation of helper T cells. Superantigens initiate an uncontrolled proliferation of T cells but do not require processing and presentation by macrophages. The result is either an acute and potentially life-threatening disease, such as toxic shock syndrome, or a chronic inflammatory process, such as rheumatic fever.

supercoat, a protective layer of gelatin to provide protection from scratches and pressure damage of radiographic film. Also called **abrasion layer** or **overcoat.**

supercoiling, the underwinding or overwinding of a DNA helix. See also **DNA gyrase.**

supercomputers, high-performance computing equipment capable of handling massive amounts of research and clinical data at speeds more than 1000 times that of most computer equipment. Supercomputer hardware and software may offer a potential of connecting thousands of research facilities and transmitting data at rates up to one billion bits per second. Proposed high-performance computers could quickly analyze archived medical data about worldwide populations, determining, for example, the "normal" human blood pressure on the basis of records of millions of patients.

superego /ē′gō/ [L, *super,* over; *ego,* I], (in psychoanalysis) that part of the psyche, functioning mostly in the unconscious, that develops when the standards of the parents and of society are incorporated into the ego. The superego has two parts, the conscience and the ego ideal. Also called *the structure of the psyche* that is governed by one's moral code. See also **ego, ego ideal, id.**

supereruption. See **overeruption.**

superfecundation /so͞o′pərfekəndā′shən/ [L, *super* + *fecundare,* to be fruitful], the impregnation of two or more ova released during the same ovulation by spermatozoa from successive coital acts.

superfetation /-fētā′shən/ [L, *super* + *fetus,* pregnancy], the fertilization of a second ovum after the onset of pregnancy, resulting in the simultaneous development of two fetuses of different degrees of maturity within the uterus. Also called **superimpregnation.**

superficial /-fish′əl/ [L, *superficies,* surface], **1.** pertaining to the surface. **2.** not grave or dangerous.

superficial abscess [L, *superficialis* + *abscedere,* to go away], an abscess that develops above the fascia layer.

superficial dorsal carpal ligament. See **extensor retinaculum of the hand.**

superficial fading infantile hemangioma, a superficial, temporary salmon-colored patch in the center of the forehead, face, or occiput of many newborns. It fades during the first 2 years of life, but it may temporarily deepen in color if the child becomes flushed or angry.

superficial fibular nerve, the nerve associated with the lateral compartment of the leg. It originates as one of the two major branches of the common fibular nerve. It innervates fibularis longus and fibularis brevis and then enters the foot where it divides into medial and lateral branches that supply dorsal areas of the foot and toes except for the web space between the great and second toes and the lateral side of the little toe.

superficial implantation, (in embryology) the partial embedding of the blastocyst within the uterine wall so that it and later the chorionic sac protrude into the uterine cavity. Also called **central implantation, circumferential implantation.**

superficial inguinal node, a node in one of the two groups of inguinal lymph glands in the upper femoral triangle of the thigh. The nodes form a chain distal to the inguinal ligament and receive afferent vessels from the skin of the penis, scrotum, perineum, buttocks, and abdominal wall below the level of the umbilicus. Compare **anterior tibial node, popliteal node.**

superficial nephron, a nephron whose proximal convoluted tubule is in the outer part of the renal cortex and whose loop of Henle goes only a short way into the renal medulla.

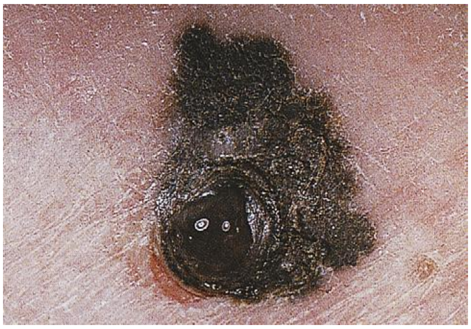
superficial penile fascia, subcutaneous tissue of penis. It is the loose external layer of fascial tissue of the penis.

superficial reflex, any neural reflex initiated by stimulation of the skin. Kinds of superficial reflexes are **abdominal reflex, anal reflex,** and **cremasteric reflex.** Compare **deep tendon reflex.**

superficial sensation, the awareness or perception of feelings in the superficial layers of the skin in response to touch, pressure, temperature, and pain. Such sensations are conveyed to the brain via the spinothalamic system. Compare **deep sensation.**

Superficial tactile sensation *(Seidel et al, 2011)*

superficial spreading melanoma, the most common melanoma that grows outward, spreading over the surface of the affected organ or tissue. It occurs most commonly on the lower legs of women and the torso of men. The lesion is raised and palpable, unevenly pigmented, and irregularly shaped and has an unclear border. See also **lentigo maligna melanoma, nodular melanoma.**



Superficial spreading melanoma *(du Vivier, 2002)*

superficial temporal artery, an artery at each side of the head that can be easily felt in front of the ear and is often used for taking the pulse. It is the smaller of the two terminal branches of the external carotid. Compare **deep temporal artery, middle temporal artery.**

superficial transverse perineal muscles, a pair of flat, band-shaped muscles that stabilize the perineal body.

superficial vein, one of the many veins between the subcutaneous fascia just under the skin. Compare **deep vein.**

superimpregnation. See **superfetation.**

superinfection /-infek′shən/ [L, *super* + *inficere,* to stain], an infection occurring during antimicrobial treatment for another infection. It is usually a result of change in the normal tissue flora favoring replication of some organisms by diminishing the vitality and then the number of competing organisms, as yeast microbes flourish during penicillin therapy prescribed to cure a bacterial infection.

superior /səpir′ē·ər/ [L, higher], situated above or oriented toward a higher place, as the head is superior to the torso. Compare **inferior.**

superior aperture of minor pelvis, an opening bounded by the crest and pecten of the pubic bones, the arch-shaped lines of the ilia, and the anterior margin of the base of the sacrum.

superior aperture of thorax, an elliptic opening at the summit of the thorax bounded by the first thoracic vertebra, the first ribs, and the upper margin of the sternum.

superior carotid triangle [L, *superior,* higher; Gk, *karos,* heavy sleep; L, *triangulus*], a triangle bounded by the sternocleidomastoid muscle, in front and below by the omohyoid muscle, and above by the stylohyoid and digastric muscles.

superior cervical ganglion, a very large ganglion in the area of the first and second cervical vertebrae that marks the superior extent of the trunk of the sympathetic nervous system.

superior conjunctival fornix, the space in the fold of the conjunctiva created by the reflection of the conjunctiva covering the eyeball and the lining of the upper lid. Compare **inferior conjunctival fornix.**

superior costotransverse ligament, one of five ligaments associated with each costotransverse joint, except that of the first rib. It passes from the neck of each rib to the transverse process of the vertebra immediately above and is associated with the intercostal vessels and the intercostal nerves. The first rib has no superior costotransverse ligament. Compare **posterior costotransverse ligament.**

superior gastric node, a node in one of two sets of gastric lymph glands, accompanying the left gastric artery. There are three groups of superior gastric nodes: the upper group of nodes on the stem of the artery, the lower group of nodes accompanying branches of the artery along the cardiac half of the lesser curvature of the stomach, and the paracardial group of nodes around the neck of the stomach. The superior gastric nodes receive their afferent vessels from the stomach and pass their efferent vessels to the celiac group of preaortic nodes. Compare **inferior gastric node.**

superior genial tubercle, superior mental spine. It is the upper part of a small bony projection located on the internal surface of the mandible, near the lower end of the midline and above the anterior end of the mylohyoid line, serving for attachment of the genioglossus muscle.

superior gluteal nerve, a nerve formed by branches of the sacral plexus that supplies muscles in the gluteal region.

superior hemorrhagic polioencephalitis. See **Wernicke's encephalopathy.**

superior kidney, superior segment of kidney. It is the renal segment located most superiorly.

superior mediastinum, the upper part of the mediastinum in the middle of the thorax, containing the trachea, the esophagus, the aortic arch, and the origins of the sternohyoideus and the sternothyroideus. Compare **anterior mediastinum, middle mediastinum, posterior mediastinum.**

superior mesenteric artery, a visceral branch of the abdominal aorta, arising inferior to the celiac artery, dividing into five branches, and supplying most of the small intestine and parts of the colon. The branches are the inferior pancreaticoduodenal, intestinal, ileocolic, right colic, and middle colic.

superior mesenteric node, a node in one of the three groups of visceral lymph nodes that serve the viscera of the abdomen and the pelvis. The superior mesenteric nodes are associated with branches of the superior mesenteric artery and include the mesenteric nodes, ileocolic nodes, and mesocolic nodes. Compare **gastric node, inferior mesenteric node.**

superior mesenteric vein, a tributary of the portal vein that drains the blood from the small intestine, the cecum, and the ascending and transverse colons. See also **portal vein.**

superior olivary nucleus [L, *supurus* + *oliva* + *nucleus,* nut kernel], a collection of nerve cells appearing as a clump of gray matter in the pons. The nucleus receives fibers from the cochlear nerve receptors on the same and opposite sides through the trapezoid body. It assists in the localization of sound by comparing the time difference between sounds received by the left and right ears.

superior orbital fissure, an elongated cleft between the small and great wings of the sphenoid bone, which transmits cranial nerves 3, 4, and 6 and the first division of cranial nerve 5 and the ophthalmic vein.

superior profunda artery. See **deep brachial artery.**

superior radioulnar joint. See **proximal radioulnar articulation.**

superior rectal plexus, the submucosal portion of the rectal venous plexus, above the pectinate line.

superior right lateral flexure of rectum, the second bend in the rectum, where it deviates laterally to the right.

superior sagittal sinus, one of the six venous channels in the posterior of the dura mater that drains blood from the brain into the internal jugular vein. It has no valves. The superior sagittal sinus receives the superior cerebral veins, veins from the diploë and near the posterior extremity of the sagittal suture, the anastomosing emissary veins from the pericranium, and the veins from the dura mater. It also anastomoses with veins of the nose, the scalp, and the diploë. Compare **inferior sagittal sinus, straight sinus, transverse sinus.**

superior subscapular nerve /səbskap′yələr/, one of a pair of small nerves on opposite sides of the body that arise from the posterior cord of the brachial plexus. It supplies the superior part of the subscapularis. Compare **inferior subscapular nerve.**

superior tarsal muscle, a collection of smooth muscle fibers in companion with the levator palpebrae superioris passing from the inferior surface of the lavatory to the upper edge of the superior tarsus. Loss of function of either the levator palpebrae superioris or the superior tarsal muscle results in a ptosis of the upper eyelid.

superior temporal gyrus, a rounded elevation on the lateral surface of either temporal lobe of the brain.

superior thoracic artery, a small artery that originates from the anterior surface of the first part of the axillary artery and supplies the upper regions of the medial and anterior axillary walls.

superior thyroid artery, one of a pair of arteries in the neck, usually arising from the external carotid artery, that supplies the thyroid gland and several muscles in the head.

superior ulnar collateral artery, a long slender division of the brachial artery, arising just distal to the middle of the arm, descending to the elbow, and anastomosing with the posterior ulnar recurrent and inferior ulnar collateral arteries.

superior vena cava, the second largest vein of the body, returning deoxygenated blood from the upper half of the body to the right atrium. It is about 2 cm in diameter and 7 cm long. The section of the superior vena cava closest to the heart composes about one half of the vessel's length and is within the pericardial sac, covered by the serous pericardium. It has no valves. Compare **inferior vena cava.**

superior vena cava syndrome, a condition of edema and engorgement of the veins of the upper body caused by obstruction of the superior vena cava by thrombi or primary pulmonary tumors. Signs and symptoms include a nonproductive cough, breathing difficulty, cyanosis, central nervous system disorders, and edema of the conjunctiva, trachea, and esophagus.

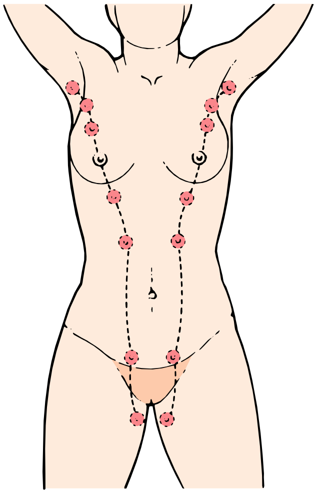
superior vesical artery, an artery that originates from the root of the umbilical artery and supplies the superior aspect of the bladder and distal parts of the ureter. In men, it may also give rise to an artery that supplies the ductus deferens.

supernatant /-nā′tənt/ [L, *super* + *natare,* to swim], **1.** *adj,* situated above or on top of something. **2.** *n,* the clear upper liquid part of a mixture (a liquid and a solid) after it has been centrifuged.

supernormal excitability /-nôr′məl/, the ability of the myocardium to respond at the end of phase 3 of the cardiac action potential to a stimulus that would be ineffective at other times.

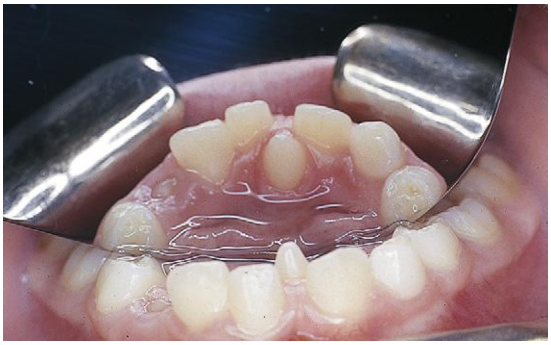
supernormal period, a period of supernormal excitability of the myocardium.

supernumerary nipples /-no͞o′mərer′ē/ [L, *super* + *numerus,* number; ME, *neb,* beak], an excessive number of nipples, which are usually not associated with underlying glandular tissue. They may vary in size from small pink dots to that of normal nipples.



Supernumerary nipples

supernumerary tooth [L, *super,* above, *numerus,* number; AS, *toth*], any tooth in addition to the normal 32 teeth in the secondary dentition or the 20 teeth in the primary dentition.



Supernumerary teeth *(Regezi, Sciubba, and Pogrel, 2000)*

superoxide /-ok′sīd/, a common reactive form of oxygen that is formed when molecular oxygen gains a single electron. Superoxide radicals can attack susceptible biological targets, including lipids, proteins, and nucleic acids.

superoxide dismutase (SOD), an enzyme composed of metal-containing proteins that converts superoxide radicals into less toxic agents. It is the main enzymatic mechanism for clearing superoxide radicals from the body.

supersaturate /-sach′ərāt/ [L, *super,* above, *saturare,* to fill], a solution that contains solute at a concentration greater than the solubility at a given temperature. Also called **metastable solution.**

supertwins, multiple births of more than two infants. Children of multiple births are more prone to premature birth and are likely to suffer from congenital defects, according to studies. The rate of cerebral palsy in multiple births is six times that for single births.

superversion. See **sursumversion.**

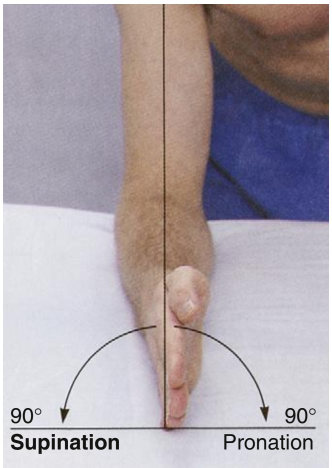
supervised fast /so͞o′pərvīzd/, a hypoglycemic diagnostic procedure in which glucose levels are measured every 4 to 6 hours in a fasting person until they fall below 50 mg/dL. The fasting person is closely observed, and glucose values are rapidly determined and reported by the laboratory.

supervision /-vizh′ən/, (in psychology) a process whereby a therapist is helped to become a more effective clinician through the direction of a supervisor who provides theoretic knowledge and therapeutic techniques and supports the working through of transference and countertransference reactions.

supervisor /so͞o′pərvī′zər/ [L, *super* + *videre,* to see], (in hospital or public health nursing) the midlevel management position between the chief nurse executive and nurse managers of a division or of several units. In many hospitals *clinical director* or *director* is the preferred term. The supervisor's responsibilities are primarily administrative, although they may include clinical leadership for the nurses working in a group of units, wards, or divisions.

supervitaminosis /-vī′təminō′sis/ [L, *super,* above, *vita* + *amine* + Gk, *osis,* condition], a condition of ingesting an excessive amount of vitamins in the forms of supplements. Signs and symptoms vary with specific vitamin excesses. See also **hypervitaminosis.**

supination /so͞o′pinā′shən/ [L, *supinus,* lying on the back], **1.** one of the kinds of rotation allowed by certain skeletal joints, such as the elbow and the wrist joints, which permit the palm of the hand to turn up. **2.** assumption of a supine position, one of lying on the back, face up. Compare **pronation.** —*supinate, v.*



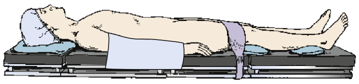
Supination and pronation *(Seidel et al, 2011)*

supinator jerk reflex. See **supinator longus reflex.**

supinator longus. See **brachioradialis.**

supinator longus reflex /so͞o′pinā′tər/ [L, *reflectere,* to bend back], a contraction of the brachioradialis muscle, causing flexion at the elbow joint, on tapping the point of insertion of the supinator longus muscle at the lower end of the radius. Also called **radial reflex, supinator jerk reflex.**

supine /səpīn′, so͞o′pīn/ [L, *supinus*], **1.** *n,* position of the arms or body in which the palms of the hands face upward. **2.** *adj,* lying horizontally on the back. Also called **dorsal decubitus position, dorsal recumbent.** Compare **prone.** See also **body position.**



Supine *(Phillips, 2007)*

supine hypotension, a fall in blood pressure that occurs when a pregnant woman is lying on her back. It is caused by impaired venous return that results from pressure of the gravid uterus on the vena cava. Also called **vena caval syndrome.**

supine position, the position of a person lying on the back. Also called **dorsal position.**

supplemental air. See **reserve capacity.**

supplemental inheritance /sup′ləmen′təl/ [L, *supplere,* to complete, *in,* in, *hereditare,* hereditary], the acquisition or expression of a genetic trait or condition through the presence of two independent pairs of nonallelic genes that interact in such a way that one gene supplements the action of the other.

supplementary gene /sup′ləmen′tərē/ [L, *supplere* + Gk, *genein,* to produce], one of two pairs of nonallelic genes that interact in such a way that one pair needs the presence of the other to be expressed, whereas the second pair can produce an effect independently of the first.

supply management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as ensuring acquisition and maintenance of appropriate items for providing patient care. See also **Nursing Interventions Classification.**

support /səpôrt′/ [L, *supportare,* to bring up], **1.** *v,* to sustain, hold up, or maintain in a desired position or condition, as in physically supporting the abdominal muscles with a scultetus binder or emotionally supporting a client under stress. **2.** *n,* the assistance given to this end, such as physical support, emotional support, or life support.

support group[1], **1.** an organization that serves as a link in the network for family caregivers and patients, such as those who are homebound, mentally ill, elderly, or suicidal or who have a specific disorder, such as multiple sclerosis. A support group helps families and patients find a balance of responsibility. The groups are supported by various national and local organizations. **2.** an organization for people who share a common problem. See also **social support groups.**

support group[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of a group environment to provide emotional support and health-related information for members. See also **Nursing Interventions Classification.**

supporting area [L, *supportare* + *area,* space], any of the areas of maxillary or mandibular edentulous ridges that are considered best suited to bear the forces of chewing with functioning dentures.

supporting cells, cells that provide support and protection and perhaps contribute to the nutrition of principal or other cells of certain organs. Such cells are found in the labyrinth of the inner ear, organ of Corti, olfactory epithelium, taste buds, and seminiferous tubules. Also called **sustentacular cells.**

supportive psychotherapy /səpôr′tiv/, a form of psychotherapy that concentrates on creating an effective means of communication with an emotionally disturbed person rather than on trying to produce psychological insight into the underlying conflicts. Through such supportive measures as reassurance, reinforcement of the person's defenses, direction, suggestion, and persuasion, the therapist participates directly in the solution of specific problems. Compare **nondirective therapy.**

supportive treatment. See **treatment.**

support system enhancement, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitation of support to the patient by family, friends, and community. See also **Nursing Interventions Classification.**

suppository /səpoz′ətôr′ē/ [L, *sub,* under, *ponere,* to place], an easily melted medicated mass for insertion into the rectum, urethra, or vagina. Theobroma oil, glycerinated gelatin, and high-molecular-weight polyethylene glycols are common vehicles for drugs in suppositories that are cone- or spindle-shaped for insertion into the rectum, globular or egg-shaped for use in the vagina, and pencil-shaped for insertion into the urethra. Drugs administered by rectal suppository are absorbed systemically, and this route is especially useful in babies, in uncooperative patients, and in cases of vomiting or certain digestive disorders.

suppressant /səpres′ənt/ [L, *supprimere,* to press down], an agent that suppresses or diminishes a physical or mental activity.

suppressed menstruation /səprest′/ [L, *supprimere,* to press down, *menstruare*], a failure of menstruation to occur when expected, as in amenorrhea, or menstruation that is suppressed, as with Gn Rit agonists. Also called **suppression of menses.**

suppression /səpresh′ən/ [L, *supprimere*], (in psychoanalysis) the conscious inhibition of or effort to conceal unacceptable or painful thoughts, desires, impulses, feelings, or acts. Compare **repression.**

suppression amblyopia, a partial loss of vision, usually in one eye, caused by cortical suppression of central vision to prevent diplopia. It occurs commonly in strabismus in the eye that deviates and does not fixate. Early recognition of strabismus and amblyopia is essential because occlusive therapy that forces use of the bad eye may dramatically improve the child's vision if begun early. It becomes progressively less effective with increasing age but may improve vision even up to 9 years of age. Without therapy, near-blindness in the affected eye may result, but common acuity loss is 20/40 to 20/400.

suppression of menses. See **suppressed menstruation.**

suppressor gene /səpres′ər/, a gene that is able to reverse the effect of a specific kind of mutation in other genes.

suppressor mutation, a mutation that partially or completely restores a function lost by a primary mutation occurring at a different locus.

suppressor T cell. See **T cell.**

suppurate /sup′yərāt/ [L, *suppurare,* to form pus], to produce purulent matter. **—suppuration,** *n.,* **suppurative,** *adj.*

suppuration /sup′yərā′shən/ [L, *suppurare,* to form pus], the production and exudation of pus.

suppurative /sup′yərā′tiv/ [L, *suppurare,* to form pus], pus-forming.

suppurative arthritis, inflammation of a joint with exudation of pus into the joint fluid.

suppurative fever [L, *suppurare,* to form pus, *febris,* fever], a fever accompanied by pus formation.

suppurative pancreatitis [L, *suppurare,* to form pus; Gk, *pan,* all, *kreas,* flesh, *itis,* inflammation], a form of pancreatic inflammation accompanied by the appearance of small abscesses.

suppurative phlebitis [L, *suppurare,* to form pus; Gk, *phleps,* vein, *itis,* inflammation], a vein inflammation that results from septicemia or a nearby pyogenic infection.

supra-, prefix meaning "above or over": *suprabuccal, supradural, suprarenalism.*

suprabony periodontal pocket. See **periodontal pocket.**

supracallosus gyrus /so͞o′prəkəlō′ses/ [L, *supra,* above, *callosus,* hard; Gk, *gyros,* turn], the gray matter covering the corpus callosum of the brain.

supracervical hysterectomy /-sur′vikəl/ [L, *supra,* above, *cervix,* neck; Gk, *hystera,* womb, *ektomē,* excision], a subtotal hysterectomy in which the body of the uterus is removed, leaving the cervix.

supraclavicular /-kləvik′yələr/ [L, *supra,* above, *clavicula,* little key], pertaining to the area above the clavicle, or collar bone.

supraclavicular artery, a branch of the thyrocervical trunk that supplies the muscles on the dorsal surface of the scapula.

supraclavicular nerve, one of a pair of cutaneous branches of the cervical plexus arising from the third and the fourth cervical nerves, mostly from the fourth nerve. The anterior group supplies the skin of the infraclavicular region, the middle group supplies the skin over the pectoralis major and the deltoideus, and the posterior group supplies the skin of the cranial and dorsal parts of the shoulder.

supraclavicular triangle [L, *supra,* above, *clavicula,* little key, *triangulus*], the lower and anterior areas of the neck, bounded by the omohyoid muscle above, the sternocleidomastoid muscle in front, and the clavicle below. The first rib is in the base of the triangle.

supraclusion. See **overeruption.**

supracondylar /-kon′dilər/ [L, *supra,* above; Gk, *kondylos,* knuckle], pertaining to an area above a condyle.

supracondylar fracture [L, *supra* + *kondylos,* knuckle], a fracture involving the area between the condyles of the humerus or the femur.

supracrestal periodontal pocket. See **periodontal pocket.**

supragingival calculus. See **calculus.**

supraglenoid tubercle, the site of attachment on the scapula of the biceps brachii muscle.

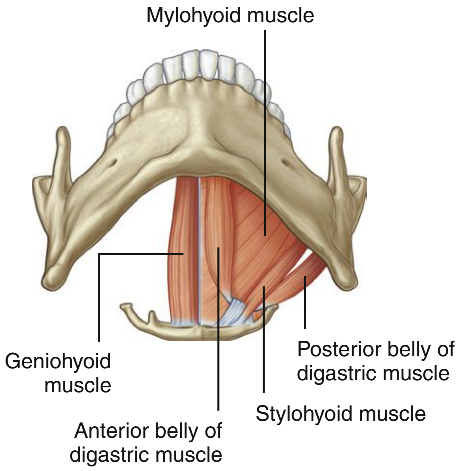
suprahyoid muscles, a group of four muscles that attach the hyoid bone to the skull. See also **digastricus, geniohyoideus, mylohyoideus, stylohyoideus.**

suprahyoid pharyngotomy, external pharyngotomy in which the suprahyoid muscles are divided and the epiglottic vallecula is entered by following the hyoepiglottic ligament.

suprainfection /-infek′shən/ [L, *supra* + *inficere,* to stain], a secondary infection usually caused by an opportunistic pathogen, such as a fungal infection after the antibiotic treatment of another infection or pneumonia in a patient debilitated by another illness.

supramentale /so͞o′prə·men·tā′lē/ [L, *supra,* above + *mentum,* chin], in radiographic cephalometry, the most posterior midline point in the concavity between the infradentale and pogonion, determined on the lateral head film.

supranasal /so͞o′prə·nā′zəl/ [L, *supra,* above + *nasus,* nose], superior to the nose.



Mylohyoid muscle
Geniohyoid muscle
Posterior belly of digastric muscle
Stylohyoid muscle
Anterior belly of digastric muscle

Suprahyoid muscles *(Drake, Vogl, and Mitchell, 2010)*

supranuclear gaze disturbance /-no͞o′klē·ər/, an inability to direct the eyes to the side contralateral to a lesion in the frontal lobe. If the frontal lobe lesions are bilateral, the patient can maintain fixation and follow visual targets but cannot shift the gaze in any direction in the absence of a target. See also **gaze palsy.**

supraocclusion. See **overeruption.**

supraoptic nucleus /-op′tik/ [L, *supra,* above; Gk, *optikos* + L, *nucleus,* nut kernel], a hypothalamic nucleus that lies above the optic chiasma, with fibers extending to the posterior lobe of the pituitary.

supraorbital /so͞o′prə·or′bi·təl/ [L, *supra,* above + *orbita,* wheel track], superior to the orbit.

supraorbital artery, a branch of the ophthalmic artery that supplies the scalp.

suprapatellar /-pətel′ər/ [L, *supra,* above, *patella,* small dish], pertaining to a location above the patella.

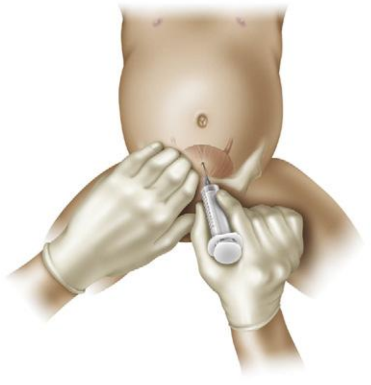
suprapatellar bursa, an expansion of the synovial membrane of the knee that is a continuation of the articular cavity superiorly between the distal end of the shaft of the femur and the quadriceps femoris muscle and tendon. It provides a low-friction surface for the movement of knee tendons. See also **subpopliteal recess.**

suprapelvic /so͞o′prə·pel′vik/ [L, *supra,* above + *pelvis,* basin], above the pelvis.

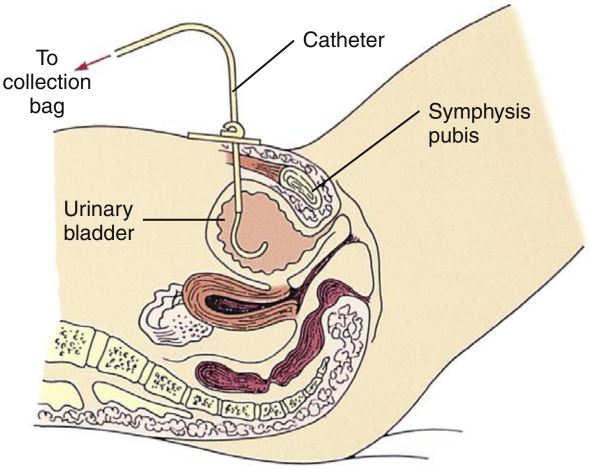
suprapubic /-p(y)o͞o′bik/ [L, *supra* + *pubes,* signs of maturity], pertaining to a location above the symphysis pubis.

suprapubic aspiration of urine, a procedure for draining the bladder by inserting a sterile needle through the skin above the pubic arch and into the bladder. The bladder may also be emptied by inserting a catheter through a suprapubic incision when conditions prohibit use of the conventional insertion. Also called **suprapubic puncture.**

suprapubic catheter [L, *supra* + *pubis* + Gk, *katheter,* a thing lowered into], a urinary bladder catheter inserted through the skin about 1 inch above the symphysis pubis. It is inserted under a general or local anesthetic. It is used for closed drainage and may be left in place for a time, sutured to the abdominal skin. Benefits include a lower incidence of urinary tract infection, ease of voiding naturally when the catheter is clamped, and ease of ambulation. Disadvantages are that they must initially be inserted through the abdominal wall by a physician and the insertion site must be cleaned daily using sterile technique if the patient is in the hospital.



Suprapubic aspiration of urine *(Custalow, 2005)*



Suprapubic catheter *(Elkin, Perry, and Potter, 2007)*

suprapubic lithotomy. See **high lithotomy.**

suprapubic puncture. See **suprapubic aspiration of urine.**

suprarenal /-rē′nəl/ [L, *supra* + *ren,* kidney], pertaining to a location above the kidney.

suprarenal gland. See **adrenal gland.**

suprascapular foramen, the route through which structures pass between the base of the neck and the posterior scapular region. It is formed by the suprascapular notch of the scapula and the superior transverse scapular ligament.

suprascapular ligament /-skap′yələr/ [L, *supra,* above, *scapula,* shoulder blade, *ligare,* to bind], a ligament that extends from the base of the coracoid process to the medial end of the suprascapular notch.

suprascapular nerve [L, *supra* + *scapulae,* shoulder blades], one of a pair of nerve branches from the cords of the brachial plexus. It supplies the shoulder joint, scapula, and associated muscles.

suprasellar /-sel′ər/, above the sella turcica.

suprasellar cyst. See **craniopharyngioma.**

supraspinal /-spī′nəl/ [L, *supra,* above, *spina,* backbone], pertaining to an area above the spine.

supraspinal ligament [L, *supra* + *spina,* backbone], the ligament that connects the apices of the spinous processes from the seventh cervical vertebra to the sacrum.

supraspinatus /so͞o′prə·spī·nā′tus/ [L, *supra,* above + *spina,* spine], a muscle originating in the supraspinous fossa and inserting in the greater tubercle of the humerus. It functions to abduct the humerus.

supraspinatus syndrome /-spīnā′təs/, pain and tenderness involving the supraspinatus tendon of the arm, restricting abduction of the shoulder.

supraspinous fossa /-spī′nəs/ [L, *supra,* above, *spina,* backbone, *fossa,* ditch], a depressed area on the dorsal surface of the scapula, above the spine.

suprasternal /-stur′nəl/, pertaining to a location above the sternum, adjacent to the neck.

suprasternal notch. See **jugular notch of the sternum.**

supratentorial /-tentôr′ē·əl/ [L, *supra,* above, *tentorium,* tent], pertaining to a location above a tentorium.

supratrochlear artery, one of the two terminal branches of the ophthalmic nerve, with the dorsal nasal artery.

supravaginal hysterectomy /-vaj′inəl/ [L, *supra,* above, *vagina,* sheath; Gk, *hystera,* womb, *ektomē,* excision], a subtotal hysterectomy in which the body of the uterus is removed but the cervix remains.

supraventricular crest, the muscular ridge on the interior dorsal wall of the right ventricle of the heart. It defines the limit of the arterial cone and extends toward the pulmonary trunk from the ventral cusp of the atrioventricular ring. Compare **moderator band.**

supraventricular tachycardia (SVT) /-ventrik′yələr/ [L, *supra* + *ventriculus,* little belly], any cardiac rhythm with a rate exceeding 100 beats/min that originates above the branching part of the atrioventricular (AV) bundle, that is, in the sinus node, atria, or AV junction.

supraversion /so͞o′prə·ver′zhən/ [L, *supra,* above + *vertere,* to turn], **1.** malocclusion in which a tooth or other maxillary or mandibular structure extends farther away from the alveolus than normal, the occluding surfaces of the teeth extending beyond the normal occlusal line. **2.** see **sursumversion.**

suprofen /səprō′fən/, an oral nonsteroidal antiinflammatory analgesic.

■ INDICATIONS: It is used in the treatment of mild to moderate pain and primary dysmenorrhea.

■ CONTRAINDICATIONS: It is contraindicated for patients who experience asthma, rhinitis, urticaria, or other allergic reactions from the use of aspirin or other nonsteroidal antiinflammatory drugs. It is not recommended for patients with a history of peptic ulcers or risk of other types of GI bleeding.

■ ADVERSE EFFECTS: Reported side effects include severe flank pain, nausea, vomiting, dyspepsia, abdominal pain, diarrhea, constipation, flatulence, headache, dizziness, sedation, and sleep disturbances.

sural communicating nerve. See **common fibular nerve.**

sural nerve, a nerve that originates high in the leg between the two heads of the gastrocnemius muscle and supplies skin on the lower posterolateral surface of the leg and the lateral side of the foot and little toe.

sural region /so͞o′rəl/ [L, *sura,* calf of the leg], the calf of the leg. It is formed by the bellies of the gastrocnemius and soleus muscles.

suramin sodium /so͞o′rəmin/, an antitrypanosomal and antifilarial available from the Centers for Disease Control and Prevention. It is used primarily for treatment and prophylaxis of African trypanosomiasis and onchocerciasis.

surcharge, (in the United States) an additional fee charged to health plan enrollees for benefits not provided in the health plan contract.

surface anatomy /sur′fəs/ [L, *superficies,* surface], the study of the structural relationships of the external features of the body to the internal organs and parts. Compare **cross-sectional anatomy.**

surface anesthesia. See **topical anesthesia.**

surface area (SA), the total area exposed to the outside environment. The surface area of an object increases with the square of its linear dimensions. Volume increases as the cube of the object's linear dimensions. Thus the larger of two objects of the same shape will have less surface area per unit volume than the smaller object. Most loss of body heat is from the body surface.

surface biopsy, the removal of living tissue for microscopic examination by scraping the surface of a lesion. It is done primarily to diagnose cancer of the uterine cervix. See also **exfoliative cytology, Papanicolaou's test.**

surface tension, the tendency of a liquid to minimize the area of its surface by contracting. This property causes liquids to rise in a capillary tube, affects the exchange of gases in the pulmonary alveoli, and alters the ability of various liquids to wet another surface.

surface therapy, a form of radiotherapy administered by placing one or more radioactive sources on or near an area of body surface. The resulting array of sources is called a surface mold, surface applicator, or plaque.

surface thermometer, a device that detects and indicates the surface temperature of any part of the body.

surfactant /sərfak′tənt/ [L, *superficies*], **1.** an agent, such as soap or detergent, dissolved in water to reduce its surface tension or the tension at the interface between the water and another liquid. **2.** also called **pulmonary surfactant.** one of certain lipoproteins that reduce the surface tension of pulmonary fluids, allowing the exchange of gases in the alveoli of the lungs and contributing to the elasticity of pulmonary tissue. See also **alveolus, atelectasis, surface tension.**

Surfak, a trademark for a stool softener (docusate calcium).

surfer's nodules [ME, *suffe,* rush; L, *nodus,* knot], nodules on the skin of the knees, ankles, feet, or toes of a surfer caused by repeated contact of the skin with an abrasive, sandy surfboard. The nodules slowly diminish in size and disappear if surfing is discontinued. When treatment is necessary, injection of corticosteroids is usually effective.

surgeon /sur′jən/, a physician who treats injuries, deformities, and diseases by operative methods.

surgeon general, (in the United States) the chief medical officer of the Army, Navy, Air Force, and Public Health Service. In other countries, the title may indicate any physician with the rank of general.

surgeon's assistant (SA) /sur′jənz/ [Gk, *cheirourgos,* surgeon; L, *assistere,* to cause to stand], a medical professional trained to assist during surgery and in the preoperative and postoperative periods under the supervision of a licensed physician qualified to practice surgery.

surgery /sur′jərē/ [Gk, *cheirourgia*], the branch of medicine concerned with diseases and trauma requiring operative procedures. **—surgical,** *adj.*

-surgery, suffix meaning the "treatment of illness or deformity": *cardiosurgery, chemosurgery, radiosurgery.*

surgical /sur′jikəl/ [Gk, *cheirourgia*], pertaining to the treatment of disease by manipulative and operative methods.

surgical abdomen. See **acute abdomen.**

surgical anatomy, (in applied anatomy) the study of the structure and morphological characteristics of the tissues and organs of the body as they relate to surgery.

surgical asepsis. See **asepsis.**

surgical assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the surgeon/dentist with operative procedures and care of the surgical patient. See also **Nursing Interventions Classification.**

Operating room for surgery
(Lewis et al, 2011/Courtesy Greg McVicar)

surgical assistant, as defined by the American College of Surgeons (ACS), the surgical assistant, under the direct supervision of the surgeon, provides aid in exposure, hemostasis, and other technical functions that will help the surgeon to perform a safe operation with optimal results for the patient. See also **Certified First Assistant.**

surgical diathermy. See **electrocoagulation.**

surgical fever [Gk, *cheirourgia* + L, *febris*], a fever that develops after surgery.

surgical field. See **operating field.**

surgical gut. See **catgut.**

surgical hospital, a hospital specializing in surgical procedures.

surgical induction of labor. See **induction of labor.**

surgical ligature, the exposure of an unerupted tooth by placing a metal ligature around its cervix. The free ends of the ligature are fixed to a fine precious-metal chain attached to an orthodontic appliance. These components act together to produce traction on the unerupted tooth and force it through the gingival tissues.

surgical menopause [Gk, *cheirourgia* + L, *men,* month; Gk, *pauein,* to cease], the creation of a menopausal state by surgical removal of the ovaries.

surgical microscope. See **operating microscope.**

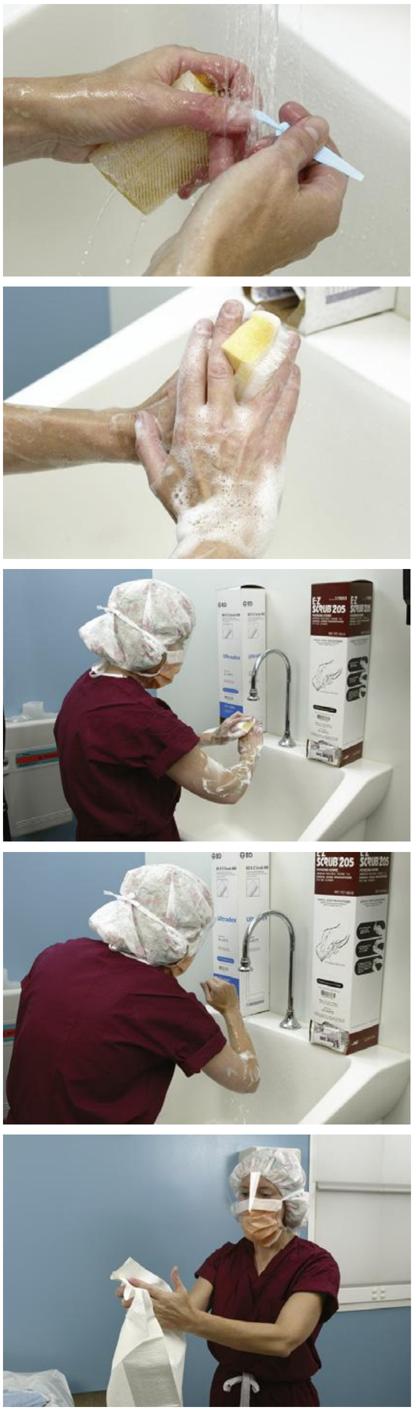
surgical neck of humerus [Gk, *cheirourgia* + AS, *hnecca* + L, *humerus,* shoulder], the shaft of the humerus distal to the tuberosities. It is a region particularly vulnerable to fracture and surgical correction.

surgical pathology, the study of disease by the analysis of tissue specimens obtained during surgery. The surgical pathologist often examines specimens during surgery to determine how the operation should be modified or completed. The appearance of the specimen is noted. Then, slices of the tissue are prepared by the paraffin or frozen section method and microscopically examined by a physician trained in pathology.

surgical precautions, a nursing intervention from the Nursing Interventions Classification (NIC) defined as minimizing the potential for iatrogenic injury to the patient related to a surgical procedure. See also **Nursing Interventions Classification.**

surgical preparation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing care to a patient immediately prior to surgery and verifying required procedures/tests and documentation in the clinical record. See also **Nursing Interventions Classification.**

surgical scrub, **1.** a bactericidal soap or solution used by surgeons and surgical nurses before performing or assisting in surgery. **2.** the act of washing the fingernails, hands, and forearms with a bactericidal soap or solution in a prescribed manner for a specific period before a surgical procedure.



Surgical scrub procedure *(Elkin, Perry, and Potter, 2007)*

surgical sectioning, an oral surgery procedure for dividing a tooth to facilitate its removal. A variety of instruments are used for surgical sectioning, including osteotomes and power-driven burs.

surgical shock [Gk, *cheirourgia* + Fr, *choc*], a condition of shock that may occur during or after surgery, with signs of profound hypotension, decreased urine, increased heart rate, restlessness, and cyanosis of the extremities. Hemoglobin for blood volume may be low, or patient may be bleeding or have a severe infection.

surgical suite, a group of one or more operating rooms and adjunct facilities, such as a sterile storage area, scrub room, and recovery room.

surgical technology, an allied health profession that focuses on providing an optimal surgical environment for the patient through the performance of sterile and nonsterile roles. See also **Certified Surgical Technologist.**

surgical treatment. See **treatment.**

Surmontil, a trademark for an antidepressant **(trimipramine maleate).**

surrogate /sur′əgāt/ [L, *surrogare,* to substitute], **1.** a substitute; a person or thing that replaces another. **2.** a person who represents and acts as a parent, taking the place of the father or mother. **3.** (in psychoanalysis) a substitute parental figure, a symbolic image or representation of another, as may occur in a dream. The identity of the person represented often remains in the unconscious.

surrogate parenting, a form of artificial insemination in which a fertile woman agrees to be impregnated by a sperm donor and to carry the child to term, at which time the offspring is surrendered to the care of another. The surrogate mother usually receives a fee for bearing the child.

surrogate partner. See **sex surrogate.**

sursum-, prefix meaning "upward": *sursumduction, sursumvergence, sursumversion.*

sursumversion /sur′sum·ver′zhən/ [L. *sursum* upward + *vertere,* to turn], binocular conjugate upward rotation of both eyes. Also called **superversion, supraversion.**

surveillance^{1} /sərvā′ləns/ [Fr, *surveiller,* to watch over], **1.** supervision or observation of a patient or a health condition. It may include the use of closed-circuit television cameras and monitors to cover unattended locations from a central office. **2.** a detailed examination or investigation for the accurate collection of data to record changes in the character of a population as at a particular time or, in a prospective or longitudinal surveillance, over a period. Retrospective surveillance might study the characteristics of a population in which a previous event occurred. The collection of data may include hospital records, morbidity and mortality statistics, death certificates, records of immunization, age groups, and various ecological and weather factors for the period of investigation, particularly if insect vectors are possible influences.

surveillance^{2}**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and ongoing acquisition, interpretation, and synthesis of patient data for clinical decision making. See also **Nursing Interventions Classification.**

surveillance: community, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and ongoing acquisition, interpretation, and synthesis of data for decision making in the community. See also **Nursing Interventions Classification.**

surveillance: late pregnancy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and ongoing acquisition, interpretation, and synthesis of maternal-fetal data for treatment, observation, or admission. See also **Nursing Interventions Classification.**

surveillance: remote electronic, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and ongoing acquisition of patient data via electronic modalities (telephone, video, conferencing, e-mail) from distant locations, as well as interpretation and synthesis of patient data for clinical decision making with individuals or populations. See also **Nursing Interventions Classification.**

surveillance: safety, a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and ongoing collection and analysis of information about the patient and the environment for use in promoting and maintaining patient safety. See also **Nursing Interventions Classification.**

surveyed height of contour /sərvād′/ [OFr, *surveir,* to survey; AS, *heah,* high; It, *contornare,* to surround], **1.** a line, scribed or marked on a plaster cast of the teeth by the use of a dental surveyor, that designates the greatest convexity relative to a selected path of denture placement and removal, as well as the placement of removable partial denture retention clasps. **2.** See **anatomical height of contour.**

surveyor, a dental instrument composed of a vertical post mounted to a flat metal base, a horizontal arm connected to the vertical post, followed by a vertical stylus which encases a piece of pencil lead. The second portion is a table to which a plaster cast of the teeth is clamped, so that a surveyed height of contour can be established.

survival curve /sərvī′vəl/ [Fr, *survivre,* to survive; L, *curvus,* bent], a plot of the number or percentage of organisms surviving for a given period as a function of radiation dose.

survivor guilt /sərvī′vər/ [OFr, *survivre* + ME, *gilt,* sin], feelings of guilt for surviving a tragedy in which others died. In some cases, the person may believe the tragedy occurred because he or she did something bad; in others, the person may feel guilty for not taking proper steps to avert the tragedy. Also called *survival guilt.*

susceptibility /səsep′tibil′itē/ [L, *suscipere,* to undertake], the condition of being vulnerable to a disease or disorder.

susceptible /səsep′tibəl/ [L, *suscipere,* to undertake], being predisposed, liable, or sensitive to the effects of an infectious disease, allergen, or other pathogenic agent; lacking immunity or resistance.

suspension /səspen′shən/ [L, *suspendere,* to hang], **1.** a liquid in which small particles of a solid are dispersed, but not dissolved, and in which the dispersal is maintained by stirring or shaking the mixture. If left standing, the solid particles settle at the bottom of the container. See also **colloid, solution. 2.** a treatment, used primarily in spinal disorders, consisting of suspending the patient by the chin and shoulders. **3.** a temporary cessation of pain or of a vital process.

suspension sling, a sling usually made of muslin or lightweight canvas and used primarily to provide support, such as against the gravitational pull on an injured arm. An example is a common triangular sling.

suspensory ligament /səspen′sərē/ [L, *suspendere,* to hang, *ligare,* to bind], any of a number of ligaments that help support an organ or body structure, such as the suspensory ligaments inside the eye that hold the lens in tension.

suspensory ligament of the lens. See **zonula ciliaris.**

sustained release. See **prolonged release.**

sustenance /sus′tənəns/ [L, *sustenare,* to sustain], **1.** the act or process of supporting or maintaining life or health. **2.** the food or nutrients essential for maintaining life.

sustenance support, a nursing intervention from the Nursing Interventions Classification (NIC) defined as helping an individual/family in need to locate food, clothing, or shelter. See also **Nursing Interventions Classification.**

sustentacular /sus′ten·tak′yo͞o·lər/ [L, *sustentare,* to support], pertaining to a support or serving to support.

sustentacular cells. See **supporting cells.**

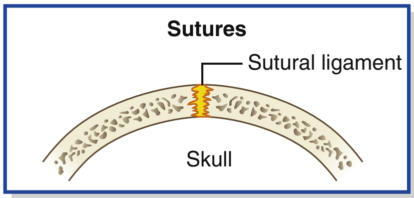
sustentaculum tali, a process of the calcaneus that supports the talus.

susto /so͞os′tō/, a culture-bound syndrome found in Central American populations related to stress engendered by a self-perceived failure to fulfill sex-role expectations.

Sutent, a trademark for **sunitinib.**

Sutton's disease /sut′ənz/ [Richard Lightburn Sutton, American dermatologist, 1878–1952], a recurrent disease of the mucous membranes of unknown cause, generally considered to be a severe form of aphthous stomatitis, characterized by deep crater-like ulcers with inflamed borders that leave scars after healing. It usually involves the mucosa of the lips, cheeks, tongue, palate, and anterior tonsillar pillars, but the pharynx, larynx, and genitalia may also be affected. Also called **Mikulicz's aphthae, periadenitis mucosa necrotica recurrens, recurring scarring aphthae.** See also **aphthous stomatitis.**

sutura /so͞ocho͞o′rə/ *pl.* **suturae** [L, suture], an immovable fibrous joint in which certain bones of the skull are connected by a thin layer of fibrous tissue. Compare **gomphosis, syndesmosis.**



Sutura *(Drake, Vogl, and Mitchell, 2010)*

sutura dentata, an immovable fibrous joint that is one kind of true suture in which toothlike processes interlock along the margins of connecting bones of the skull. Compare **sutura limbosa, sutura serrata.**

suturae, an immovable joint. See **sutura.**

suturae cranii. See **cranial sutures.**

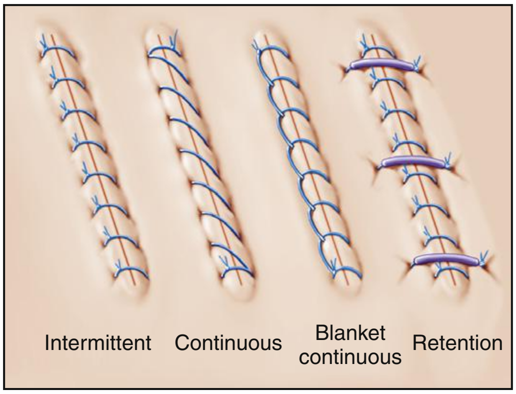
sutura limbosa, an immovable fibrous joint that is one kind of true suture in which beveled and serrated edges of certain connecting bones of the skull, such as the parietal and temporal bones, overlap and interlock. Compare **sutura dentata, sutura serrata.**

sutura plana, a fibrous joint that is one kind of false suture in which rough contiguous edges of certain bones of the skull, such as the maxillae, form a connection. Compare **sutura squamosa.**

sutura serrata, an immovable fibrous joint that is one kind of true suture in which connecting bones interlock along serrated edges that resemble fine-toothed saws. Compare **sutura dentata, sutura limbosa.**

sutura squamosa, an immovable fibrous joint that is one kind of false suture in which overlapping beveled edges unite certain bones of the skull, such as the temporal and the parietal bone. Compare **sutura plana.**

suture /so͞o′chər/ [L, *sutura*], **1.** *n,* a border or a joint, such as between the bones of the cranium. **2.** *v,* to stitch together cut or torn edges of tissue with suture material. **3.** *n,* a surgical stitch taken to repair an incision, tear, or wound. **4.** *n,* material used for surgical stitches, such as absorbable or nonabsorbable silk, catgut, wire, or synthetic material.



Types of sutures *(Harkreader, Hogan, and Thobaben, 2007)*

suture forceps. See **needle holder.**

suturing, a nursing intervention from the Nursing Interventions Classification (NIC) defined as approximating edges of a wound by using sterile suture material and a needle. See also **Nursing Interventions Classification.**

Sv, abbreviation for **sievert.**

SV40, abbreviation for **simian virus 40.**

SV40 papovavirus. See **papovavirus.**

SvO_2, symbol for the percentage of oxygen saturation of mixed venous blood.

SVR, abbreviation for **systemic vascular resistance.**

SVT, abbreviation for **supraventricular tachycardia.**

swab /swob/ [D, *swabber,* ship's drudge], a stick or clamp holding absorbent gauze or cotton, used for washing, cleansing, or drying a body surface; for collecting a specimen for laboratory examination; or for applying a topical medication.

swaddling /swod′ling/ [OE, *swethel,* swaddling band], **1.** long narrow bands of cloth once used to wrap a newborn. **2.** a method of wrapping a newborn, especially a premature or at-risk newborn, that provides maximal comfort and containment.

swage /swāj/ [OFr, *souage*], **1.** *v,* to shape metal by hammering or by adapting it to a die. **2.** *v,* to fuse suture material to a needle, especially an eyeless needle. **3.** *n,* a tool or form, often one of a pair, for shaping metal by pressure.

Swain, Mary Ann P. See **Modeling and Role Modeling.**

swallow apnea, absence of respiration during the phase of swallowing when the bolus is passing through the oropharyngeal region.

swallowing /swol′ō·ing/ [AS, *swelgan*], the process that usually involves movement of food from the mouth to the stomach via the esophagus. Coordination of muscles is needed from the tongue to the esophageal sphincter. See also **swallowing reflex.**

swallowing examination, an x-ray with contrast dye (usually barium) that is performed to pinpoint problems that exist in a patient who is unable to swallow. The examination is used to detect tumors; upper esophageal diverticula; inflammation; extrinsic compression of the upper GI tract; problems resulting from surgery to the oropharyngeal tract; motility disorders of the upper GI tract; and neurological disorders such as stroke, Parkinson's disease, and neuropathies.

swallowing reflex [AS, *swelgan* + L, *reflectere,* to bend back], a sequence of reflexes that begins when a bolus of food is manipulated by the tongue and other oral cavity muscles to the palate or the pharynx.

swallowing status, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the safe passage of fluids and/or solids from the mouth to the stomach. See also **Nursing Outcomes Classification.**

swallowing status: esophageal phase, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as safe passage of fluids and/or solids from the pharynx to the stomach. See also **Nursing Outcomes Classification.**

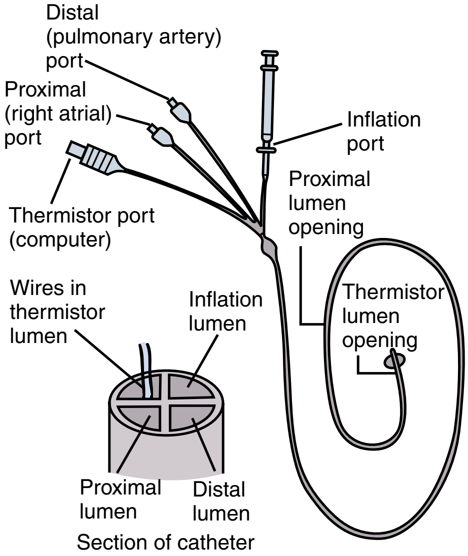
swallowing status: oral phase, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as preparation, containment, and posterior movement of fluids and/or solids in the mouth. See also **Nursing Outcomes Classification.**

swallowing status: pharyngeal phase, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as safe passage of fluids and/or solids from the mouth to the esophagus. See also **Nursing Outcomes Classification.**

swallowing therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating swallowing and preventing complications of impaired swallowing. See also **Nursing Interventions Classification.**

swamp fever. See **leptospirosis, malaria.**

Swan-Ganz catheter /swän′ ganz′/ [Harold J.C. Swan, American physician, b. 1922; William Ganz, American cardiologist, b. 1919; Gk, *katheter,* something lowered], a long, thin cardiac catheter with a tiny balloon at the tip. It is used to determine left ventricular function by measuring pulmonary capillary wedge pressure.



Swan-Ganz catheter *(Black and Hawks, 2009)*

swan neck deformity /swän/ [D, *zwaan* + AS, *hnecca,* neck; L, *deformis,* misshapen], **1.** also called **zig-zag.** an abnormal condition of the finger characterized by flexion of the distal interphalangeal joint and hyperextension of the proximal interphalangeal joint. It is caused by a taut profundus tendon in the presence of a weakened distal interphalangeal joint and may be combined with a volar plate rupture. The condition is seen most often in rheumatoid arthritis. **2.** a structural abnormality of the kidney tubules associated with rickets. The kidney tubule connecting the glomerulus with the convoluted part of the tubule is narrowed into a configuration referred to as "swan neck." There are also a thinning and atrophy of the distal tubule and a shortening of the convoluted part.

Swanson, Kristen M., a nursing theorist whose Theory of Caring asserts that nursing care is nurturing delivered as a set of interrelated processes that evolve from the nurse's own convictions and knowledge and his or her interaction with the patient. The theory is based on Swanson's Caring Model, which names as the components of caring five basic processes—knowing, being with, doing for, enabling, and maintaining belief (faith in and esteem for the patient). The theory's objective is to help nurses deliver care that promotes the dignity, respect, and empowerment.

Swanson's Caring Model. See **Swanson, Kristen M.**

S wave, the negative component after the R wave in each QRS complex on an electrocardiogram.

sway, to rock, teeter, wobble, or swing back and forth.

sweat. See **perspiration.**

sweat bath, a bath given to induce sweating.

sweat duct. See **sudoriferous duct.**

sweat electrolytes test, a fluid analysis of sweat to indicate whether a patient has cystic fibrosis.

sweat gland. See **sudoriferous gland.**

sweat gland abscess, an abscess in a sweat gland, such as in hidradenitis suppurativa.

sweating. See **diaphoresis.**

sweat test, a method for evaluating sodium and chloride excretion from the sweat glands, often the first test performed in the diagnosis of cystic fibrosis. The sweat glands are stimulated with a drug such as pilocarpine, and the perspiration produced is analyzed. The eccrine glands of patients with cystic fibrosis produce sodium and chloride concentrations that are three to six times normal. Chloride levels above 60 mEq/L and sodium levels above 90 mEq/L are considered diagnostic for the disease. The test is very reliable, and although it may be useful at any age, it is usually performed on infants from 2 weeks to 1 year of age. See also **cystic fibrosis.**

Swedish massage /swē′dish/ [Fr, *masser*], the most commonly used form of classical Western massage, generally performed in the direction of the heart, sometimes with active or passive movement of the joints. It is used especially for relaxation, relief of muscular tension, and improvement of circulation and range of motion.

sweep tapping, a proprioceptive-tactile treatment technique in which the clinician uses a light-touch sweep pattern over the back of the fingers of one of the hands. The stimulus is applied quickly over a dermatomal area, helping the patient to contract the muscle.

Sweet localization method, a radiographic technique for locating a foreign body in the eye by making two radiographic films of the eye while the patient's head is immobilized. A small metal ball and a cone are placed at precise distances from the center of the cornea as register marks while lateral and perpendicular radiographic views of the eye are made. A three-dimensional view of the eye is constructed from the two films, and, guided by the positions of the ball and cone, the location of the foreign body in the eye is plotted from the intersection of lines through the ball and cone.

Sweet's syndrome /swēts/ [Robert Douglas Sweet, English dermatologist, 20th century], a condition usually seen on the upper body of middle-aged women, characterized by one or more large, rapidly extending, erythematous, tender or painful plaques, accompanied by fever and dense infiltration of neutrophils in the upper and middle dermis. Also called **acute febrile neutrophilic dermatosis.**

Swift's disease. See **acrodynia.**

swimmer's ear [AS, *swimman,* to swim, *eare*], *(informal)* otitis externa resulting from infection transmitted in the water of a swimming pool. See also **otitis externa.**

swimmer's itch, an allergic dermatitis caused by sensitivity to nonhuman schistosome cercarias that die under the skin, leading to erythema, urticaria, and a papular rash lasting 1 or 2 days. Treatment usually includes oral antihistamines and antipruritic lotions. Also called **schistosome dermatitis.** See also **schistosomiasis.**

swimming reflex, a primitive fetal activity, marked by well-coordinated movements, that is exhibited when the infant's face is placed in water. It normally disappears at 6 months of age.

swineherd's disease, leptospirosis, manifested as a benign meningitis, caused by serovariants of *Leptospira interrogans*. It affects people who work with swine or pork or come in contact with the urine of animal or human carriers.

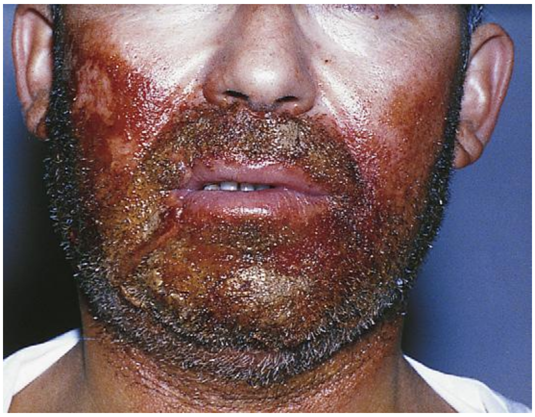
swing phase of gait [AS, *swingan* + Gk, *phasis,* appearance; ME, *gata,* a way], the phase of the normal gait cycle during which the foot is off the ground. The swing phase follows the stance phase and is divided into the initial swing, the midswing, and the terminal swing stages.

switch site, a point on a chromosome where gene segments unite during segment rearrangement, as in the production of immunoglobulins.

swoon [OE, *geswogen,* unconscious], a fainting spell.

sy-. See **syn-.**

sycosis barbae /sikō′sis/ [Gk, *sycon,* fig, *osis,* condition; L, *barba,* beard], an inflammation of hair follicles of skin that has been shaved. Treatment includes light and infrequent shaving, topical and systemic antibiotics, and daily plucking of infected hairs. Also called **barber's itch, sycosis vulgaris.**



Sycosis barbae *(du Vivier, 2002)*

Sydenham's chorea /sīd′ənhamz/ [Thomas Sydenham, English physician, 1624–1689; Gk, *choreia,* dance], a form of chorea associated with rheumatic fever, usually occurring during childhood. The cause is unknown but is thought be a streptococcal infection that initiates an autoimmune mechanism. The choreic movements increase over the first 2 weeks, reach a plateau, and then diminish. The child usually recovers within 10 weeks. With undue exertion or emotional strain, the condition may recur. Also called **chorea minor, rheumatic chorea.**

syl-. See **syn-.**

sylvatic plague /silvat′ik/ [L, *sylva,* forest, *plaga,* stroke], an endemic disease of wild rodents caused by *Yersinia pestis* and transmitted to humans by the bite of an infected flea. Infection of humans by wild animals is described as a sylvatic stage. It is found on every continent except Australia. See also **bubonic plague.**

sylvian aqueduct /sil′vē·ən/ [Franciscus Sylvius, Dutch anatomist, 1614–1672, L, *aquaductus,* canal], a narrow canal from the third to the fourth ventricle of the midbrain. Also called **Sylvius' aqueduct.**

sylvian fissure [Franciscus Sylvius; L, *fissura,* cleft], the lateral sulcus of the cerebral hemisphere. Also called **sylvian sulcus.**

Sylvius' aqueduct. See **sylvian aqueduct.**

sym-. See **syn-.**

symbiosis /sim′bē·ō′sis/ [Gk, *syn,* together, *bios,* life], **1.** a mode of living characterized by a close association between organisms of different species. **2.** a state in which two people are emotionally dependent on each other. **3.** a pathological inability of a child to separate from its mother emotionally and sometimes physically. **—symbiotic,** *adj*.

symbiotic /sim′bē·ot′ik/ [Gk, *syn,* together, *bios,* life], characterized by or concerned with symbiosis or living together.

symbiotic phase, in Mahler's system of preoedipal development, the stage between 1 and 5 months when the infant participates in a "symbiotic orbit" with the mother. All parts of the mother, including voice, gestures, clothing, and space in which she moves, are joined with the infant.

symblepharon, adhesion of the eyelid to the cornea. Also called **corneoblepharon.**

symbol /sim′bəl/ [Gk, *symbolon,* sign], **1.** an image, object, action, or other stimulus that represents something else by reason of conscious association, convention, or another relationship, such as a flag or a statue. **2.** an object, mode of behavior, or feeling that disguises a repressed emotional conflict through an unconscious association rather than through an objective relationship, as in dreams and anxiety.

-symbolia, suffix meaning "(condition involving) the ability to interpret symbols": *asymbolia, dyssymbolia, strephosymbolia*.

symbolism /sim′bəlizəm/, **1.** the representation or evocation of one idea, action, or object by the use of another, as in systems of writing, poetic language, or dream metaphor. **2.** (in psychiatry) an unconscious mental mechanism characteristic of all human thinking in which a mental image stands for but disguises some other object, person, or thought, especially one associated with emotional conflict. The mechanism is a principal factor in the formation of dreams and in various symptoms resulting from such anxious and psychotic conditions as conversion reactions, obsessions, and compulsions. Also called **symbolization.**

symelus. See **symmelus.**

Symlin, a trademark for **pramlintide.**

symmelia /simē′lyə/ [Gk, *syn,* together, *melos,* limb], a developmental anomaly characterized by apparent fusion of the lower limbs. There may be three feet **(tripodial symmelia),** two feet **(dipodial symmelia),** one foot **(monopodial symmelia),** or no feet **(sirenomelia).** See also **symmelus, sympus.**

symmelus /sim′ələs/, a malformed fetus characterized by symmelia. Also spelled **symelus.**

Symmers' disease. See **giant follicular lymphoma.**

Symmetrel, a trademark for an antiviral and antiparkinsonian **(amantadine hydrochloride).**

symmetric /simet′rik/ [Gk, *syn* + *metron,* measure], (of the body or parts of the body) pertaining to equality in size or shape. It is very similar in relative placement or arrangement about an axis. Also called *symmetrical*. Compare **asymmetric. —symmetry,** *n.*

symmetric lipomatosis. See **nodular circumscribed lipomatosis.**

symmetric orientation, (in neonatal care) midline positioning of the head with similar alignment of the trunk and extremities. The orientation helps promote even development of tone and function in both sides of the body.

symmetric tonic neck reflex, a normal response in infants to assume the crawl position by extending the arms and bending the knees when the head and neck are extended. The reflex disappears when neurological and muscular development allows independent limb movement for actual crawling. Also called **crawling reflex.** See also **tonic neck reflex.**

symmetry /sim′ətrē/ [Gk, *syn,* together, *metron,* measure], (in anatomy) the correspondence of parts on opposite sides of the body, or equality of parts on both sides of a dividing line.

sympathectomize /sim′pəthek′təmiz/ [Gk, *sympathein,* to feel with, *ektomē,* excision], to interrupt the conduction of nerve impulses along part of the sympathetic trunk by surgery or drugs.

sympathectomy /sim′pəthek′təmē/ [Gk, *sympathein,* to feel with, *ektomē,* excision], a surgical interruption of part of the sympathetic nerve pathways to relieve chronic pain or to promote vasodilation in vascular diseases, such as arteriosclerosis, claudication, Buerger's disease, and Raynaud's phenomenon. The sheath around an artery carries the sympathetic nerve fibers that control constriction of the vessel. Removal of the sheath causes the vessel to relax and expand and allows more blood to pass through it. The operation also may be done with a vascular graft to increase the blood flow through the graft area. Preoperatively the physician may assess the effect of surgery by injecting sympathetic ganglia with a local anesthesia to interrupt temporarily the sympathetic nerve impulses. The nerves lie along the spinal column and are approached through the back or the neck, by using local anesthesia. Postoperatively, the adequacy of circulation and peripheral nervous supply in the affected extremity is monitored. An arteriogram shows a widened pathway.

sympathetic /sim′pəthet′ik/ [Gk, *sympathein,* to feel with], **1.** displaying of compassion for another's grief. **2.** pertaining to a division of the autonomic nervous system. **3.** See **sympathy.**

sympathetic eye. See **sympathizing eye.**

sympathetic ganglion [Gk, *sympathein,* to feel with, *ganglion,* knot], a collection of multipolar nerve cells along the course of the sympathetic trunk. Nearly two dozen of the ganglia serve as "cell stations" on efferent pathways between the cervical and sacral parts of the sympathetic trunk.

sympathetic imbalance [Gk, *sympathein,* to feel with; L, *in + balance*], pertaining to vagotony, or vagus nerve tension and hyperexcitability of the parasympathetic nervous system, as opposed to the sympathetic nervous system. Also called **vagotonia.**

sympathetic irritation [Gk, *sympathein,* to feel with; L, *irritare,* to tease], inflammation of one organ after inflammation of a related organ, such as when trauma to an eye is followed by similar symptoms in the uninjured eye.

sympathetic nerve [Gk, *sympathein,* to feel with; L, *nervus*], any nerve of the sympathetic branch of the autonomic nervous system.

sympathetic nervous system. See **autonomic nervous system.**

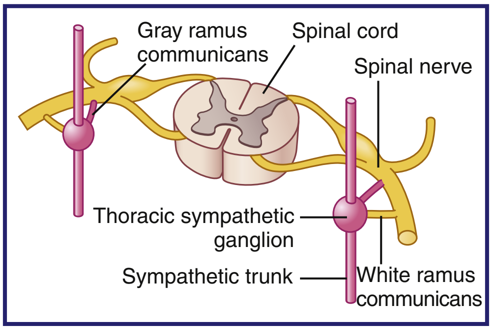
sympathetic ophthalmia, a granulomatous inflammation of the uveal tract of both eyes occurring after an injury to the uveal tract of one eye. Corticosteroids may be helpful in treatment, but surgical enucleation of the originally injured eye may be necessary to preserve vision in the uninjured eye. Also called **metastatic ophthalmia, migratory ophthalmia.**

sympathetic pain, distress that occurs in the hemiplegic shoulder with a loss of joint range, as a result of muscle imbalance. It results from loss of active and passive motion, loss of ability to bear weight, and long-standing subluxation without support.

sympathetic stress reaction. See **alarm reaction.**

sympathetic symptom [Gk, *sympathein,* to feel with, *symptoma,* that which occurs], a symptom occurring in one body area when the causative lesion is actually in another area. See also **referred pain.**

sympathetic trunk, one of a pair of chains of ganglia extending along the side of the vertebral column from the base of the skull to the coccyx. Each trunk is part of the sympathetic nervous system and consists of a series of ganglia connected by various types of fibers. Each sympathetic trunk distributes branches with postganglionic fibers to the autonomic plexuses, the cranial nerves, the individual organs, the nerves accompanying arteries, and the spinal nerves.



Sympathetic trunk *(Drake, Vogl, and Mitchell, 2010)*

sympathize. See **sympathy.**

sympathizing eye /sim′pəthī′zing/, (in sympathetic ophthalmia) the fellow eye that becomes inflamed by lymphatic or blood-borne metastasis of the causative antigen or microorganism. Also called **sympathetic eye.**

sympatholytic, sympatholytic agent. See **antiadrenergic.**

sympathomimetic /sim′pəthō′mimet′ik/ [Gk, *sympathein + mimesis,* imitation], a pharmacological agent that mimics the effects of stimulation of organs and structures by the sympathetic nervous system. It functions by occupying adrenergic receptor sites and acting as an agonist or by increasing the release of the neurotransmitter norepinephrine at postganglionic nerve endings. Various sympathomimetic agents are used as decongestants of nasal and ocular mucosa, such as bronchodilators in the treatment of asthma and vasopressors and cardiac stimulants in the treatment of acute hypotension and shock; they are also used for maintaining normal blood pressure during operations using spinal anesthesia. Drugs in this group include cyclopentamine, DOBUTamine, DOPamine, epHEDrine, isoproterenol, metaproterenol, metaraminol, mephentermine, methoxamine, methoxyphenamine, naphazoline, norepinephrine, phenylephrine, propylhexedrine, protokylol, pseudoephedrine, terbutaline sulfate, tetrahydrozoline, tuaminoheptane, xylometazoline, and epINEPHrine, a synthetic isomer of the hormone secreted by the adrenal medulla. Adverse effects of sympathomimetic drugs may be nervousness, severe headache, anxiety, vertigo, nausea, vomiting, dilated pupils, glycosuria, and dysuria. Also called **adrenergic drug.**

sympathomimetic amine, an amine that mimics the actions of the sympathetic nervous system. The group includes the catecholamines and drugs that mimic their actions. See also **adrenergic.**

sympathomimetic bronchodilator, a medication that reduces bronchial muscle spasm through action that mimics the sympathetic nervous system in producing smooth muscle relaxation. It is commonly a beta$_2$ receptor agonist agent.

sympathy /sim′pəthē/ [Gk, *sympathein*], **1.** an expressed interest or concern regarding the problems, emotions, or states of mind of another. Compare **empathy. 2.** the relation that exists between the mind and body, causing the one to be affected by the other. **3.** mental contagion or the influence exerted by one individual or group on another and the effects produced, such as the spread of panic, uncontrollable laughter, or yawning. **4.** the physiological or pathological relationship between two organs, systems, or parts of the body. **—sympathetic,** *adj*., **sympathize,** *v*.

symphalangia /sim′fəlan′jē·ə/ [Gk, *syn*, together, *phalanx*, finger], **1.** a condition, usually inherited, characterized by ankylosis of the fingers or toes. **2.** a congenital anomaly in which webbing of the fingers or toes occurs in varying degrees, often in conjunction with other defects of the hands or feet. Also called *symphalangism*. See also **syndactyly.**

symphocephalus /sim′fōsef′ələs/ [Gk, *symphes*, growing together, *kephale*, head], twin fetuses joined at the head. The term is often used as a general designation for fetuses with varying degrees of the anomaly. See also **craniopagus, syncephalus.**

Symphonological Bioethical Theory. See **Husted, Gladys L. and James H.**

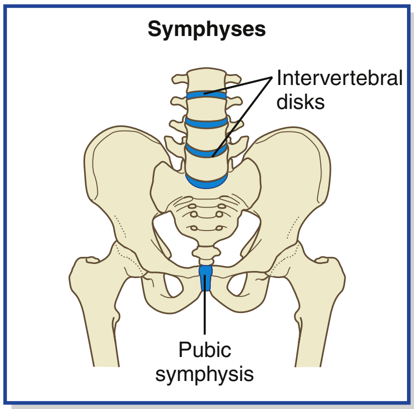
Symphonological Model for Ethical Decision Making. See **Husted, Gladys L. and James H.**

symphyseal angle /simfiz′ē·əl/ [Gk, *symphysis*, growing together; L, *angulus*, corner], the angle of the chin, which may be classified as protruding, straight, or receding.

symphyses, symphysic. See **symphysis.**

symphysic teratism /simfiz′ik/, a congenital anomaly in which there is a fusion of normally separated parts or organs, such as a horseshoe kidney, or in which parts close prematurely, such as the skull bones in craniostenosis.

symphysis /sim′fəsis/ *pl*. **symphyses** [Gk, growing together], **1.** also called **fibrocartilaginous joint.** A line of union, especially a cartilaginous joint in which adjacent bony surfaces are firmly united by fibrocartilage. **2.** *(informal)* symphysis pubis. **—***symphysic, adj*.



Symphysis *(Drake, Vogl, and Mitchell, 2010)*

symphysis menti, **1.** the junction between the two halves of the mandible. **2.** the prominence of the chin.

symphysis pubis. See **pubic symphysis.**

sympodia /simpō′dē·ə/ [Gk, *syn*, together, *pous*, foot], a congenital developmental anomaly characterized by fusion of the lower extremities. See also **sirenomelus, sympus.**

symptom /simp′təm/ [Gk, *symptoma*, that which happens], a subjective indication of a disease or a change in condition as perceived by the patient. For example, the halo symptom of glaucoma is seen by the patient as colored rings around a single light source. Many symptoms are accompanied by objective signs, such as pruritus, which is often reported with erythema and a maculopapular eruption on the skin. Some symptoms may be objectively confirmed, such as numbness of a body part, which may be confirmed by absence of response to a pin prick. **Primary symptoms** are symptoms that are intrinsically associated with a disease. **Secondary symptoms** are a consequence of illness and disease. Compare **sign.**

symptomatic /simp′təmat′ik/ [Gk, *symptoma*, that which happens], having characteristics of a symptom or indications of a specific disease.

symptomatic esophageal peristalsis, a condition in which peristaltic progression in the body of the esophagus is normal but contractions in the distal esophagus are increased in amplitude and duration. Also called **esophageal peristalsis, nutcracker esophagus.**

symptomatic impotence [Gk, *symptoma*, that which happens; L, *in* + *potentia*, power], impotence that is the result of poor health or the use of medications.

symptomatic nanism, dwarfism associated with defects in bone growth, tooth formation, and sexual development.

symptomatic neuralgia [Gk, *symptoma*, that which happens, *neuron*, nerve, *algos*, pain], nerve pain that is secondary to a disease condition.

symptomatic torticollis [Gk, *symptoma* + L, *tortus*, twisted, *collum*, neck], stiff neck caused by a disease in the neck, such as rheumatoid torticollis or myogenic torticollis.

symptomatic treatment. See **treatment.**

symptomatology /simp′təmətol′əjē/ [Gk, *symptoma* + *logos*, science], the science of symptoms of disease in general or of the symptoms of a specific disease.

symptom-bearer, (in psychology) a family member frequently perceived as a patient who is functioning poorly because family dynamics interferes with functioning at a higher level. Also known as the *identified patient*.

symptom complex. See **syndrome.**

symptom control, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to minimize perceived adverse changes in physical and emotional functioning. See also **Nursing Outcomes Classification.**

symptomless carrier. See **passive carrier.**

symptom severity, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of perceived adverse changes in physical, emotional, and social functioning. See also **Nursing Outcomes Classification.**

symptom severity: perimenopause, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of symptoms caused by declining hormonal levels. See also **Nursing Outcomes Classification.**

symptom severity: premenstrual syndrome (PMS), a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the severity of symptoms caused by cyclic hormonal fluctuations. See also **Nursing Outcomes Classification.**

symptothermal method of family planning /simp′təthur′məl/ [Gk, *symptoma* + *therme*, heat], a natural method of family planning that incorporates the ovulation and basal body temperature methods of family planning. It is more effective than either method used alone and requires fewer days of abstinence from sexual intercourse because it allows the fertile period of the menstrual cycle to be more precisely identified.

sympus /sim′pəs/ [Gk, *syn,* together, *pous,* foot], a malformed fetus in which the lower extremities are completely fused or rotated and the pelvis and genitalia are defective. Kinds of sympuses are **sirenomelus, sympus dipus,** and **sympus monopus.** See also **symmelus.**

sympus apus. See **sirenomelus.**

sympus dipus /dē′pəs/, a malformed fetus in which the lower extremities are fused and both feet are formed.

sympus monopus /mon′əpəs/, a malformed fetus in which the lower extremities are fused and one foot is formed. Also called **monopodial symmelia, uromelus.**

syn-, sy-, syl-, sym-, prefix meaning "union, or association": *synalgia, syncephalus, synchronous.*

synactive model of infant behavior /sinak′tiv/, a major theoretic framework for establishing physiological stability as the foundation for the organization of motor, behavioral state, and attentive and interactive behaviors in neonates.

synadelphus /sin′ədel′fəs/ *pl. synadelphi* [Gk, *syn* + *adelphos,* brother], a conjoined twin with a single head and trunk and eight limbs. Also called **cephalothoracoiliopagus, syndelphus.**

Synalar, a trademark for a glucocorticoid **(fluocinolone acetonide).**

synapse /sin′aps, sinaps′/ [Gk, *synaptein,* to join], **1.** *n,* the region surrounding the point of contact between two neurons or between a neuron and an effector organ, across which nerve impulses are transmitted through the action of a neurotransmitter, such as acetylcholine or norepinephrine. When an impulse reaches the terminal point of one neuron, it causes the release of the neurotransmitter. The neurotransmitter diffuses across the gap between the two cells to bind with receptors in the other neuron, muscle, or gland, triggering electric changes that either inhibit or continue the transmission of the impulse. Synapses are polarized so that nerve impulses normally travel in only one direction; they are also subject to fatigue, oxygen deficiency, anesthetics, and other chemical agents. Kinds of synapses include **axoaxonic synapse, axodendritic synapse, axodendrosomatic synapse, axosomatic synapse,** and **dendrodendritic synapse.** Compare **ephapse. 2.** *v,* to form a synapse or connection between neurons. **3.** *v,* (in genetics) to form a synaptic fusion between homologous chromosomes during meiosis. **—synaptic,** *adj.*

synapsis /sinap′sis/, *pl. synapses,* the pairing of homologous chromosomes during early meiotic prophase in gametogenesis to form double or bivalent chromosomes.

synaptic /sinap′tik/ [Gk, *synaptein,* to join], pertaining to or resembling a synapse.

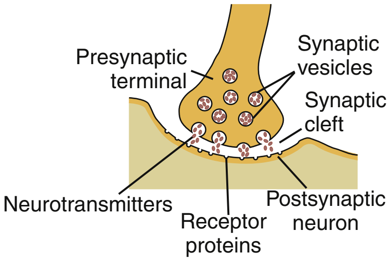
synaptic cleft, the microscopic extracellular space at the synapse that separates the membrane of the terminal nerve endings of a presynaptic neuron and the membrane of a postsynaptic cell. Nerve impulses are transmitted across this cleft by means of a neurotransmitter. Also called **synaptic gap.** See also **neuromuscular junction.**

synaptic junction, the membranes of both the presynaptic neuron and the postsynaptic receptor cell together with the synaptic cleft. See also **synapse.**

synaptic transmission, the passage of a neural impulse across a synapse from one nerve fiber to another by means of a neurotransmitter. Compare **ephaptic transmission.**

synaptogenesis /sinap′tōjen′əsis/, the formation of synapses between neurons. In humans it begins early in gestation but occurs most rapidly from 2 months before birth to 2 years after birth.

synaptosome /sinap′təsōm′/, a presynaptic nerve terminal that has been separated from the rest of the neuron and isolated from homogenates of brain tissue. It appears as a membrane-bound structure containing synaptic vesicles.



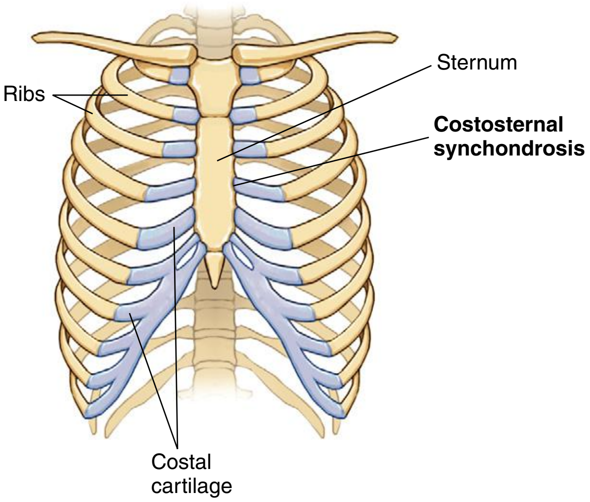
Synaptic transmission *(Black and Hawks, 2009)*

synarthrosis, any of several immovable articulations. See also **fibrous joint.**

syncephalus /sinsef′ələs/ [Gk, *syn* + *kephale,* head], a conjoined twin having a single head and two bodies. Also called **monocephalus.**

synchilia /singkē′lyə/ [Gk, *syn* + *cheilos,* lip], a congenital anomaly in which there is complete or partial fusion of the lips; atresia of the mouth. Also spelled *syncheilia.*

synchondrosis /sing′kondrō′sis/ *pl. synchondroses* [Gk, *syn* + *chondros,* cartilage], a cartilaginous joint creating a union between two immovable bones, such as the synchondroses of the cranium, the pubic symphysis, the sternum, and the manubrium.



Synchondroses *(Patton and Thibodeau, 2010)*

synchorial /singkôr′ē·əl/ [Gk, *syn* + *chorion,* skin], pertaining to multiple fetuses that share a common placenta, as in monozygosity.

synchronized intermittent mandatory ventilation (SIMV) /sing′krənīzd/, periodic assisted mechanical ventilation synchronized with the patient's breathing. Spontaneous breathing by the patient occurs between the assisted mechanical breaths, which occur at preset intervals. The ventilator will provide a mechanical breath if the patient fails to do so within the set interval.

synchronous /sing′krənəs/, occurring at the same time.

synclitism /sing′klitiz′əm/ [Gk, *syn* + *klinein,* to lean], **1.** (in obstetrics) a condition in which the sagittal suture of the fetal head is in line with the transverse diameter of the inlet, equidistant from the maternal symphysis pubis and sacrum. This position is usually found on examination either late in pregnancy or early in labor, as the fetal head descends into the pelvic inlet. As labor progresses, posterior asynclitism develops, and, as the head descends farther, anterior asynclitism is evident because of the shape of the true pelvis below the inlet. **2.** (in hematology) the normal condition in which the nucleus and the cytoplasm of the blood cells mature simultaneously and at the same rate.

syncope /sing′kəpē/ [Gk, *synkoptein,* to cut short], a brief lapse in consciousness caused by transient cerebral hypoxia. It is usually preceded by a sensation of light-headedness and often may be prevented by lying down or by sitting with the head between the knees. It may be caused by many different factors, including emotional stress, vagal stimulation, vascular pooling in the legs, diaphoresis, and a sudden change in environmental temperature or body position. Also called **fainting.**

syncretic thinking /singkret′ik/ [Gk, *synkretismos,* combined beliefs; AS, *thencan,* to think], a stage in the development of the cognitive thought processes of the child during which thought is based purely on what is perceived and experienced. The child is incapable of reasoning beyond the observable or of making deductions or generalizations. Through imaginative play, questioning, interaction with others, and the increasing use of language and symbols to represent objects, the child begins to learn to make associations between ideas and to elaborate concepts. In Piaget's classification, this stage occurs between 2 and 7 years of age and is preceded by the sensorimotor stage of development, when the child progresses from reflex activity to repetitive and imitative behavior. Compare **abstract thinking, concrete thinking.** **—***syncresis, n.*

syncytia. See **syncytium.**

syncytial /sinsish′əl/, pertaining to a syncytium.

syncytial-trophoblast. See **syncytiotrophoblast.**

syncytial virus, a virus that induces the formation of syncytia, particularly in cell cultures.

syncytiotrophoblast /sinsish′ē·ōtrof′əblast′/ [Gk, *syn* + *kytos,* cell, *trophe,* nutrition, *blastos,* germ], the outer syncytial layer of the trophoblast of an early mammalian embryo. It erodes the uterine wall during implantation and gives rise to the villi of the placenta. Also called **plasmidotrophoblast, syncytial trophoblast, syntrophoblast.** Compare **cytotrophoblast.** **—***syncytiotrophoblastic, adj.*

syncytium /sinsit′ē·əm/ *pl.* **syncytia** [Gk, *syn* + *kytos,* cell], a group of cells in which the cytoplasm of one cell is continuous with that of adjoining cells, resulting in a multinucleate unit. **—syncytial,** *adj.*

syndactyl, syndactylia, syndactylism, syndactylous. See **syndactyly.**

syndactylus /sindak′tiləs/, a person with webbed fingers or toes.

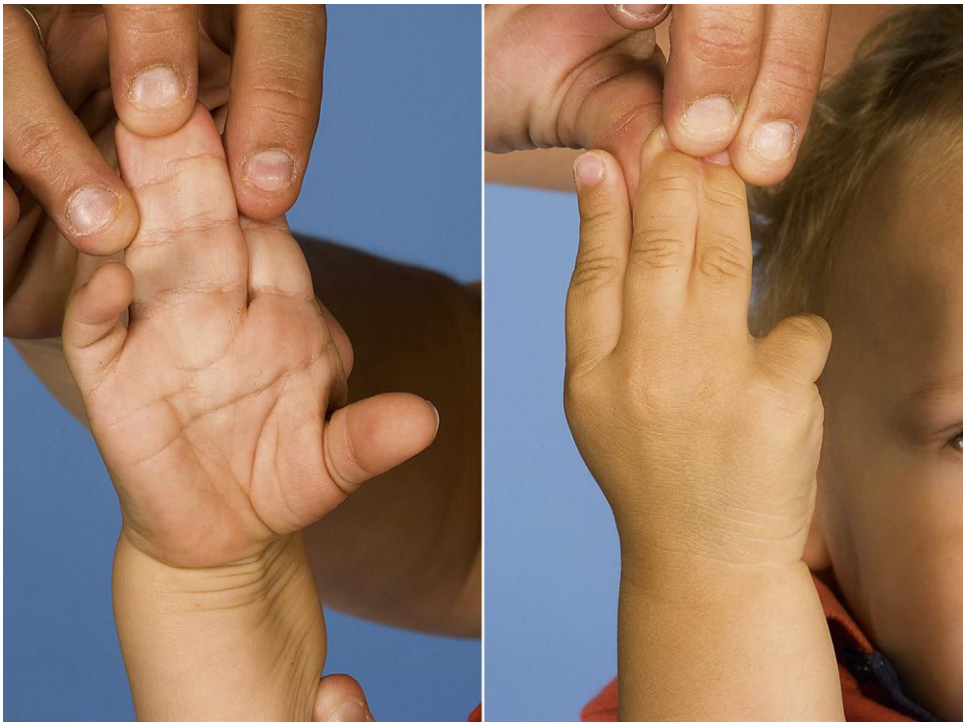
syndactyly /sindak′təlē/ [Gk, *syn* + *daktylos,* finger], a congenital anomaly characterized by the fusion of the fingers or toes. It varies in degree of severity from incomplete webbing of the skin of two digits to complete union of digits and fusion of the bones and nails. Also called **syndactylia, syndactylism.** **—syndactyl, syndactylous,** *adj.*

syndelphus. See **synadelphus.**

syndemosis, a joint in which two adjacent bones are linked by a ligament, such as the linking of the radius and ulna by an interosseus membrane.

syndesis /sin′dəsis/ [Gk, *syn,* together, *dein,* to bind], surgical fixation of a joint. Also called **arthrodesis.**

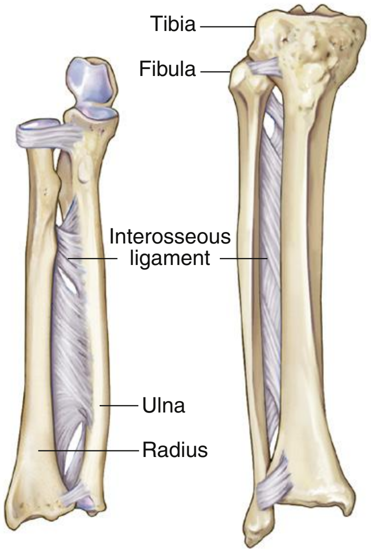
syndesmo-, prefix meaning "connective tissue or particularly the ligaments": *syndesmochorial, syndesmography, syndesmoma.*



Mild syndactyly of the fingers
(James and O'Neill, 2007)

syndesmophyte /sindez′məfīt/, a bony growth attached to a ligament. It is found between adjacent vertebrae in ankylosing spondylitis.

syndesmosis /sin′desmō′sis/ *pl.* syndesmoses [Gk, *syndesmos,* ligament], a fibrous union in which two bones are connected by interosseous ligaments, such as the anterior and the posterior ligaments in the radioulnar and tibiofibular articulations. Compare **gomphosis, sutura.**



Syndesmosis *(Patton and Thibodeau, 2010)*

syndrome /sin′drəm/ [Gk, *syn,* together, *dromos,* course], a complex of signs and symptoms resulting from a common cause or appearing, in combination, to present a clinical picture of a disease or inherited abnormality. See also specific syndromes. Also called **symptom complex.**

syndrome of inappropriate antidiuretic hormone secretion (SIADH), an abnormal condition characterized by the excessive release of antidiuretic hormone (ADH) that alters the body's fluid and electrolytic balances. It results in various malfunctions, such as the inability to produce and secrete dilute urine, water retention, increased extracellular fluid volume, and hyponatremia. SIADH develops in association with diseases that affect the osmoreceptors of the hypothalamus. Oat cell carcinoma of the lung is the most common cause, affecting about 80% of involved patients. Other causes are disorders that affect the central nervous system, such as brain tumors and lupus erythematosus; pulmonary diseases, such as pneumonia; cancers of the pancreas and the prostate; and pathological reactions to various drugs, such as chlorproPAMIDE, vinCRIStine sulfate, carbamazepine, and clofibrate. Prognosis depends on the underlying disease, promptness of diagnosis and treatment, and the response to treatment.

■ OBSERVATIONS: Common signs and symptoms of SIADH are weight gain despite anorexia, vomiting, nausea, muscle weakness, and irritability. In some patients, SIADH may produce coma and convulsions. Most of the free water associated with this syndrome is intracellular, and associated edema is rare unless excess water volume exceeds 4 mOsm. Confirming diagnosis is based on urine osmolality that exceeds 150 mOsm/kg of water and serum osmolality of less than 280 mOsm/kg of water. Normal urine osmolality is 1.5 times serum osmolality. Other significant results include less than normal concentrations of blood urea nitrogen, serum creatinine, and albumin and a concentration of sodium in the urine higher than normal.

■ INTERVENTIONS: Treatment of SIADH commonly includes restriction of water intake and may require administration of normal saline solution to raise the serum sodium level if water intoxication is severe. Furosemide may be administered to block circulatory overload, and drugs, such as demeclocycline hydrochloride and lithium, may be administered to block renal response to ADH. Surgery and chemotherapy are other alternatives to remove or destroy neoplasms that may be the underlying causes of this syndrome.

■ NURSING CONSIDERATIONS: The SIADH patient is monitored for any signs of hyponatremia, weight change, and fluid imbalance. The patient is carefully advised on the importance of restricted water intake to prevent water intoxication and is closely observed for any indications of restlessness, congestive heart failure, and convulsions.

syndrome X, a condition characterized by hypertension with obesity, type 2 diabetes mellitus, hypertriglyceridemia, increased peripheral insulin resistance, hyperinsulinemia, and elevated catecholamine levels.

synechia /sinek′ē·ə/ *pl.* synechiae [Gk, continuity], an adhesion, especially of the iris to the cornea or lens of the eye. It may develop from glaucoma, cataracts, uveitis, or keratitis or as a complication of surgery or trauma to the eye. Synechiae may prevent or impede flow of aqueous fluid between the anterior and posterior chambers of the eye, resulting in angle closure glaucoma.

synechiotomy /sinek′ē·ot′əmē/ [Gk, *synechia,* continuity, *temnein,* to cut], the surgical division of an adhesion.

syneresis /siner′əsis/ [Gk, *syn* + *hairein,* to draw], the drawing together or coagulation of particles of a gel with separation from the medium in which the particles were suspended, such as occurs in blood clot retraction.

synergic. See **synergistic.**

synergism. See **synergy.**

synergist /sin′ərjist/ [Gk, *syn* + *ergein,* to work], an organ, agent, or substance that augments the activity of another organ, agent, or substance.

synergistic /sin′ərjis′tik/ [Gk, *syn,* together, *ergein,* to work], pertaining to the acting or working together of a number of components, as when groups of muscles function in a coordinated manner. Also **synergic** /sinūr'jik/.

synergistic agent, a substance that augments or adds to the activity of another substance or agent. See also **synergy,** def. 4.

synergistic muscles, groups of muscles that contract together to accomplish the same body movement.

synergy /sin′ərjē/ [Gk, *syn* + *ergein,* to work], **1.** the process in which two organs, substances, or agents work simultaneously to enhance the function and effect of one another. **2.** the coordinated action of a set of muscles that work together to produce a specific movement, as in a reflex action. **3.** a combined action of different parts of the autonomic nervous system, as in the sympathetic and parasympathetic innervation of secreting cells of the salivary glands, with both systems having a secretory effect. **4.** the interaction of two or more drugs to produce a certain effect, as in the exaggerated response to tyramine in a person who is treated with a monoamine oxidase inhibitor. Also called **synergism.**

synesthesia /sin′esthē′zhə/, a phenomenon in which sensations of two or more modalities accompany one another, as when a visual sensation is experienced when a particular sound is heard. Also called **secondary sensation.**

syngeneic /sin′jənē′ik/ [Gk, *syn* + *genesis,* origin], **1.** denoting an individual or cell that has the same genotype as another individual or cell. **2.** denoting tissues that are antigenically similar. Also called **isogeneic.** Compare **allogenic, xenogeneic.**

syngenesis. See **sexual reproduction.**

synkinesis /sin′kinē′sis/ [Gk, *syn,* together, *kinesis,* movement], an involuntary movement by one part of the body when an intentional movement is made by another part. In imitative synkinesis, movement may be detected in paralyzed muscles when normal muscles are moved, and vice versa.

synophthalmia. See **cyclopia.**

Synophylate GG, trademark for a bronchodilator (theophylline sodium glycinate).

synopsis /sinop′sis/ [Gk, *syn,* together, *opsis,* vision], a brief review, condensation, summary, or abridgment.

synostosis /sin′ostō′sis/ [Gk, *syn,* together, *osteon,* bone], the joining of two bones by the ossification of connecting tissues. It occurs normally in the fusion of cranial bones to form the skull.

synostotic joint /sin′ostot′ik/ [Gk, *syn* + *osteon,* bone], a joint in which bones are connected to bones, with no movement between them, as in the bones of the adult sacrum or skull.

synotia /sīnō′shə/ [Gk, *syn* + *ous,* ear], a congenital malformation characterized by the union or approximation of the ears in front of the neck, often accompanied by the absence or defective development of the lower jaw. Compare **agnathia.** See also **otocephaly.**

synotus /sīnō′təs/, a fetus with synotia.

synovectomy /sin′ōvek′təmē/ [Gk, *syn* + L, *ovum,* egg; Gk, *ektomē,* excision], the removal of a synovial membrane of a joint.

synovia /sinō′vē·ə/, a clear, viscous fluid resembling the white of an egg, secreted by synovial membranes and acting as a lubricant for many joints, bursae, and tendons. It contains mucin, albumin, fat, and mineral salts. Also called **synovial fluid.**

synovial /sinō′vē·əl/, pertaining to, consisting of, or secreting synovia, the lubricating fluid of the joints, bursae, and tendon sheaths.

synovial bursa, one of the many closed sacs filled with synovial fluid in the connective tissue between the muscles, the tendons, the ligaments, and the bones. The synovial bursae facilitate the gliding of muscles and tendons over bony and ligamentous prominences. Compare **synovial membrane, synovial tendon sheath.**

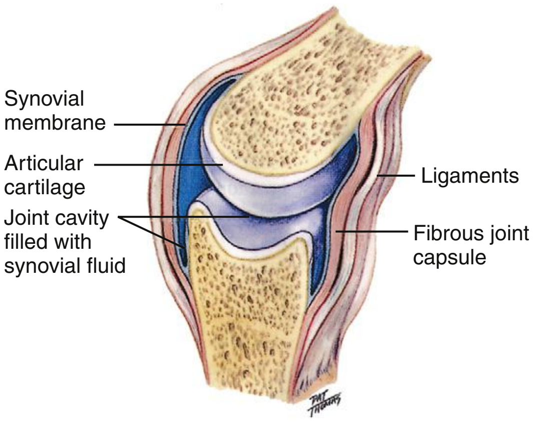
synovial chondroma, a rare cartilaginous growth in the connective tissue below the synovial membrane of the joints, tendon sheaths, or bursa. Foci on the surface may develop stalks and then detach, resulting in numerous loose bodies within the joint. Also called **synovial chondromatosis.**

synovial crypt, a pouch in the synovial membrane of a joint.

synovial fluid. See **synovia.**

synovial joint, a freely movable joint in which contiguous bony surfaces are covered by articular cartilage and connected by a fibrous connective tissue capsule lined with synovial membrane. Kinds of synovial joints are **ball and socket joint, condyloid joint, gliding joint, hinge joint, pivot joint, saddle joint,** and **uniaxial joint.** Compare **cartilaginous joint, fibrous joint.**

synovial membrane, the thin layer of tissue lining the articular capsule surrounding a freely movable joint. The synovial membrane is loosely attached to the external fibrous capsule. It secretes into the joint a thick fluid that normally lubricates the joint but that may accumulate in painful amounts when the joint is injured. Compare **synovial bursa, synovial tendon sheath.**



Synovial joint *(Applegate, 2011)*

synovialoma /s-no′ve-ah-lo′mah/, a synovial tumor, involving a tendon sheath or joint.

synovial sac, a herniation of a synovial membrane beyond the confines of a joint.

synovial sarcoma, a malignant tumor, composed of synovioblasts, that begins as a soft swelling and often metastasizes through the bloodstream to the lung before it is discovered.

synovial sheath, any one of the membranous sacs enclosing a tendon of a muscle and facilitating the gliding of a tendon through a fibrous or a bony tunnel, such as that under the flexor retinaculum of the wrist.

synovial tendon sheath, one of the many membranous channels or tubes enclosing various tendons that glide through fibrous and bony tunnels in the body, such as those under the flexor retinaculum of the wrist. One layer of the synovial sheath lines the tunnel, and the other covers the tendon. The sheath secretes synovial fluid, which lubricates the tendon. Compare **synovial bursa, synovial membrane.**

synovitis /sin′əvī′tis/, an inflammatory condition of the synovial membrane of a joint as the result of an aseptic wound or a traumatic injury, such as a sprain or severe strain. The knee is most commonly affected. Fluid accumulates around the capsule; the joint is swollen, tender, and painful; and motion is restricted. In most cases, the inflammation subsides and the fluid is resorbed without medical or surgical intervention.

synovium /sinō′vē·əm/, a synovial membrane.

synpolydactyly /sin-pol′e-dak′tile/. See **polysyndactyly.**

syntactic aphasia /sintak′tik/ [Gk, *syn,* together, *taxis,* arrangement, *a, phasis,* not speech], an inability to arrange words in a logical sequence, with the result that what is spoken is not understood.

syntax /sin′taks/ [Gk, *syn* + *taxis,* arrangement], word order; sentence order; a property of language involving structural cues for the arrangement of words as elements in a phrase, clause, or sentence.

syntaxic mode /sintaks′ik/, the ability to perceive whole, logical, coherent pictures as they occur in reality, according to the H.S. Sullivan theory of psychology.

synteny /sin′tənē/ [Gk, *syn* + *taina,* ribbon], (in genetics) the presence on the same chromosome of two or more genes that may or may not be transmitted as a linkage group but that appear to be able to undergo independent assortment during meiosis. The term is used primarily in human genetics, in which linked inheritance patterns are more difficult to determine. See also **linkage.**

synthermal /sinthur′məl/, possessing the same temperature.

synthesis /sin′thəsis/ [Gk, *synthenai,* to put together], a level of cognitive learning in which the individual puts together the elements of previous learning levels to create a unified whole.

-synthesis, suffix meaning “putting together or formation of”: *narcosynthesis, psychosynthesis, velosynthesis.*

synthesize /sin′thəsīz/ [Gk, *synthesis,* putting together], to form by building, as in the formation of complex chemical compounds such as proteins from simpler units of amino acids.

synthetic /sinthet′ik/, pertaining to a substance that is produced by an artificial rather than a natural process or material.

synthetic chemistry, the science dealing with the formation of more complex chemical compounds from simpler substances.

synthetic human growth hormone, a synthetic form of somatotropin produced by recombinant deoxyribonucleic acid techniques from a strain of ***Escherichia coli*** bacteria. The polypeptide hormone consists of 191 amino acid residues in a sequence identical to that of natural human growth hormone.

synthetic insulin [Gk, *synthesis,* putting together; L, *insula,* island], a form of insulin synthesized in a non-disease–producing strain of *Escherichia coli* bacteria or in yeast cells that have been genetically altered by the addition of the human gene for insulin production.

synthetic oleovitamin D. See **viosterol.**

synthetic saliva. See **artificial saliva.**

synthetic vaccines, prophylactic immunization substances prepared by artificial techniques, such as by peptide synthesis or cloning of deoxyribonucleic acid.

Synthroid, a trademark for a thyroid hormone **(levothyroxine sodium).**

Syntocinon, a trademark for an oxytocic **(oxytocin).**

syntrophism /sin′trəfiz′əm/, **1.** mutual dependence for food or other resources. **2.** a condition in which two strains of bacteria can grow together in a mixed culture in a medium that would not support either alone. Each strain produces a nutrient required by the other.

syntrophoblast. See **syncytiotrophoblast.**

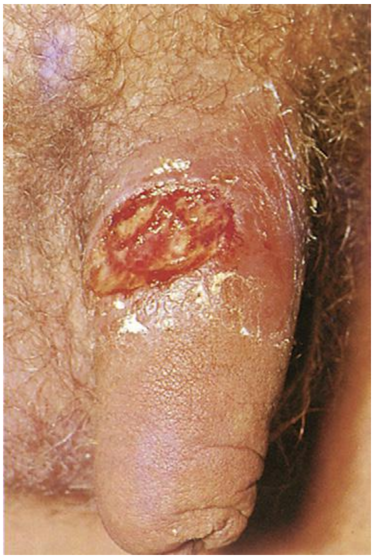
syntropy /sin′trəpē/ [Gk, *syn,* together, *trepein,* to turn], a tendency for two diseases to merge into one.

syphilis /sif′ilis/ [from the name of a literary figure (1530) who was thus infected (literally, L, lover of swine)], a sexually transmitted disease caused by the spirochete ***Treponema pallidum,*** characterized by distinct stages of effects over a period of years. Any organ system may become involved. The spirochete is able to pass through the human placenta, producing congenital syphilis. Also called **lues.** See also **chancre, gumma, Hutchinson’s teeth, Hutchinson’s triad, snuffles. —syphilitic,** *adj.*

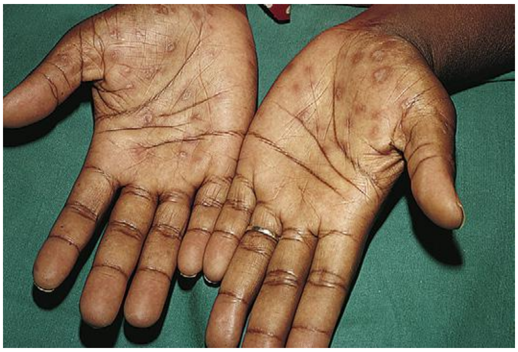
■ OBSERVATIONS: The first stage **(primary syphilis)** is marked by the appearance of a small, painless red pustule on the skin or mucous membrane between 10 and 90 days after exposure. The lesion may appear anywhere on the body where contact with a lesion on an infected person has occurred, but it is seen most often in the anogenital region. It quickly erodes, forming a painless, bloodless ulcer, called a *chancre,* exuding a fluid that swarms with spirochetes. The chancre may not be noticed by the patient, and many people may become infected. It heals spontaneously within 10 to 40 days, often creating the mistaken impression that it was not a serious symptom. The second stage **(secondary syphilis)** occurs about 2 months later, after the spirochetes have increased in number and spread throughout the body. This stage is characterized by general malaise; anorexia; nausea; fever; headache; alopecia; bone and joint pain; and the appearance of a morbilliform rash that does not itch, flat white sores in the mouth and throat, or condylomata lata papules on the moist areas of the skin. The disease remains highly contagious at this stage and can be spread by kissing. The symptoms usually continue from 3 weeks to 3 months but may recur over a period of 2 years. The third stage **(tertiary syphilis)** may not develop for 3 to 15 or more years. It is characterized by the appearance of soft rubbery tumors, called *gummas,* that ulcerate and heal by scarring. Gummas may develop anywhere on the surface of the body and in the eye, liver, lungs, stomach, or reproductive organs. Tertiary syphilis may be painless, unnoticed except for gummas, or it may be accompanied by deep, burrowing pain. The ulceration of the gummas may result in punched-out areas of the palate, nasal septum, or larynx. Various tissues and structures of the body, including the central nervous system, myocardium, and valves of the heart, may be damaged or destroyed, leading to mental or physical disability and premature death. **Congenital syphilis** resulting from prenatal infection may result in the birth of a deformed or blind infant or stillborn child. In some cases, the infant appears to be well until, at several weeks of age, snuffles, sometimes with a blood-stained or mucopurulent discharge, and skin lesions, particularly on the palms and soles or in the genital region, are observed. Such children also may have visual or hearing defects, and progeria and poor health may develop. Diagnosis of syphilis is made by dark field microscopy of fluid from primary or secondary stage lesions, by bacteriological study of blood samples, and by an examination of cerebrospinal fluid. Because of the slow development of the disease during the early stages, the various serological tests, including the obsolete Wassermann, may not produce accurate findings until months after exposure. Repeated tests and cross-checking with more than one test may be required in some cases. The report by a person that exposure to syphilis has occurred is often the only evidence available to the clinician.

■ INTERVENTIONS: Patients with primary or secondary syphilis are usually given benzathine, penicillin G benzathine, or an equivalent in a single dose of 2.4 million units intramuscularly. The objective is to maintain penicillin in the bloodstream for a number of days because *Treponema pallidum* divides at an average rate of once every 33 hours, and the antibiotic is most effective during the stage of cell division. Larger doses of penicillin, 7.2 million units total, are administered in 3 doses 1 week apart for tertiary syphilis. Infants and small children with congenital syphilis are usually given 50,000 units/kg intramuscularly. Treatment of an infected mother with penicillin during the first 4 months of pregnancy usually prevents the development of congenital syphilis in the fetus. Treating the mother with antibiotics later in the pregnancy usually eliminates the infection but may not protect the fetus. Patients should be reexamined clinically and serologically 3 months and 6 months after treatment. Human immunodeficiency virus-infected patients (also infected with syphilis) should be seen at 1, 2, 3, 6, 9, and 12 months for follow-up observation.

■ NURSING CONSIDERATIONS: Special care and aseptic precautions are taken while handling the highly contagious fluid from syphilitic lesions used in diagnostic testing because the infection may be acquired through a cut or break in the skin. The nurse discusses with the patient the disease course, its treatment, and ways of preventing future infections. The extremely contagious nature of the infection is explained, and the importance of treatment for all who may have been exposed is emphasized. Tact, patience, and understanding are required to reassure the patient and to secure the patient’s cooperation in accepting treatment and in assisting in the identification and location of others needing treatment. Active, serologically documented cases of syphilis must, by law, be reported to local departments of health throughout the United States.



Primary syphilis *(Swartz, 2009)*



Secondary syphilis *(Callen et al, 2000)*

syphilitic, pertaining to, resembling, or infected with syphilis. Also **luetic** /lo͞o·et'ik/.

syphilitic aortitis, inflammation of the aorta occurring in tertiary syphilis. It is characterized by diffuse dilation with gray, wheal-like plaques containing calcium on the inside and scars and wrinkles on the outside of the aorta. The middle layer of the aortic wall is usually infiltrated with plasma cells and contains fragments of damaged elastic tissue and many newly formed blood vessels. There may be damage to the cardiac valves, narrowing of the mouths of the coronary arteries, and formation of thrombi. Cerebral embolism may result. Signs of syphilitic aortitis are substernal pain, dyspnea, bounding pulse, and high systolic blood pressure. Penicillin may slow the course of the disease, but it cannot reverse the structural damage to the vessels and the heart. Also called **Döhle-Heller disease, luetic aortitis.**

syphilitic dementia [L, *de* + *mens,* mind], a form of dementia resulting from a syphilis infection. Specific symptoms may vary from memory impairment to personality changes and are severe enough to interfere with social and occupational activities. If untreated, the disease may progress to dementia paralytica, paralysis, and death.

syphilitic endocarditis [L, *endon,* within, *kardia,* heart, *itis,* inflammation], a thickening and stretching of the cusps of the aortic valve, with aortic valve incompetence, caused by a syphilis infection of the aorta.

syphilitic fever [L, *febris*], pyrexia that is caused by a syphilis infection.

syphilitic heart disease. See **cardiovascular disease.**

syphilitic meningoencephalitis. See **general paresis.**

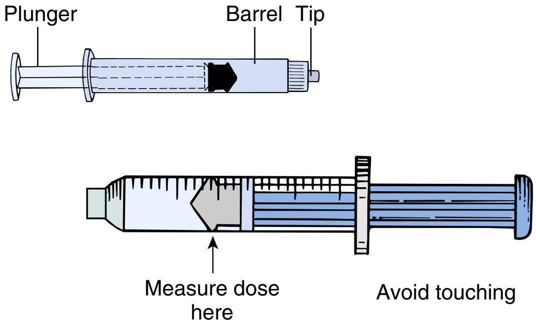
syphilitic periarteritis, an inflammatory condition of the outer coat of one or more arteries occurring in tertiary syphilis and characterized by soft gummatous perivascular lesions infiltrated with lymphocytes and plasma cells. Also called **periarteritis gummosa.** See also **syphilitic aortitis.**

syphilitic retinopathy [L, *rete,* net; Gk, *pathos,* disease], an invasion of the retina and optic nerve by a spreading syphilis infection. Primary retinal lesions are associated with the blood vessels, and the choroid layer is often affected first. There may be occlusion of the retinal vessels.

syr., abbreviation for the Latin *syrupus,* "syrup."

syring-. See **syringo-.**

syringe /sərinj′, sir′inj/ [Gk, *syrinx,* tube], a device for withdrawing, injecting, or instilling fluids. A syringe for the injection of medication usually consists of a calibrated glass or plastic cylindric barrel with a close-fitting plunger at one end and a small opening at the other to which the head of a hollow-bore needle is fitted. Medication of the desired amount may be pulled up into the barrel by suction as the plunger is withdrawn and injected by pushing the plunger back into the barrel, forcing the liquid out through the needle. A syringe for irrigating a wound or body cavity or for extracting mucus or another body fluid from an orifice or body cavity is usually larger than the kind used for injection. It often has a rubber bulb at one end and a blunt, soft-tipped flexible tube with an opening at the other end. The bulb is squeezed to eject a fluid and is released to withdraw one. Kinds of syringes include **Asepto syringe, bulb syringe, hypodermic syringe, Luer-Lok syringe.**



Parts of a syringe *(Potter et al, 2011)*

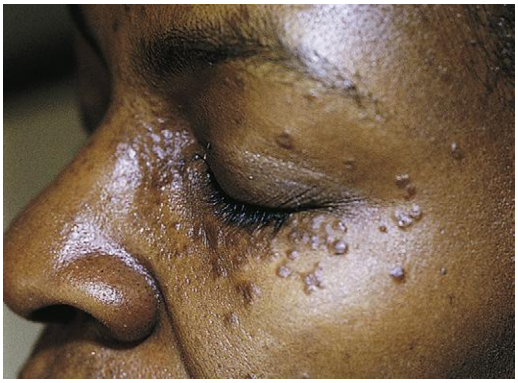
syringectomy /sir′injek′təmē/ [Gk, *syrinx,* tube, *ektomē,* excision], a surgical procedure for excising the walls of a fistula.

syringo-, syring-, prefix meaning "tube or a fistula": *syringobulbia, syringocystoma, syringomyelitis.*

syringobulbia /si·ring′gō·bul′bē·ə/ [Gk, *syrinx,* tube; L, *bulbus,* swollen root], syringomyelia in which the cavity extends to involve the medulla oblongata. See also **syringomyelia.**

syringoencephalomyelia /siring′gō·ensef′əlō′mī·ē′lyə/, a progressive disorder characterized by cavitation of the spinal cord. It may occur anywhere from the medulla oblongata to the thoracic segments but usually appears in cervical segments.

syringoma *pl. syringomas, syringomata* /sir′ing·gō′mə/, a benign tumor derived from an eccrine sweat gland. It appears as a small, smooth papule the color of the underlying skin, often on the upper body of a postpubertal woman. Some are typically multiple, often appearing on the lower eyelids.



Syringomas *(Callen et al, 2000)*

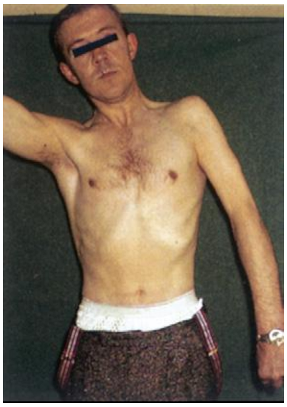
syringomeningocele /-məning′gōsēl′/ [Gk, *syrinx,* tube, *meninx,* membrane, *kele,* hernia], a meningocele that is connected to the central canal of the spinal cord. See also **spina bifida.**

syringomyelia /-mī·ē′lyə/ [Gk, *syrinx,* tube, *myelos,* marrow], a chronic progressive disease of the spinal cord, marked by elongated central fluid-containing cavities surrounded by gliosis or a proliferation of neurological tissue. Symptoms begin early in adulthood, usually involving the cervical region, with muscular wasting in the upper limbs. The disease is more common in males.

■ OBSERVATIONS: Although present at birth, onset is insidious, and manifestations are often not seen until individuals are in their 20s or 30s. These symptoms are often ambiguous and mimic a host of other diseases. The cervical spine is most commonly affected and manifests as weakness, atrophy, and sensory loss in the shoulders, arms, and hands, including loss of pain and temperature sensation and sweating on the face. Upper extremity reflexes are diminished or absent, whereas weakness, altered gait, spasticity, and hyperreflexia may be noted in the lower extremities. Brainstem involvement may cause dysphagia, ptosis, miosis, or diplopia. GI symptoms include nausea, vomiting, weight loss, and abdominal spasms. Respiratory disturbances may manifest during sleep. Joint arthropathy and trophic skin changes may eventually develop. The course of the disease is variable and may result in slow, long-term incapacitation. Disease progress may slow or stop at any time. Diagnosis is made through MRI. Bony abnormalities at the base of the skull and C1-2 spine and scoliosis may be seen on x-ray.

■ INTERVENTIONS: The primary intervention is a cervical decompression laminectomy at C1-2 spine with repair or removal of bony abnormalities, with possible myelotomy or shunt placement. Although surgical intervention halts disease progression, it seldom leads to significant improvement in current neurological manifestations.

■ NURSING CONSIDERATIONS: Nursing care after surgery is aimed at careful positioning and turning to maintain proper alignment of the cervical spine and head; control of postoperative pain; surgical wound care; monitoring for CSF leakage and peripheral vital signs; assessment of motor and sensory function in the extremities and bowel and bladder function. Chronic care focuses on rehabilitation for the sequelae from neurological damage that occurred before the surgery. These are varied and may include bowel and bladder programs for management of neurogenic bowel or bladder; protection against injury and breakdown of skin related to decreased sensation; physical therapy to build strength and endurance; occupational therapy to improve or adapt functioning; respiratory therapy to increase vital capacity and tidal volume; and speech therapy if swallowing is affected. Counseling and support services are provided for the individual and family to aid in adaptation.



Syringomyelia *(Moll, 1997)*

syringomyelocele /siring′gōmī′əlōsēl′/ [Gk, *syrinx* + *myelos,* marrow, *kele,* hernia], a hernial protrusion of the spinal cord through a congenital defect in the vertebral column. The cerebrospinal fluid within the central cavities of the cord is greatly increased so that the cord tissue forms a thin-walled sac that lies close to the membrane of the cavity. See also **myelomeningocele, neural tube defect, spina bifida.**

syrup of ipecac /sir′əp/, an emetic preparation of ipecac fluid extract, glycerin, and syrup used to treat certain types of poisonings and drug overdoses. It is no longer routinely used. See also **ipecac.**

system /sis′təm/ [Gk, *systema*], **1.** a collection or assemblage of parts that, unified, make a whole. Physiological systems, such as the cardiovascular or reproductive system, are made up of structures specifically able to engage in processes that are essential for a vital function in the body. **2.** a set of computer programs and hardware that work together for some specific purpose.

systematic /sis′təmat′ik/ [Gk, *systema*], pertaining to a system.

systematic error [Gk, *systema* + L, *errare,* to wander], a nonrandom statistical error that affects the mean of a population of data and defines the bias between the means of two populations.

systematic heating, the elevation of the temperature of the whole body.

systematic reviews, a scientific investigation that asks a specific question and uses explicit, rigorous, prespecified methods to identify, critically appraise, select, and summarize findings of similar but separate studies. Systematic reviews are the cornerstone of evidence-based health-care decision making.

systematic tabulation, (in research) mechanical or manual techniques for recording and classifying data for statistical analysis.

system documentation. See **documentation.**

systemic /sistem′ik/ [Gk, *systema*], pertaining to the whole body rather than to a localized area or regional part of the body.

systemic circulation [Gk, *systema* + L, *circulare,* to go around], the general blood circulation of the body, not including the lungs. Also called **greater circulation.**

systemic desensitization, a technique used in behavior therapy for eliminating maladaptive anxiety associated with phobias. The procedure involves the construction by the person of a hierarchy of anxiety-producing stimuli and the general presentation of these stimuli until they no longer elicit the initial response of fear. Also called **desensitization.** Compare **flooding.** See also **reciprocal inhibition.**

systemic heart, side of the heart, which moves oxygenated blood through the systemic circulation.

systemic hypertension. See **cardiovascular disease.**

systemic immunoblastic proliferation, a condition of immature lymphocyte production resulting in rash, breathing difficulty, enlarged spleen, lymphadenopathy, and increased incidence of immunoblastic lymphoma.

systemic infection [Gk, *systema* + L, *inficere,* to stain], an infection in which the pathogen is distributed throughout the body rather than concentrated in one area.

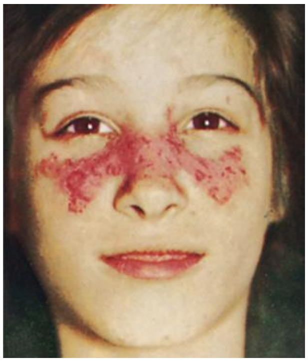
systemic lesion [Gk, *systema* + L, *laesio,* attack], a pathological disturbance that involves a system of tissues with a common function.

systemic lupus erythematosus (SLE), a chronic inflammatory disease affecting many systems of the body. It is an example of a collagen disease. The pathophysiological characteristics of the disease include severe vasculitis, renal involvement, and lesions of the skin and nervous system. The primary cause of the disease has not been determined; viral infection or dysfunction of the immune system has been suggested. Adverse reaction to certain drugs also may cause a lupuslike syndrome. Four times more women than men have SLE. Also called **disseminated lupus erythematosus.** See also **discoid lupus erythematosus.**

■ OBSERVATIONS: The initial manifestation is often arthritis. An erythematous rash ("butterfly rash") over the nose and malar eminences, weakness, fatigue, and weight loss also are frequently seen early in the disease. Photosensitivity, fever, skin lesions on the neck, and alopecia where the skin lesions extend beyond the hairline may occur. The skin lesions may spread to the mucous membranes and other tissues of the body. They do not ulcerate but cause degeneration of the affected tissues. Depending on the organs involved, the patient also may have glomerulonephritis, pleuritis, pericarditis, peritonitis, neuritis, or anemia. Renal failure and severe neurological abnormalities are among the most serious manifestations of the disease. Diagnosis of SLE is made by subjective and objective findings based on physical examination and laboratory findings, including antinuclear antibody in the cerebrospinal fluid and a positive lupus erythematosus cell reaction in a lupus erythematosus preparation. Other laboratory examinations may be useful, depending on the organs, tissues, and systems affected by the disease.

■ INTERVENTIONS: In many cases SLE may be controlled with corticosteroid medication administered systemically. Care and treatment vary with the severity and nature of the disease and the body systems that are affected. Topical steroids may be applied to the rash. Salicylates may be given to alleviate pain and swelling in the joints. Fatigue and stress are prevented, and all body surfaces are protected from direct sunlight. Antimalarial drugs are sometimes given to treat cutaneous lesions, but retinal damage may occur with prolonged use.

■ NURSING CONSIDERATIONS: The timing, dosage, side effects, and toxic reactions to the medications are explained before discharge. The steroids must be taken exactly as prescribed, and, in the event that the patient cannot take them, the doctor is to be consulted promptly. The patient should carry an identification card bearing his or her diagnosis, a list of all medications and their dosage, and the doctor's name and telephone number. As in any disease marked by chronic remission and exacerbation of many distressing symptoms, the patient may require extensive emotional and psychological support.



Classic butterfly rash of systemic lupus erythematosus *(Kliegman et al, 2007)*

systemic mycosis [Gks, *systema* + *mykes,* fungus, *osis,* condition], a fungal infection that involves more than one body system or area.

systemic onset juvenile rheumatoid arthritis. See **juvenile rheumatoid arthritis.**

systemic oxygen consumption, the amount of oxygen consumed by the body per minute.

systemic remedy, a medicinal substance that is given orally, parenterally, or rectally to be absorbed into the circulation for treatment of a health problem. Many remedies or medications administered locally or regionally are to some degree absorbed systemically. Medication administered systemically may have various local effects, but the intent is to treat the whole body.

systemic sclerosis, a form of scleroderma characterized by formation of thickened collagenous fibrous tissue, thickening of the skin, and adhesion of the skin to underlying tissues. The disease, which may be preceded by Raynaud's phenomenon, progresses to involve the tissues of the heart, lungs, muscles, genitourinary tract, and kidneys. See also **scleroderma.**

systemic toxin clearance: dialysis, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as clearance of toxins from the body with peritoneal dialysis or hemodialysis. See also **Nursing Outcomes Classification.**

systemic vascular resistance (SVR), the resistance the left ventricle must overcome to pump blood through the systemic circulation. As peripheral blood vessels constrict, the SVR increases.

systemic vein, one of a number of veins that drain deoxygenated blood from most of the body, as opposed to the pulmonary circulation. Systemic veins arise in tiny plexuses that receive blood from capillaries and converge into trunks that increase in size as they pass toward the heart. They are larger and more numerous than the arteries, have thinner walls, and collapse when they are empty. Groups of systemic veins include the coronary veins, the superior vena cava and its tributaries in the upper body, and the inferior vena cava and its tributaries in the lower body.

systemic venous hypertension, elevation of the venous pressure, usually detected by inspection of the jugular veins and most often caused by disease of the right heart or pericardium.

system of care /sis′təm/, a framework within which health care is provided, comprising health care professionals; recipients, consumers, or patients; energy resources or dynamics; organizational and political contexts or frameworks; and processes or procedures. Current theory recognizes that an analysis of the provision of health care requires knowledge of the systems of care.

system overload, an inability to cope with messages and expectations from a number of sources within a given time limit.

systems integration, the unification of disparate computer hardware and software to achieve usability and transferability of data, such as throughout a managed care or provider network.

systems software, a group of computer utility programs that control the execution of application programs.

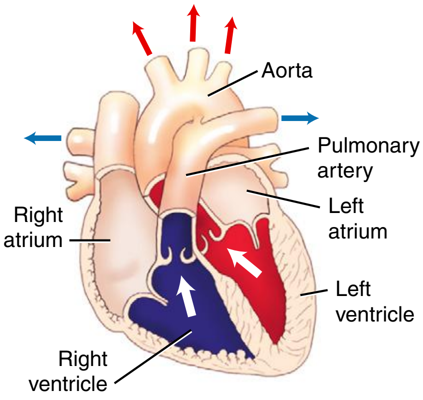
systems theory, a holistic medical concept in which the human patient is viewed as an integrated complex of open systems rather than as semiindependent parts. The health care approach in this theory requires the incorporation of family, community, and cultural factors as influences to be considered in the diagnosis and treatment of the patient.

systole /sis′təlē/ [Gk, *systole,* contraction], the contraction of the heart, driving blood into the aorta and pulmonary arteries. The occurrence of systole is indicated by the first heart sound heard on auscultation, by the palpable apex beat, and by the peripheral pulse. **—systolic,** *adj.*

-systole, suffix meaning “types and locations of the higher blood pressure measurement”: *dyssystole, hysterosystole, tachysystole.*

systolic. See **systole.**

systolic click [Gk, *systole,* contraction; Fr, *cliqueter,* to click], a sharp, clicking sound heard in mid- or late systole and believed to originate from the abnormal motion of the mitral valve. The most frequent cause of systolic clicks is prolapse of a mitral valve leaflet, in which case there may be an associated late systolic regurgitant murmur, sometimes called the *click-murmur syndrome*. Compare **ejection click.**



During systole, the heart contracts and blood is pushed out of the heart *(Leonard, 2012)*

systolic click-murmur syndrome. See **Barlow’s syndrome.**

systolic dysfunction, a loss of cardiac muscle with volume overload and decreased contractility.

systolic ejection period, the amount of time the ventricles spend in systole per minute.

systolic gradient, the difference between the pressure in the left atrium and that in the left ventricle during systole.

systolic murmur, a cardiac murmur occurring during systole. Systolic murmurs include **ejection murmurs,** often heard in pregnant women or in people with anemia, thyrotoxicosis, or aortic or pulmonary stenosis; **pansystolic murmurs,** heard in people with incompetence of the mitral or tricuspid valve; and late systolic murmurs, also caused by mitral valve incompetence and, less commonly, by tricuspid regurgitation.

systolic pressure, the blood pressure measured during the period of ventricular contraction (systole). In blood pressure readings, it is the higher of the two measurements.

T

***T*,** abbreviation for *absolute temperature*.

t, symbol for **time.**

T, **1.** symbol for **temperature. 2.** abbreviation for **tumor.** See **cancer staging. 3.** symbol for **occupancy factor.**

$T_{1/2}$, symbol for the **half-life** of a radioactive isotope. Half-life has -$t^{1/2}$.

T1, T2, …, symbols for thoracic nerves.

T_1, T_2. See **relaxation time.**

T_3, symbol for **triiodothyronine.**

T_4, symbol for **thyroxine.**

T-4 cell, a thymus-derived lymphocyte of the body's immune system that activates the humoral immune system (B cells) and destroys or neutralizes cells or substances identified as "nonself." T-4 cells secrete a substance, interleukin-2, which stimulates the activity of natural killer cells, gamma interferon, and suppressor T-8 cells. The human immunodeficiency virus commonly targets T-4 cells, with the result that the body's immune defenses are severely damaged and opportunistic infections are allowed to flourish.

ta-. See **tono-.**

Ta, symbol for the element **tantalum.**

TA, abbreviation for **transactional analysis.**

tabardillo. See **Mexican typhus.**

tabe-, prefix meaning "wasting (away)": *tabefaction, tabescent, tabetiform*.

tabes /tā′bēz/ [L, *tabes,* wasting], a gradual, progressive wasting of the body in any chronic disease.

tabes dorsalis [L, *tabes,* wasting, *dorsum,* the back], an abnormal condition characterized by the slow degeneration of all or part of the body and the progressive loss of deep tendon reflexes, caused by syphilis. This disease involves the posterior columns and posterior roots of the spinal cord and destroys the large joints of affected limbs in some individuals. A wide-base ataxic gait is usually present. It is often accompanied by incontinence and impotence and severe flashing pains in the abdomen and extremities.

tabetic crisis /tābet′ik/ [L, *tabes,* wasting; Gk, *krisis,* turning point], an exacerbation of pain in tabes dorsalis because of syphilis.

tabetic gait [L, *tabes,* wasting; ONorse, *gata,* a way], a high-stepping gait associated with tabes dorsalis, a disease in which the posterior or dorsal columns of the spinal cord and the sensory nerve trunks degenerate.

tabetic neuritis [L, *tabes,* wasting; Gk, *neuron,* nerve, *itis,* inflammation], a form of neuritis that accompanies a syphilitic infection or tabes dorsalis, involving the dorsal posterior column spinal pathways.

table [L, *tabula*], **1.** any structure with a flat surface. **2.** a chart showing columns of data.

tablespoon (Tbs, tbsp), a household spoon that may be used to measure a dose of liquid medicine, equivalent to about 4 fluid drams or ½ fluid ounce or 15 mL.

tablet /tab′lit/ [Fr, *tablette,* lozenge], a small, solid dosage form of a medication. It may be compressed or molded in its manufacture, and it may be of almost any size, shape, weight, and color. Most tablets are intended to be swallowed whole, but some may be dissolved in the mouth, chewed, or dissolved in liquid before swallowing, and some may be placed in a body cavity.

taboo /təbo͞o′/, something that is forbidden by a society as unacceptable or improper. Incest is a taboo common to many societies.

taboparesis /tā′bōpərē′sis/ [L, *tabes,* wasting; Gk, *paralyein,* to be palsied], a form of paralysis associated with psychosis in patients with untreated syphilis. Also called *taboparalysis*.

tabula rasa /tä′bo͞olä rä′sä, tab′yəle rā′sə/, a term used to describe a child's mind at birth as a receptive "blank slate."

tache /täsh/ [Fr], a spot, stain, blot, or mark.

tache laiteuse. See **macula albida.**

tache noire /täsh nô·är′/ [Fr, black spot], a local button-like ulcer with a black center that marks the point of infection in certain rickettsial diseases such as African tick typhus and scrub typhus.

tachistoscope /təkis′təskōp′/ [Gk, *tachistos,* rapid, *skopein,* to view], a device used to increase the speed of visual perception by displaying visual stimuli only extremely briefly.

tacho-, prefix meaning "swift or rapid": *tachogram, tachography, tachometer.*

tachometer /təkom′ətər/, a device for measuring speed, such as the rate of blood flow in a vessel.

tachy- /tak′ē-/, prefix meaning "swift or rapid": *tachycardia, tachyphrenia, tachysystole*.

tachyarrhythmia /tak′ē·ərith′mē·ə/ [Gk, *tachys,* fast, *a* + *rhythmos,* rhythm], an abnormally rapid heartbeat accompanied by an irregular rhythm.

tachycardia /tak′ēkär′dē·ə/ [Gk, *tachys,* fast, *kardia,* heart], a condition in which the heart contracts at a rate greater than 100 beats/min. It may occur normally in response to fever, exercise, or nervous excitement. Pathological tachycardia accompanies anoxia, such as that caused by anemia; congestive heart failure; hemorrhage; or shock. Tachycardia acts to increase the amount of oxygen delivered to the cells of the body by increasing the rate at which blood circulates through the vessels. **—tachycardiac,** *adj.*

tachycardia-bradycardia syndrome. See **bradycardia-tachycardia syndrome.**

tachycardiac /-kär′dē·ak/ [Gk, *tachys,* fast, *kardia,* heart], pertaining to or affected by tachycardia.

tachykinin. See **substance P.**

tachyphagia /-fā′jē·ə/, rapid or hasty eating.

tachyphylaxis /tak′ēfəlak′sis/ [Gk, *tachys* + *phylax,* guard], **1.** (in pharmacology) a phenomenon in which the repeated administration of some drugs results in a rapidly appearing and marked decrease in effectiveness. **2.** also called **mithridatism,** (in immunology), a rapidly developing immunity to a toxin because of previous exposure, such as from previous injection of small amounts of the toxin (named for Mithridates VI who used the technique to survive an assassination attempt).

tachypnea /tak′ēpnē′ə/ [Gk, *tachys* + *pnoia,* breathing], an abnormally rapid rate of breathing (more than 20 breaths per minute in adults), such as seen with hyperpyrexia. Also spelled *tachypnoea*.

tack, the degree of stickiness of an adhesive required to affix a therapeutic foreign substance such as a transdermal delivery device to the skin.

tacrolimus, an immunosuppressive drug that modifies biological response.

■ INDICATIONS: This drug is prescribed to suppress the immune system after transplantation of the liver or other organs and can be applied topically for the treatment of dermatitis unresponsive to other medications.

■ CONTRAINDICATIONS: This drug should not be given to patients with allergy to tacrolimus or those receiving potassium-sparing diuretics, cycloSPORINE, or other immunosuppressive agents, with the exception of adrenal corticosteroids.

■ ADVERSE EFFECTS: The side effects most often reported include tremor, headache, diarrhea, hypertension, nausea, renal dysfunction, hyperglycemia, and increased risk of infection.

TAC solution, a solution of tetracaine, epinephrine, and cocaine, used as a local anesthetic in the emergency treatment of uncomplicated lacerations.

tact-, prefix meaning "touch": *tactile, tactilogical, taction*.

-tactic, -tactical, -taxic, **1.** suffix meaning "exhibiting agent-controlled orientation or movement": *chemotactic, eosinotactic, thermotactic*. **2.** suffix combining form meaning "having an arrangement of something": *cytotactic, leukotactic, phyllotactic*.

tactile /tak′təl/ [L, *tactus,* touch], pertaining to the sense of touch.

tactile amnesia [L, *tactus* + Gk, *amnesia,* forgetfulness], a loss of the ability to determine the shape of objects through the sense of touch. See also **astereognosis.**

tactile anesthesia, the absence or lack of the sense of touch in the fingers, possibly resulting from injury or disease. This condition can be congenital or psychosomatic and may cause the patient to incur severe burns, serious cuts, contusions, or abrasions. See also **traumatic anesthesia.**

tactile corpuscle. See **Meissner's corpuscle.**

tactile defensiveness, a sensory integrative dysfunction characterized by tactile sensations that cause excessive emotional reactions, hyperactivity, or other behavior problems.

tactile discrimination [L, *tactus* + *discrimen,* division], the ability to discriminate among objects by the sense of touch.

tactile fremitus, a tremulous vibration of the chest wall during speaking that is palpable on physical examination. Tactile fremitus may be decreased or absent when vibrations from the larynx to the chest surface are impeded by chronic obstructive pulmonary disease, obstruction, pleural effusion, or pneumothorax. It is increased in pneumonia. Compare **vocal fremitus.**

tactile hair [L, *tactus* + AS, *haer*], a hair shaft that is sensitive to the sensation of touch.

tactile hallucination [L, *tactus* + *alucinare,* to wander in mind], a subjective experience of touch in the absence of tactile stimulation. It is most common in delirium tremens or alcoholic hallucinosis.

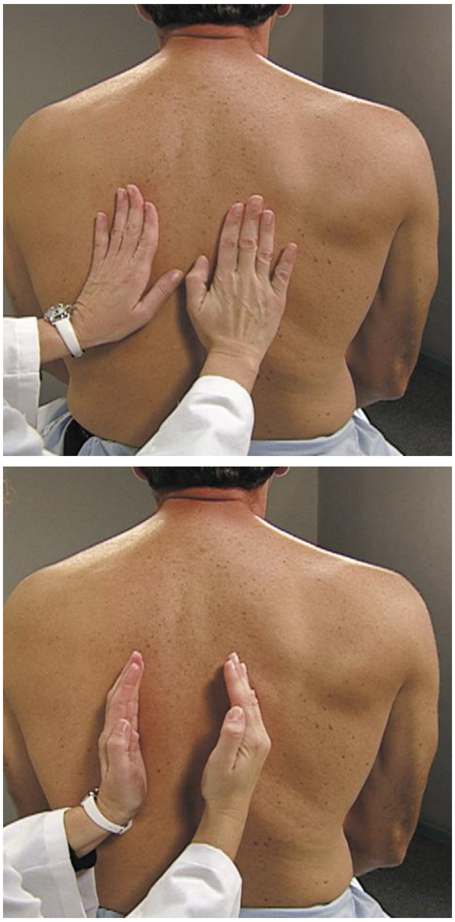
tactile hyperesthesia [L, *tactus* + Gk, *hyper,* excessive, *aesthesis,* sensitivity], an abnormal increase in the sense of touch.

tactile image, a mental concept of an object as perceived through the sense of touch. See also **image.**

tactile localization [L, *tactus* + *locus,* place], the ability to identify, without looking, the exact point on the body where a tactile stimulus is applied. The localization test is applied in sensory evaluation tests.

tactile sensation [L, *tactus* + *sentire,* to feel], the sensation of touch.

tactile system [L, *tactus* + Gk, *systema*], the part of the nervous system that is concerned with the sense of touch.



Evaluation of tactile fremitus

(Seidel et al, 2011)

tadalafil, an impotence agent.

■ INDICATION: This drug is used in the treatment of erectile dysfunction.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Patients who are taking organic nitrates either regularly or intermittently and patients taking any alpha-adrenergic antagonist other than tamsulosin (0.4 mg once daily) should not take this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include back pain or myalgia, blurred vision, changes in color vision, and pruritus. Life-threatening side effects include myocardial infarction, cardiovascular collapse, and sudden death. Common side effects include headache, flushing, dizziness, dyspepsia, nasal congestion, urinary tract infection, and diarrhea.

Taenia /tē′nē·ə/ [Gk, *tainia,* ribbon], a genus of large parasitic intestinal flatworms of the family Taeniidae, class Cestoda, having an armed scolex and a series of segments in a chain. Taeniae are among the most common parasites infecting humans and include *T. saginata,* the beef tapeworm, and *T. solium,* the pork tapeworm.

taenia-. See **tenia-.**

Taenia saginata, a species of tapeworm that inhabits the tissues of cattle during its larval stage and infects the intestine of humans in its adult form. *T. saginata* may grow to a length of between 12 and 25 feet and is the tapeworm species that most often infects humans. Also called **beef tapeworm.** See also **tapeworm, tapeworm infection.**

taeniasis /tēnī′əsis/ [Gk, *tainia* + *osis*, condition], an infection with a tapeworm of the genus *Taenia*. Transmission is through ingestion of undercooked pork containing cysticercus or food contaminated with pig feces containing eggs. See also **tapeworm infection.**

Taenia solium, a species of tapeworm that most commonly inhabits the tissues of pigs during its larval stage and infects the intestine of humans in its adult form. Infrequently humans serve as the intermediate hosts for this tapeworm, and larval infestation of the muscle and brain tissue may occur. Also called **pork tapeworm.** See also **cysticercosis, tapeworm, tapeworm infection.**

TAF, abbreviation for **tumor angiogenesis factor.**

tag, a small piece of epidermal and dermal fibrovascular tissue attached by one margin or a pedicle to a main structure.

TAG, abbreviation for *3,4,6-tri-o-acetyl-*D*-glucal*.

Tagamet, a trademark for a histamine H_2 receptor antagonist **(cimetidine).**

tai chi, a technique that uses slow, purposeful, motor-physical movements of the body for the purpose of control to increase outer body mass strength and achieve a more balanced physiological and psychological state. Tai chi has positive effects on the respiratory, cardiovascular, and cerebral functions in both children and older adults, including reducing the incidence of falls in older people.

tail, the caudal extremity of an organ or body, such as an axillary tail of a mammary gland.

tail bud. See **end bud.**

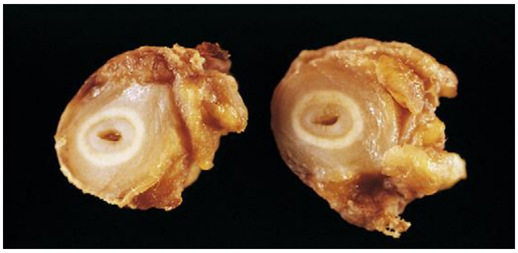
tail fold [AS, *taegel* + *fealdan,* to fold], a curved ridge formed at the caudal end of the early developing embryo. It consists of the tail bud, which in lower animals gives rise to the caudal appendage and in humans forms the hindgut.

tail of Spence, the upper outer tail of breast tissue that extends into the axilla.

tail of spermatozoon, the flagellum of a spermatozoon. It has four regions: the neck, middle piece, principal piece, and end piece.

tailor's bunion. See **bunionette.**

Takayasu's arteritis /tä′kəyä′so͞oz/ [Mikito Takayasu, Japanese surgeon, 1860–1938], an inflammation of the aorta, its major branches, and the pulmonary artery. It is characterized by progressive occlusion of the innominate, left subclavian, and left common carotid arteries above their origin in the aortic arch. Signs of the disorder are absence of a pulse in both arms and in the carotid arteries, transient paraplegia, transient blindness, and atrophy of facial muscles. Also called **brachiocephalic arteritis, Martorell's syndrome, pulseless disease, reversed coarctation.** See also **aortic arch syndrome.**



Takayasu's arteritis *(Kumar et al, 2007)*

take, a popular term for a satisfactory response, as of a vaccination or tissue graft.

talc /talk/ [Ar, *talq*], a native, hydrous magnesium silicate, sometimes containing a small proportion of aluminum silicate, used as a dusting powder and adsorbent in clarifying liquids. Also called **talcum.**

talcosis /talkō′sis/, a silicosis-like respiratory disorder caused by inhalation of magnesium silicate dust.

talcum. See **talc.**

talip-, prefix meaning "a nontraumatic (usually congenital) twisting defect or clubfooted": *taliped, talipes, talipomanus.*

talipes /tal′ipēz/ [L, *talus,* ankle, *pes,* foot], a deformity of the foot and ankle, usually congenital, in which the foot is twisted and relatively fixed in an abnormal position. Talipes refers to deformities that involve the foot and ankle, whereas pes refers only to deformities of the foot. Kinds of talipes include **talipes calcaneovalgus,** *talipes calcaneovarus,* and **talipes equinovarus.** See also **clawfoot, flatfoot.**

talipes calcaneovalgus. See **clubfoot.**

talipes cavus. See **clawfoot.**

talipes equinovarus. See **clubfoot.**

talipes equinus. See **pes equinus.**

talipes valgus. See **splayfoot.**

talipes varus, a deformity of the foot in which the heel is turned inward from the midline of the leg.

tallow /tal′ō/, **1.** a hard fat obtained from the bodies of ruminant animals such as cattle and sheep and used in soaps and lubricants. **2.** a vegetable fat obtained from plants, such as the wax myrtle.

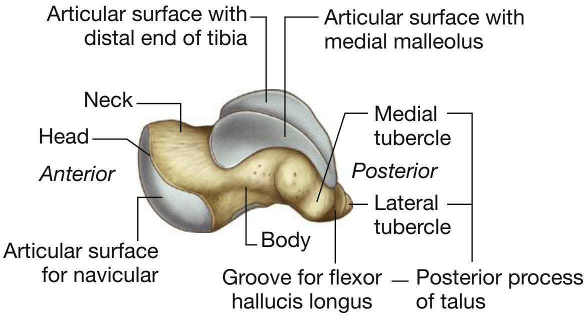
talo-, prefix meaning "ankle": *talocalcaneal, talocrural, talofibular.*

talocalcaneonavicular joint, a complex joint in which the head of the talus articulates with the calcaneus and plantar calcaneonavicular ligament below and the navicular in front. It allows gliding and rotation movements, which are involved with inversion and eversion of the foot. It also participates in pronation and supination.

talofibular /tā′lōfib′yələr/, pertaining to the talus and the fibula.

talonavicular /tā′lōnəvik′yələr/ [L, *talon,* bird claw, *naviculus,* scaphoid], pertaining to the talus and the navicular bones.

talus /tā′ləs/ *pl.* **tali** [L, ankle], the second largest tarsal bone. It supports the tibia, rests on the calcaneus, and also articulates with the malleoli and navicular bones. It consists of a body, neck, and head. Also called **ankle bone, astragalus.**



Articular surface with distal end of tibia
Articular surface with medial malleolus
Neck
Head
Anterior
Medial tubercle
Posterior
Lateral tubercle
Articular surface for navicular
Body
Groove for flexor hallucis longus
Posterior process of talus

Talus *(Drake, Vogl, and Mitchell, 2010)*

Talwin, a trademark for a mu antagonist/kappa agonist opioid analgesic (pentazocine).

Tambocor, a trademark for an oral antiarrhythmic drug **(flecainide acetate).**

tambour /tam′bo͝or/, a cylindric drumlike device connected to an air tube and stylus, used to record sphygmographic or other physiological data.

Tamm-Horsfall protein (THP) [Igor Tamm, American virologist, 1922–1995; Frank L. Horsfall, American virologist, 1906–1971], a mucoprotein found in the matrix of renal tubular casts. THP is secreted in the loop of Henle.

tamoxifen /təmok′səfin/, a nonsteroidal antiestrogen used in the palliative treatment of advanced breast cancer in premenopausal and postmenopausal women whose tumors are estrogen dependent. Tamoxifen has also been used to reduce the incidence of breast cancer in women with a high risk for developing it and for treating gynecomastia, precocious puberty, and other instances of estrogen excess.

tampon /tam′pon/ [Fr, plug], a packed cotton, a sponge, or other material for checking bleeding or absorbing secretions in cavities or canals or for holding displaced organs in position.

tamponade /tam′pənād′/ [Fr, *tamponner,* to plug up], stoppage of the blood flow to an organ or a part of the body by pressure, such as by a tampon or a pressure dressing applied to stop a hemorrhage or by the compression of a part by an accumulation of fluid, such as in cardiac tamponade.

tamsulosin, a selective antiadrenergic agent.

■ INDICATIONS: This drug is used to treat symptoms of benign prostatic hyperplasia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include asthenia, insomnia, chest pain, amblyopia, floppy iris syndrome, nausea, diarrhea, dysgeusia, decreased libido, abnormal ejaculation, back pain, rhinitis, pharyngitis, and cough. Common side effects include dizziness and headache.

tandem mass spectrometry (MS/MS), a two-step technique used to analyze a sample for a predetermined set of substances, either by using a separate mass spectroscope for each step or by using the same spectroscope to perform the steps sequentially. In the first stage, a predetermined set of ions is selected for fragmentation; in the second, mass spectra are produced for the fragments. This technique is used in screening newborns for multiple metabolic disorders from a single blood sample.

tandem repeat, appearance of two or more identical segments close to each other within a strand of DNA.

tangentiality /tanjen′chē·al′itē/ [L, *tangere,* to touch], expressions or responses characterized by a tendency to digress from an original topic of conversation, in which a common word connects two unrelated thoughts. For example, the boy caught a ball; balls of fire exploded from the house. Tangentiality can destroy or seriously hamper the ability of people to communicate effectively. It is frequently seen in schizophrenia.

tangible elements /tan′jibəl/ [L, *tangere* + *elementum,* first principle], objects that can be seen or touched as distinguished from emotions, knowledge, or abstractions.

Tangier disease /tanjir′/ [Tangier Island, Virginia], a rare genetic disorder resulting in a deficiency of high-density lipoproteins, characterized by low blood cholesterol and an abnormal orange or yellow discoloration of the tonsils and pharynx. There also may be enlarged lymph nodes, liver, and spleen; muscle atrophy; and peripheral neuropathy. No specific treatment is known.

tangle /tang′gəl/, a dense mass of interlacing of fibers, sometimes appearing as a loose knot, such as intraneural fibrillary tangle.

taniae coli, three narrow bands of longitudinal muscles in the walls of the large intestine, which are primarily observed in the cecum and colon and less visible in the rectum.

tannic acid /tan′ik/ [Celt, *tann,* oak; L, *acidus,* sour], a substance obtained from the bark and fruit of various trees and shrubs, particularly the nutgalls of oak trees. The acid is used as an astringent and protein precipitant. Also called *tannin.*

tanning [Fr, *tanner,* to tan], a process in which the pigmentation of the skin deepens as a result of exposure to ultraviolet light. Skin cells containing melanin darken immediately. New melanin is formed within 2 to 3 days and moves upward rapidly, allowing the darkening process to continue.

tantalum (Ta) /tan′tələm/ [Gk, *Tantalus,* mythic king of Phrygia], a silvery metallic element. Its atomic number is 73; its atomic mass (weight) is 180.95. Relatively inert chemically, tantalum is used in prosthetic devices such as skull plates and wire sutures.

tantrum /tan′trəm/, a sudden outburst or violent display of rage, frustration, and bad temper, usually occurring in a maladjusted child and certain emotionally disturbed people. The activity is usually not directed at anyone or anything specific but toward the environment in general and is used primarily as a device for attempting to control others and the surroundings. It most commonly occurs at age 2 to 2-½ years. Also called **temper tantrum.**

TAO, a trademark for an antibacterial **(troleandomycin).**

tap [ME, *tappen*], **1.** to strike lightly, as in percussion or testing of reflexes. **2.** to draw off fluid through a small opening.

tape [AS, *taeppe*], strips of material, usually with adhesive, used to secure bandages.

tape-compression folliculitis, inflammation of the hair follicles caused by tape dressings placed over foam or cotton-ball pads under a graduated compression stocking. The condition is more likely to occur on patients with hairy legs who may perspire during the summer months.

tapering arch /tā′pəring/ [AS, *tapor,* slender, *arcus,* bow], a dental arch that converges from the molars to the central incisors to such a degree that lines passing through the central grooves of the molars and premolars intersect within 1 inch (2.5 cm) anterior to the central incisors.

tapetoretinopathy /tapē′tōret′inop′əthē/, a hereditary visual disorder characterized by degeneration of the sensory retina and pigmentary epithelium. It occurs in pigmentary retinopathy and other eye diseases.

tapetum, **1.** a carpetlike layer or covering of tissue. **2.** a thin sheet of fibers covering parts of the brain and continuous with the corpus callosum. **3.** the reflective part of the choroid coat of the eye in many mammals.

tapeworm /tāp′wurm/ [AS, *taeppe* + *wyrm*], a parasitic intestinal worm belonging to the class Cestoda and having a scolex and a ribbon-shaped body composed of segments in a chain. Tapeworms live as larvae in one or more vertebrate intermediate hosts and grow to adulthood in the intestine of humans. In the human alimentary canal the worm develops into an adult with an attaching head, or scolex, and numerous hermaphroditic segments, or proglottids, each of which is capable of producing eggs. Kinds of tapeworm include *Diphyllobothrium latum,* ***Taenia saginata,*** and ***Taenia solium.*** Also called **cestode.**

tapeworm infection, an intestinal infection by one of several species of parasitic worms, caused by eating raw or undercooked meat infested with tapeworm, its larvae, or food contaminated with feces containing tapeworm eggs. Symptoms of intestinal infection with adult worms are usually mild or absent, but diarrhea, epigastric pain, and weight loss may occur. Diagnosis is made when eggs or parts of the adult worm are passed in the stool. Treatment is with praziquantel and albendazole. Sanitary disposal of fecal material from affected patients is necessary to prevent the passage of larvae or eggs to other humans or other hosts. Certain species of tapeworm can infect humans during the larval stage, causing a serious, often cystic, condition of larval infestation. Also called *cestodiasis*. See also **cysticercosis, tapeworm.**

tapho-, prefix meaning “the grave”: *taphophilia, taphophobia*.

tapioca /tap′ē·ō′kə/, tiny starchy balls (pearls) or flakes made from the dried paste of grated cassava root, *Janipha manihot*. It is used as a thickener in a variety of easily digested food items, particularly cereals, soups, and puddings.

tapotement /täpôtmäN′/ [Fr, *tapoter,* to pat], a type of massage in which the body is tapped in a rhythmic manner with the tips of the fingers or the sides of the hands, using short, rapid, repetitive movements. The procedure is often used on the chest wall of patients with bronchitis to help loosen the mucus in the air passages. See also **massage.**

Taq polymerase /tak/, an enzyme found in the bacillus *Thermus aquaticus,* which lives in hot springs. It is heat resistant and thus can endure the high temperatures of the polymerase chain reaction.

tar /tär/ [AS, *teoru*], a dark, viscid organic mixture produced by the distillation of coal, wood, or vegetable matter. Some forms of tar are used to treat eczema and other skin disorders.

tarantula /təran′chələ/, a popular name for any of a number of species of large, hairy spiders. Although potentially poisonous, most are relatively harmless to humans. A bite by some species may produce an area of superficial skin destruction and may cause allergic reaction.

Tarceva, a trademark for **erlotinib.**

tardive /tär′div/ [L, *tardus,* late], describing a disease in which a period of time passes between exposure and the first symptoms.

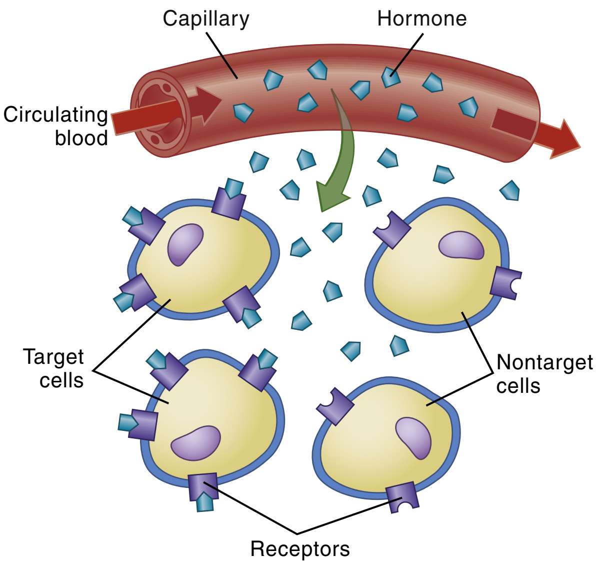
tardive dyskinesia [L, *tardus,* late; Gk, *dys,* difficult, *kinesis,* movement], an abnormal condition characterized by involuntary repetitive movements of the muscles of the face, limbs, and trunk. This disorder most commonly affects older people who have been treated for extended periods with antipsychotics but can be caused by antidopaminergic medication. The involuntary movements associated with the condition may slacken or disappear after weeks or months and have been significantly reduced in some individuals by the administration of cholinergic drugs.

tardy peroneal nerve palsy [L, *tardus* + Gk, *perone,* brooch; L, *nervus* + *paralyein,* to be palsied], a type of mononeuropathy in which the peroneal nerve is excessively compressed where it crosses the head of the fibula. Such compression may occur when an individual falls asleep with the legs crossed.

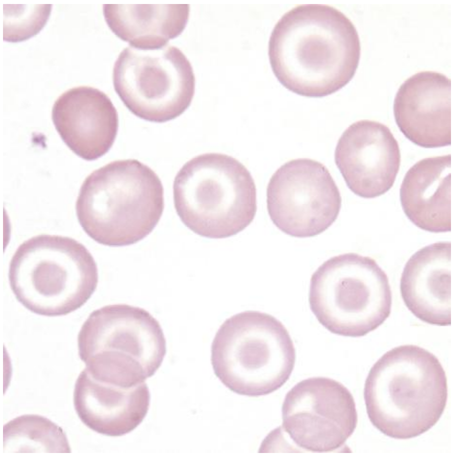
tardy ulnar nerve palsy, an abnormal condition characterized by atrophy of the first dorsal interosseous muscle and difficulty in performing fine manipulations. It may be caused by injury of the ulnar nerve at the elbow and commonly affects individuals with a shallow ulnar groove or those who persistently rest their weight on their elbows. Signs and symptoms of this disorder may include numbness of the small finger, of the contiguous half of the proximal and middle phalanges of the ring finger, and of the ulnar border of the hand. Treatment concentrates on the prevention of further injury to the ulnar nerve. Therapy may include the use of a doughnut cushion for the elbow to relieve the pressure on the ulnar nerve. Severe cases of this disorder may be corrected by surgical procedures that mobilize and transplant the nerve to a site in front of the medial epicondyle.

target /tär′git/ [OFr, *targuete,* small shield], **1.** any object area subjected to bombardment by radioactive particles or another form of diagnostic or therapeutic radiation. **2.** a device used to contain stable materials and subsequent radioactive materials during bombardment by high-energy nuclei from a cyclotron or other particle accelerator. **3.** the part of the anode struck by electrons in an x-ray tube.

target cell, **1.** an abnormal red blood cell characterized by a densely stained center surrounded by a pale, unstained ring circled by a dark, irregular band. Target cells occur in the blood after splenectomy, in anemia, in hemoglobin C disease, and in thalassemia. Also called **leptocyte.** Compare **discocyte, spherocyte. 2.** any cell having a specific receptor that reacts with a specific hormone, antigen, antibody, antibiotic, sensitized T cell, or other substance.



Target cell *(Patton and Thibodeau, 2010)*



Target cell *(Carr and Rodak, 2008)*

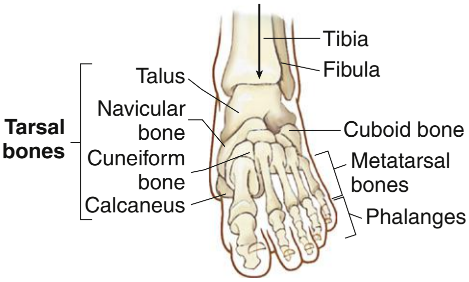
target organ, **1.** an organ intended to receive a therapeutic dose of irradiation, such as the kidney when high-energy x-rays or gamma rays are beamed to the renal area for the treatment of a tumor. **2.** an organ intended to receive the greatest concentration of a diagnostic radioactive tracer, such as the liver, which accumulates 99Tc sulfur colloid when it is injected intravenously to detect hepatic lesions. **3.** an organ most affected by a specific hormone, such as the thyroid gland, which is the target organ of thyroid stimulating hormone secreted by the anterior pituitary gland.

target symptoms, symptoms of an illness that are most likely to respond to a specific treatment, such as a particular psychopharmacological drug.

tarsal /tär′səl/ [Gk, *tarsos,* flat surface], **1.** pertaining to the tarsus, or ankle bone. **2.** relating to the supporting plate of the eyelid.

tarsal arches [Gk, *tarsos,* flat surface; L, *arcus,* rainbow], the superior and inferior branches of the palpebral artery supplying the eyelid.

tarsal bone, any one of seven bones making up the tarsus of the foot, consisting of the talus, calcaneus, cuboid, navicular, and the three cuneiforms.



Tarsal bones *(Patton and Thibodeau, 2010/Yvonne Wylie Walston, used with permission)*

tarsal cartilage. See **tarsus.**

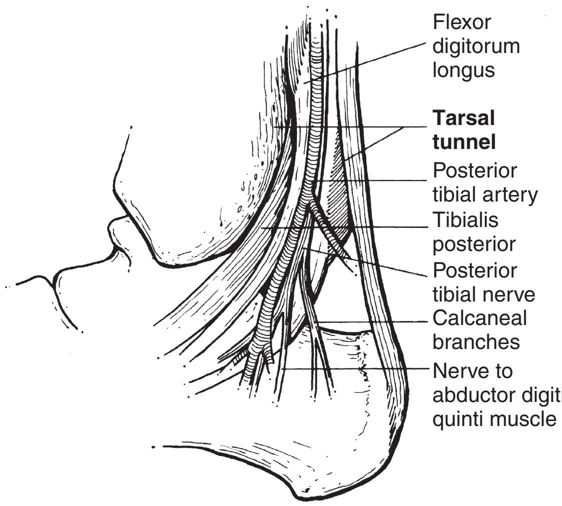
tarsalgia /tärsal′jə/, foot pain, usually involving fallen arches. Also called **podalgia.**

tarsal gland, any one of numerous modified sebaceous glands on the inner surfaces of the eyelids. Acute localized bacterial infection of a tarsal gland may cause a sty or a chalazion. Also called **meibomian gland.** Compare **ciliary gland.**

tarsal plate. See **tarsus.**

tarsal tunnel syndrome, an abnormal condition and a kind of mononeuropathy characterized by pain and numbness in the sole of the foot. This disorder may be caused by fractures of the ankle that compress the posterior tibial nerve. It may be corrected by appropriate orthopedic therapy or surgery.

tarso-, prefix meaning "instep of the foot or the edge of the eyelid": *tarsoclasis, tarsomalacia, tarsometatarsal.*



Tarsal tunnel *(DeLee, Drez, and Miller, 2009)*

tarsometatarsal /tär′sōmet′ətär′səl/ [Gk, *tarsos,* flat surface, *meta,* beyond, *tarsos*], pertaining to the metatarsal bones and the tarsus of the foot, especially the articulations of the metatarsal bones with the cuneiform and cuboid bones at the instep of the foot.

tarsophalangeal reflex. See **Mendel's reflex.**

tarsorrhaphy /tärsôr′əfē/, a surgical procedure for temporarily or permanently uniting the upper and lower eyelids. It usually is performed in procedures to protect the cornea and may involve only the lateral parts of the eyelids.

tarsus /tär′səs/ *pl.* **tarsi** [Gk, *tarsos,* flat surface], **1.** the flat area of articulation between the foot and the leg or the edge of the eyelid. **2.** also called **tarsal cartilage, tarsal plate.** Any one of the fibrous plates of cartilage about 2.5 cm long that form the eyelids. One tarsal plate shapes and gives solidarity to the edge of each eyelid.

TAR syndrome. See **thrombocytopenia-absent radius syndrome.**

tart, abbreviation for the *tartrate carboxylate anion.*

tartar /tär′tär/ [Fr, *tartre*], **1.** See **calculus,** def 2. **2.** any of several compounds containing tartrate, the salt of tartaric acid.

tartaric acid $HOOC(CH_2O)_2COOH$ /tärter′ik/, a colorless or white powder found in various plants and prepared commercially from maleic anhydride and hydrogen peroxide. It is used in baking powder, certain beverages, and tartar emetic.

tartrate /tä′trāt/, **1.** a dianion of tartaric acid. **2.** any salt or ester of tartaric acid.

Tarui's disease /tah′ro͞o·ē/, a form of glycogen storage disease in which abnormally large amounts of glycogen are deposited in the skeletal muscle. The disorder is characterized by hemolysis and cramping on exercise but no rise in blood lactate. Biopsy of the affected organ reveals the absence of the enzyme phosphofructokinase. Also called **glycogen storage disease type VII.** See also **glycogen storage disease.**

-tas, a noun-forming suffix: *fragilitas, graviditas, infertilitas.*

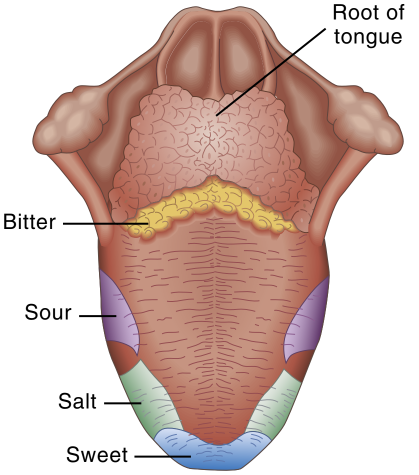
Tasigna, a trademark for **nilotinib.**

task functions, behaviors that focus or direct activities toward movements involving work or labor.

task group, a group in which structured verbal or nonverbal exercises are used to help a person gain emotional, physical, and other personal awareness.

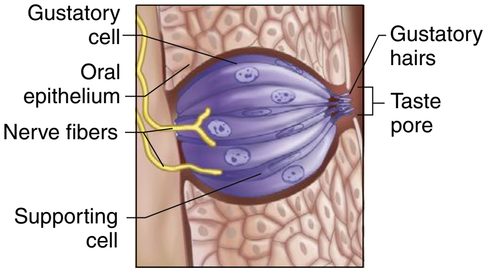
task-oriented behavior, actions involving a person's cognitive abilities in an attempt to solve problems, resolve conflicts, and gratify the person's needs to reduce or avoid distress.

taste [ME, *tasten*], the sense of perceiving different flavors in soluble substances that contact the tongue and trigger nerve impulses to special taste centers in the cortex and thalamus of the brain. The four basic traditional tastes are sweet, salty, sour, and bitter. The front of the tongue is most sensitive to salty and sweet substances; the sides of the tongue are most sensitive to sour substances; and the back of the tongue is most sensitive to bitter substances. The middle of the tongue produces virtually no taste sensation. Chemoreceptor cells in the taste buds of the tongue detect different substances. Adults have about 9000 taste buds, most of them situated on the upper surface of the tongue. The sense of taste is intricately linked with the sense of smell, and taste discrimination is very complex. Many experts believe the capacity to perceive different tastes involves a synthesis of chemoreactive nerve impulses and coordinating brain processes that are still not completely understood.



Taste regions of the tongue
(Thibodeau and Patton, 2007)

taste bud, any one of many peripheral taste organs distributed over the tongue, epiglottis, and the roof of the mouth. The five basic taste sensations registered by chemical stimulation of the taste buds are sweet, sour, bitter, savory, and salty. All other tastes perceived are combinations of these five basic flavors plus the input from olfactory receptors. Each taste bud rests in a spheric pocket, which extends through the epithelium. Gustatory cells and supporting cells form each bud, which has a surface opening and an opening in the basement membrane. Also called **gustatory organ.**



Taste bud *(Patton and Thibodeau, 2010)*

taste papilla [OFr, *taster* + L, *papilla,* nipple], small nipplelike elevations on the tongue. They contain sense organs that are sensitive to the chemicals identified with tastes, which vary with their location on the tongue.

TAT, abbreviation for **tetanus antitoxin.**

tattoo /tato͞o′/ [Tahitian, *tatau,* marks], a permanent coloration of the skin by the introduction of foreign pigment. A tattoo may be created deliberately or may accidentally occur when a bit of graphite from a broken pencil point is embedded in the skin. Laser is preferred for removal of tattoos, although small tattoos can be removed by surgical excision. **—tattoo,** *v.*

tau /tou, tō/, T, τ, the nineteenth letter of the Greek alphabet.

tau protein, a microtubule-associated protein that forms insoluble and hyperphosphorylated aggregates in Alzheimer's disease.

taurine /tôr′in/, a derivative of the amino acid cysteine. It is present in bile in combination with cholic acid. It is used in the synthesis of bile salts.

taurodontism /tô′rō·don′tiz·əm/ [L, *taurus,* bull; Gk, *odous,* tooth], a variation in tooth form characterized by prism-shaped molars with large pulp spaces, resulting from branching of the root only in the middle **(mesotaurodontism),** or in the apical third or not at all **(hypertaurodontism).**

Taussig-Bing syndrome /tô′sig-bing′/ [Helen B. Taussig, American pediatrician, 1898–1986; Richard J. Bing, American cardiologist, 1909–2010], a developmental anomaly of the heart characterized by transposition of the aorta and pulmonary artery. It is accompanied by a subpulmonary ventricular septal defect and ventricular hypertrophy.

tauto-, prefix meaning "same": *tautomenial, tautomeral, tautomerism.*

tautomer /tôtəmər/, structural isomers that differ only in the position of a hydrogen atom or proton. Because tautomers can be rapidly interconverted by proton transfer in aqueous solutions, they are usually in equilibrium with one another. Keto and enol isomers are common examples of tautomers.

Tavist, a trademark for an antihistamine **(clemastine).**

tax-, prefix meaning "order or arrangement": *taxis, taxology, taxonomy.*

-taxia, -taxis, -taxy, suffix meaning "(condition of) internal ordering or arrangement": *acrotaxia, cataxia, diataxia, heterotaxia, prostaxia.* See also **-taxis.**

-taxic. See **-tactic.**

taxis /tak′sis/, **1.** movement away from or toward a stimulus. **2.** the reduction of a hernia. **3.** a dislocation of a hernia by means of manipulation.

-taxis, -taxia, -taxy, **1.** suffix meaning a "(specified) arrangement": *biotaxis, heterotaxis, homotaxis.* **2.** suffix meaning a "movement of an organism in response to a stimulus": *aerotaxis, electrotaxis, geotaxis.* See also **-taxia.**

Taxol, a trademark for an anticancer drug **(paclitaxel).**

taxonomic /tak′sənom′ik/ [Gk, *taxis,* arrangement, *nomos,* law], pertaining to the orderly classification of organisms into appropriate groups, or taxa, on the basis of interrelationships, with the use of suitable names.

taxonomy /takson′əmē/ [Gk, *taxis,* arrangement, *nomos,* rule], a system for classifying organisms according to their natural relationships on the basis of such common factors as embryology, structure, or physiological chemistry. The system has seven main levels, or taxa, each more comprehensive than those below it: kingdom, phylum (or division), class, order, family, genus, and species. Humans are members of the species *Homo sapiens,* of the genus *Homo,* in the family Hominidae in the order Primates, in the class Mammalia, in the phylum Chordata, in the kingdom Animalia. **—taxonomic,** *adj.*

-taxy. See **-taxia, -taxis.**

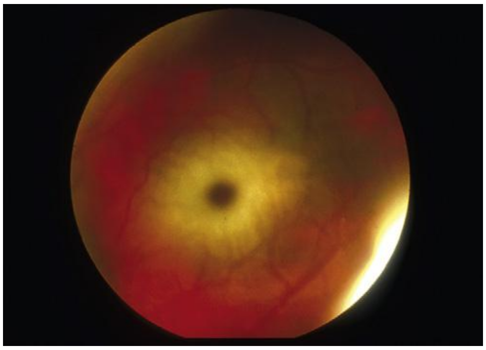
Taylor brace [Charles F. Taylor, American surgeon, 1827–1899], a padded steel brace used to support the spine. Also called **Taylor splint.**

Taylor, Effie J. [1874–1970], a Canadian-born American nurse who was graduated from Johns Hopkins School of Nursing. After graduation she continued at Johns Hopkins at the Phipps Psychiatric Institute, served as a nurse in World War I, and went to Yale University School of Nursing in 1923, succeeding Annie Goodrich as dean in 1934. She served as president of the International Council of Nurses during World War II.

Taylor splint. See **Taylor brace.**

Tay-Sachs disease /tā′saks′/ [Warren Tay, English ophthalmologist, 1843–1927; Bernard Sachs, American neurologist, 1858–1944], an inherited, neurodegenerative disorder of lipid metabolism caused by a deficiency of the enzyme hexosaminidase A, which results in the accumulation of sphingolipids in the brain. The condition, which is transmitted as an autosomal-recessive trait, occurs predominantly in families of Eastern European Jewish origin, specifically the

Ashkenazic Jews. It is characterized by progressive mental and physical retardation and early death. Symptoms first appear by 6 months of age, after which no new skills are learned and there is progressive loss of those skills already acquired. Convulsions and atrophy of the optic nerve head occur after 1 year, followed by blindness, with a cherry-red spot on each retina; spasticity; dementia; and paralysis. Most children die between 2 and 4 years of age. There is no specific therapy for the condition, and intervention is purely symptomatic and supportive. The disease can be diagnosed in utero through amniocentesis. Also called **amaurotic familial idiocy, gangliosidosis type I, infantile cerebral sphingolipidosis, Sachs' disease.** See also **Sandhoff's disease.**



Cherry red spot in Tay-Sachs disease

(Kumar et al, 2010/Courtesy Dr. Thomas A. Weingeist, Department of Ophthalmology & Visual Science, University of Iowa)

Tay's spot. See **cherry red spot.**

tazarotene /tah-zar′o-tēn/, a retinoid prodrug used topically in treatment of acne vulgaris and psoriasis.

Tazicef, a trademark for a cephalosporin antibiotic **(ceftazidime).**

tazobactam /taz′o-bak′tam/, a beta-lactamase inhibitor having antibacterial actions and uses similar to those of sulbactam. It is used as the sodium salt.

Tb, symbol for the element **terbium.**

TB, **1.** abbreviation for **tuberculosis.** **2.** abbreviation for *tubercle bacillus*.

T bandage, a bandage in the shape of the letter T. It is used for the perineum and sometimes for the head. Also called **crucial bandage.**

TBI, **1.** abbreviation for *total body irradiation*. **2.** abbreviation for *traumatic brain injury*.

T-box, a DNA-binding domain shared by a highly conserved family of genes (Tbx genes) that act as transcription factors involved in the regulation of various developmental processes.

T-box genes, a highly conserved family of transcription factors having a common DNA-binding sequence (the T-box), which are important in the regulation of a wide variety of developmental processes in animals.

TBP, **1.** abbreviation for *bithionol*. **2.** abbreviation for *total bypass*.

Tbs, abbreviation for **tablespoon.**

TBSA, abbreviation for *total body surface area*. See **surface area.**

tbsp, abbreviation for **tablespoon.**

TBT, abbreviation for **tracheobronchial tree.**

TBW, abbreviation for **total body water.**

Tc, symbol for the element **technetium.**

TC, abbreviation for **therapeutic community.**

TCA, abbreviation for **tricyclic antidepressant.**

TCDD, abbreviation for **(2,3,7,8-tetrachlorodibenzo-para-dioxin).** See **dioxin.**

T cell, a lymphocyte that participates in cellular immunity, including cell-to-cell communication. The major T cell categories are T-helper and T-suppressor cytotoxic cells. Compare **B cell.** See also **antibody, immune response.** Also called **T lymphocyte.**

T cell antigen receptor, a protein present on T cells that combines with antigens to produce discrete immunological components.

T cell lymphomas, a heterogenous group of lymphoid tumors representing malignant transformation of the T lymphocytes. Some types of tumors formerly included in this group have been found to be mixtures of T cells and B cell precursors.

T cell-mediated hypersensitivity reaction, type IV hypersensitivity reaction. See also **hypersensitivity reaction.**

T cell-mediated immunity. See **cellular immunity, immune response, T cell.**

TCV, abbreviation for **total cell volume.**

Td, abbreviation for **tetanus and diphtheria toxoids.**

TD, **1.** abbreviation for **toxic dose.** **2.** abbreviation for *doubling time*.

TD_{50}, abbreviation for **median toxic dose.**

TDD, abbreviation for **transdermal drug delivery.**

tDNA, abbreviation for **transfer DNA.**

t.d.s., abbreviation for Latin phrase "*ter die sumendum,*" (to be taken) three times a day.

Te, symbol for the element **tellurium.**

tea [Chin, *ch'a*], **1.** a beverage prepared from the leaves and leaf buds of an evergreen shrub, *Thea sinensis*. A member of the camellia family, the plant is grown mainly in Asia. Its pharmacologically active components include caffeine, theobromine, theophylline, and tannin. **2.** maté tea, a caffeine beverage prepared from the leaves of *Ilex paraguayensis*, a shrub grown in South America. **3.** See **cannabis.**

teacher's nodule. See **vocal cord nodule.**

teaching: disease process, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting the patient to understand information related to a specific disease process. See also **Nursing Interventions Classification.**

teaching: foot care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient at risk and/or significant other to provide preventive foot care. See also **Nursing Interventions Classification.**

teaching: group, a nursing intervention from the Nursing Interventions Classification (NIC) defined as development, implementation, and evaluation of a patient teaching program for a group of individuals experiencing the same health condition. See also **Nursing Interventions Classification.**

teaching hospital [AS, *taecan,* to show how], a hospital associated with a university that has accredited programs in various specialties of medical practice.

teaching: individual, a nursing intervention from the Nursing Interventions Classification (NIC) defined as planning, implementation, and evaluation of a teaching program designed to address a patient's particular needs. See also **Nursing Interventions Classification.**

teaching: infant nutrition 0-3 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices through the first three months of life. See also **Nursing Interventions Classification.**

teaching: infant nutrition 4-6 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the fourth month through the sixth month of life. See also **Nursing Interventions Classification.**

teaching: infant nutrition 7-9 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the seventh month through the ninth month of life. See also **Nursing Interventions Classification.**

teaching: infant nutrition 10-12 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the tenth month through the twelfth month of life. See also **Nursing Interventions Classification.**

teaching: infant safety 0-3 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety through the first three months of life. See also **Nursing Interventions Classification.**

teaching: infant safety 4-6 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the fourth month through the sixth month of life. See also **Nursing Interventions Classification.**

teaching: infant safety 7-9 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the seventh month through the ninth month of life. See also **Nursing Interventions Classification.**

teaching: infant safety 10-12 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the tenth month through the twelfth month of life. See also **Nursing Interventions Classification.**

teaching: infant stimulation 0-4 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as teaching parents and caregivers to provide developmentally appropriate sensory activities to promote development and movement through the first four months of life. See also **Nursing Interventions Classification.**

teaching: infant stimulation 5-8 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as teaching parents and caregivers to provide developmentally appropriate sensory activities to promote development and movement from the fifth month through the eighth month of life. See also **Nursing Interventions Classification.**

teaching: infant stimulation 9-12 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as teaching parents and caregivers to provide developmentally appropriate sensory activities to promote development and movement from the ninth month through the twelfth month of life. See also **Nursing Interventions Classification.**

teaching: preoperative, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting a patient to understand and mentally prepare for surgery and the postoperative recovery period. See also **Nursing Interventions Classification.**

teaching: prescribed activity/exercise, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient to achieve and/or maintain a prescribed level of activity. See also **Nursing Interventions Classification.**

teaching: prescribed diet, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient to correctly follow a prescribed diet. See also **Nursing Interventions Classification.**

teaching: prescribed medication, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient to safely take prescribed medications and monitor for their effects. See also **Nursing Interventions Classification.**

teaching: procedure/treatment, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient to understand and mentally prepare for a prescribed procedure or treatment. See also **Nursing Interventions Classification.**

teaching: psychomotor skill, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparing a patient to perform a psychomotor skill. See also **Nursing Interventions Classification.**

teaching rounds, informal conferences held regularly, often at the beginning of the day. Various members of the department and staff may attend, including nurses, residents, interns, students, attending physicians, and faculty. Specific problems in the care of current patients, as well as case presentation of patients with specific diseases, are discussed. See also **nursing rounds.**

teaching: safe sex, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing instruction concerning sexual protection during sexual activity. See also **Nursing Interventions Classification.**

teaching: sexuality, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting individuals to understand physical and psychosocial dimensions of sexual growth and development. See also **Nursing Interventions Classification.**

teaching: toddler nutrition, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices during the second and third years of life. See also **Nursing Interventions Classification.**

teaching: toddler nutrition 13-18 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the thirteenth month through the eighteenth month of life. See also **Nursing Interventions Classification.**

teaching: toddler nutrition 19-24 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the nineteenth month through the twenty-fourth month of life. See also **Nursing Interventions Classification.**

teaching: toddler nutrition 25-36 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on nutrition and feeding practices from the twenty-fifth month through the thirty-sixth month of life. See also **Nursing Interventions Classification.**

teaching: toddler safety 13-18 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the thirteenth month through the eighteenth month of life. See also **Nursing Interventions Classification.**

teaching: toddler safety 19-24 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the nineteenth month through the twenty-fourth month of life. See also **Nursing Interventions Classification.**

teaching: toddler safety 25-36 months, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on safety from the twenty-fifth through the thirty-sixth month of life. See also **Nursing Interventions Classification.**

teaching: toilet training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as instruction on determining the child's readiness and strategies to assist the child to learn independent toileting skills. See also **Nursing Interventions Classification.**

team nursing [AS, *team,* family; L, *nutrix,* nurse], a decentralized system in which the care of a patient is distributed among the members of a group working in coordinated effort. The charge nurse delegates authority to a team leader who must be a professional nurse. This nurse leads the team—usually of 4 to 6 members—in the care of between 15 and 25 patients. The team leader assigns tasks, schedules care, and instructs team members in details of care. A conference is held at the beginning and end of each shift to allow team members to exchange information and the team leader to make changes in the nursing care plan for any patient. Compare **primary nursing.**

team practice, professional practice by a group of professionals that may include physicians, nurses, and others, such as a social worker, nutritionist, or physical therapist, who manage the care of a specified number of patients as a coordinated group, usually in an outpatient setting.

tear /ter/ [ME, *teren,* to rend], to rip, rend, or pull apart by force.

teardrop fracture /tir′drop/ [AS, *tear* + *dropa* + L, *fractura,* break], an avulsion fracture of one of the short bones, such as a vertebra, causing a tear-shaped disruption of bone tissue.

tear duct /tir/ [AS, *tear* + L, *ducere,* to lead], any duct that carries tears, including the lacrimal ducts, nasolacrimal ducts, and excretory ducts of the lacrimal glands.

tear gas /tēr/, a gas that produces severe lacrimation by irritating the conjunctivae.

tearing /tir′ing/, watering of the eye usually caused by excessive tear production, resulting from strong emotion, infection, or mechanic irritation by a foreign body. If the normal amount of fluid tears is produced but not drained into the lacrimal punctum at the nasal border of the eye, tear overflow will occur. If the lacrimal punctum, sac, canaliculi, or nasolacrimal duct becomes blocked, tears also will overflow. Also called **epiphora.**

tears /tirz/ [ME, *tere*], a watery saline or alkaline fluid secreted by the lacrimal glands that, along with secretions from the meibomian glands and goblet cells and glands of Zeii, moisten the conjunctiva and cornea. Also called **dacryon.**

tears of the perineum /ters/ [ME, *teren* + Gk, *perineos*], a rending of the tissues between the vulva and anus caused by overstretching of the vagina during child delivery. The degree of damage ranges from a tear of the superficial tissues without injury to the surrounding muscle to a rupture of the perineal skin, vaginal and rectal mucosa, and anal sphincter. The damage is usually repaired by surgery.

teaspoon (tsp), a small spoon that may be used to measure a dose of a liquid medication, equivalent to about 1 fluid dram or 5 mL.

tea tree oil, an herbal product taken from a species of myrtle tree native to coastal Australia.

■ USES: This herb is used topically for acne and fungal infections and has proven efficacy. It has also been added to warm bath water and inhaled for treatment of cough and lower respiratory disorders, but there are no reliable data regarding its efficacy in this instance.

■ CONTRAINDICATIONS: This herb should not be used during pregnancy and lactation or in those with known hypersensitivity to this plant. Tea tree oil has been taken orally in the past, but this is not recommended due to safety concerns.

tebutate, a contraction for tertiary butyl acetate.

technetium (Tc) [Gk, *technectos,* artificial], a radioactive, metallic element. Its atomic number is 43, and its atomic mass is 99. The first synthetic element, technetium also occurs in nature. Isotopes of technetium are used in radioisotope scanning procedures of internal organs such as the liver and spleen.

technetium-99m, the radionuclide most commonly used to image the body in nuclear medicine scans. It is preferred because of its short half-life and because the emitted photon has an appropriate energy for normal imaging techniques. The "m" indicates that this radionuclide is metastable. It is generated on site from a molybdenum source.

technic. See **technique.**

-technic, -technics, -technique, -technology, -techny, suffix meaning "skillful way or the mechanics of doing something": *mnemotechnics, zymo-technique.*

technical [Gk, *technikos,* skillful], pertaining to a procedure or its results that require special techniques, skills, expertise, or knowledge.

technician /teknish′ən/ [Gk, *technikos,* skillful], a person with special training and experience in some form of technical procedures, usually those involving mechanical adjustments, such as maintaining and operating radiological equipment.

-technics. See **-technic.**

technique /teknēk′/ [Gk, *technikos,* skillful], the method and details followed in performing a procedure, such as those used in conducting a laboratory test, a physical examination, a psychiatric interview, a surgical operation, or any process requiring certain skills or an ordered sequence of actions. Also spelled **technic.**

-technique. See **-technic.**

techno-, prefix meaning "art": *technocausis, technology, technopsychology.*

technologist /teknol′əjist/ [Gk, *techne,* art, *logos,* science], a person who studies the application of processes for making natural resources beneficial for humans. A medical technologist may work under the supervision of a physician in general clinical laboratory procedures.

-technology. See **-technic.**

technology /teknol′əjē/ [Gk, *techne,* art, *logos,* study], **1.** the application of science or the scientific method to commercial or industrial objectives. **2.** the knowledge and use of science applied to the conversion of natural resources for the benefit of humans.

technology management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of technical equipment and devices to monitor patient condition or sustain life. See also **Nursing Interventions Classification.**

-techny. See **-technic.**

tecto-, prefix meaning "rooflike": *tectocephalic, tectorial, tectum.*

tectonic /tekton′ik/, **1.** pertaining to variations in structure in the cornea or other parts of the eye. **2.** pertaining to plastic surgery or tissue transplants.

tectorial /tektôr′ē·əl/, pertaining to a rooflike structure or cover.

tectorium /tektôr′ē·əm/, a body structure that serves as an overlying structure or roof.

TED, **1.** abbreviation for *threshold erythema dose.* See **threshold dose. 2.** abbreviation for *thromboembolic disorder.* See **thromboembolic disorder hose.**

teenager. See **adolescent.**

teeth. See **tooth.**

teethe. See **teething.**

teether /tē′ther/, an object such as a plastic or rubber teething ring on which an infant can bite or chew during the teething process. Also called **teething ring.**

teething /tē′thing/ [AS, *toth*], the physiological process of the eruption of the primary teeth through the gums. It normally begins around the sixth month of life and occurs periodically until the complete set of 20 teeth has appeared at about 30 to 36 months. Discomfort and inflammation result from the pressure exerted against the periodontal tissue as the crown of the tooth breaks through the membranes. General signs of teething include excessive drooling, biting on hard objects, irritability, difficulty in sleeping, and refusal of food. Low grade fever or diarrhea often occurs during teething but may be indicative of illness rather than of teething. The pain and inflammation usually may be soothed by cold, such as with a frozen teething ring, cold metal spoon, or ice wrapped in a washcloth. Use of teething powders and procedures such as rubbing or cutting the gums are discouraged because of the possibility of infection or complications from ingestion of the medication. **—teethe,** *v.*

teething ring. See **teether.**

Teflon, a trademark for a substance (polytetrafluoroethylene) used for the construction of surgical implants in restorative surgery and the coating of surgical blades.

teg-, prefix meaning “a cover”: *tegmen, tegmental, tegument.*

tegaserod, a 5-HT4 receptor partial agonist used to treat irritable bowel syndrome when the primary bowel symptom is constipation.

tegmen /teg′mən/, a covering, such as the bone that covers the tympanic cavity.

tegmental /tegmen′təl/ [L, *tegmentum,* cover], of or relating to an integument.

Tegretol, a trademark for an analgesic and anticonvulsant **(carbamazepine).**

TEIB, abbreviation for *triethylene-immunobenzoquinone.*

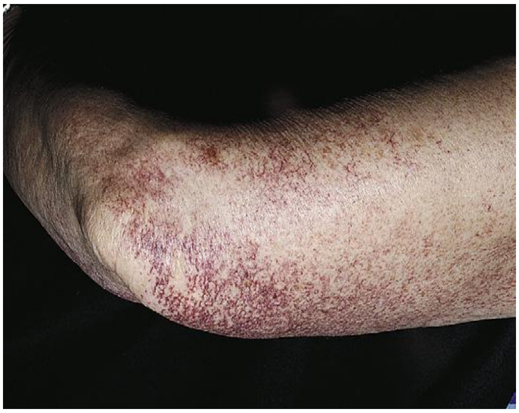
teicoplanin /ti-ko-pla′nin/, a glycopeptide antibiotic produced by the bacterium *Actinoplanes teichomyceticus,* used as a less toxic alternative to vancomycin in the treatment of moderate to severe infections caused by gram-positive bacteria when other antibiotics cannot be used.

Tekturna, a trademark for **aliskiren.**

tela-, prefix meaning “a web or weblike structure”: *telalgia, telangiectasia, telangitis.*

-tela, suffix meaning a “weblike membrane”: *aulatela, epitela, metatela.*

telangiectasia /təlan′jē·ektā′zhə/ [Gk, *telos,* end, *angeion,* vessel, *ektasis,* swelling], permanent dilation of groups of superficial capillaries and venules. Common causes are actinic damage, atrophy-producing dermatoses, rosacea, elevated estrogen levels, and collagen vascular diseases. See also **Osler-Weber-Rendu syndrome, spider angioma.**



Telangiectasia *(Callen et al, 2000)*

telangiectasia lymphatica [Gk, *telos,* end, *angeion,* vessel, *ektasis,* swelling; L, *lympha,* water], a congenital or acquired condition of obstructed dilated lymphatic vessels resulting in lymphangiomas.

telangiectatic angioma /təlan′jē·ektat′ik/, a tumor composed of dilated blood vessels.

telangiectatic epulis, a benign red tumor of the gingiva containing prominent blood vessels. Low-grade or chronic irritation is a risk factor.

telangiectatic fibroma. See **angiofibroma.**

telangiectatic glioma, a tumor composed of glial cells and a network of blood vessels, which give the mass a vivid pink appearance.

telangiectatic granuloma. See **pyogenic granuloma.**

telangiectatic lipoma. See **angiolipoma.**

telangiectatic nevus, a common skin condition of neonates, characterized by flat, deep-pink localized areas of capillary dilation that occur predominantly on the back of the neck, lower occiput, upper eyelids, upper lip, and bridge of the nose. The areas disappear permanently by about 2 years of age. Also called **capillary flames, stork bite.** Compare **superficial fading infantile hemangioma.**

telangiectatic sarcoma, a malignant tumor of mesodermal cells with an unusually rich vascular network.

telbivudine, an antiretroviral.

■ INDICATION: This drug is used in the treatment of hepatitis B.

■ CONTRAINDICATIONS: Lactation and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include weakness, taste change, hearing loss, photophobia, abdominal pain, hepatomegaly, lactic acidosis, myalgia, arthralgia, muscle cramps, and cough. Common side effects include fever, headache, malaise, dizziness, insomnia, nausea, vomiting, diarrhea, anorexia, and rash.

tele-, teleo-, prefix meaning “end or occurring at a distance”: *telekinesis, telosynapsis.*

telediagnosis /tel′ədī′əgnō′sis/ [Gk, *tele,* far off, *dia,* through, *gnosis,* knowledge], a process whereby a disease diagnosis, or prognosis, is made by the electronic transmission of data between distant medical facilities.

telehealth, the use of telecommunication technologies to provide health care services and access to medical and surgical information for training and educating health care professionals and consumers, to increase awareness and educate the public about health-related issues, and to facilitate medical research across distances.

telekinesis /tel′əkinē′sis/ [Gk, *tele,* far off, *kinesis,* movement], a concept of parapsychology that one can control external events such as the movement of a solid object by the powers of the mind. For example, practitioners of telekinesis may believe it possible, by thought processes alone, to influence the roll of dice. Also called **parakinesis, psychokinesis.**

telemedicine, the use of telecommunication equipment and information technology to provide clinical care to individuals at distant sites and the transmission of medical and surgical information and images needed to provide that care.

telemetry /telem′ətrē/ [Gk, *tele,* far off, *metron,* measure], the electronic transmission of data between distant points, such as the transmission of cardiac monitoring data.

telencephalization /tel′ensef′əlīzā′shən/, a stage in fetal development in which the forebrain begins to assume control over nervous system functions previously directed by more primitive neural centers. Also called **corticalization.**

telencephalon /tel′ensef′əlon/ [Gk, *telos*, end, *egekephalos*, brain], the paired brain vesicles or endbrain from which the cerebral hemispheres are derived.

teleo-. See **tele-.**

teleology /tel′ē·ol′əjē/ [Gk, *telos*, end, *logos*, science], **1.** the study of ultimate purpose or design in natural phenomena. **2.** a theory that everything is directed toward some final purpose.

telepathic, the ability or perceived ability to communicate using the mind only. See **telepathy.**

telepathist /təlep′əthist/, **1.** a person who believes in telepathy. **2.** a person who claims to have telepathic powers.

telepathy /təlep′əthē/ [Gk, *tele*, far off, *pathos*, feeling], the alleged communication of thought from one person to another by means other than the physical senses. Also called **thought transference.** See also **clairvoyance, extrasensory perception, parapsychology. —telepathic,** *adj.*, **telepathize,** *v.*

telephone consultation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as eliciting a patient's concerns, listening, and providing support, information, or teaching in response to the patient's stated concerns, over the telephone. See also **Nursing Interventions Classification.**

telephone counseling, a strategy system to provide support by telephone for patients or family caregivers who are homebound. The system may offer safety provisions and social contacts for frail older persons or the visually impaired as well as suicide-prevention counseling.

telephone follow-up, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing results of testing or evaluating a patient's response and determining potential for problems as a result of previous treatment, examination, or testing, over the telephone. See also **Nursing Interventions Classification.**

teleradiology /tel′ĕ-ra′de-ol′ah-je/, radiology done through remote transmission and viewing of images.

telereceptive /tel′ərisep′tiv/, pertaining to the exteroceptors of hearing, sight, and smell that detect stimuli distant from the body.

teletherapy /tel′əther′əpē/ [Gk, *tele* + *therapeia*, treatment], radiation therapy administered by a machine that is positioned at some distance from the patient. Typically a teletherapy unit can rotate around a patient, thus allowing the use of multiple beams that intersect at the tumor and lowering the dose to surrounding normal tissue.

telithromycin, an antiinfective.

■ INDICATIONS: This drug is used to treat acute bacterial exacerbation of chronic bronchitis caused by *Streptococcus pneumoniae, Haemophilus influenzae,* and *Moraxella catarrhalis;* acute bacterial sinusitis caused by *S. pneumoniae, H. influenzae, M catarrhalis,* and *Staphylococcus aureus;* and community-acquired pneumonia.

telluric /telo͞o′rik/ [L, *tellus*, earth], pertaining to the soil and its possible pathogenic influence.

tellurium (Te) /telo͞o′rē·əm/ [L, *tellus*, earth], an element exhibiting metallic and nonmetallic chemical properties. Its atomic number is 52; its atomic mass is 127.60. Inhaling vapors of tellurium results in a garlicky breath.

telmisartan, an antihypertensive.

■ INDICATIONS: This drug is used to treat hypertension, either alone or in combination with other drugs.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of telmisartan include dizziness, insomnia, dyspepsia, and cough. Common side effects include anxiety, diarrhea, anorexia, vomiting, myalgia, pain, and upper respiratory infection.

telo-, prefix meaning "end": *telobiosis, telodendron, telosynapsis.*

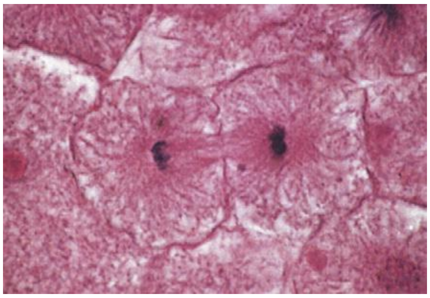
telocentric /tel′əsen′trik/ [Gk, *telos*, end, *kentron*, center], pertaining to a chromosome in which the centromere is located at the end so that the chromosome appears as a straight filament. Compare **acrocentric, metacentric, submetacentric.**

telogen. See **hair.**

telomerase /tə·lō′mər·ās/, a DNA polymerase involved in the formation of telomeres and the maintenance of telomere sequences during replication.

telomere /tel′ō·mēr/, either of the ends of a chromosome, which possess special properties, among them a polarity that prevents their reunion with any fragment after a chromosome has been broken.

telophase /tel′əfāz/ [Gk, *telos* + *phasis*, appearance], the final of the four stages of nuclear division in mitosis and in each of the two divisions in meiosis. The newly produced daughter chromosomes from the preceding stage (anaphase) assemble at the poles of the spindle and become long and slender, the nuclear membrane forms around them, the nucleolus reappears, and the cytoplasm begins to divide. See also **anaphase, interphase, meiosis, metaphase, mitosis, prophase.**



Telophase *(© Ed Reschke; used with permission)*

Temaril, a trademark for an antihistamine (trimeprazine tartrate).

temazepam /temaz′əpam/, a benzodiazepine hypnotic agent.

■ INDICATIONS: It is prescribed for the relief of transient and intermittent insomnia.

■ CONTRAINDICATIONS: Pregnancy or lactation prohibits its use. It is not recommended for patients under 18 years of age. Patients should avoid use of alcohol while also using temazepam.

■ ADVERSE EFFECTS: The most serious adverse effects are confusion, euphoria, anorexia, ataxia, palpitations, hallucinations, horizontal nystagmus, and paradoxic reactions.

Temovate, a trademark for a topical corticosteroid **(clobetasol propionate).**

temozolomide, a miscellaneous antineoplastic agent.

■ INDICATION: It is used to treat anaplastic astrocytoma with relapse.

■ CONTRAINDICATIONS: Pregnancy, lactation, and known hypersensitivity to this drug or to carbazine prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are thrombocytopenia, leukopenia, and seizures. Other adverse effects include anemia, urinary incontinence, urinary tract infection, urinary frequency, upper respiratory infection, pharyngitis, sinusitis, cough, headache, fatigue, asthenia, fever, edema, back pain, weight increase, and diplopia. Common side effects include nausea, anorexia, vomiting, hemiparesis, dizziness, poor coordination, amnesia, insomnia, paresthesia, somnolence, paresis, ataxia, anxiety, dysphagia, depression, confusion, rash, and pruritus.

temper [L, *temperare,* to moderate], **1.** *v*, to moderate or soften the effects. **2.** *n*, a state of mind regarding calmness or anger.

temperament /temp′(ə)rəmənt/ [L, *temperamentum,* mixture in proper proportions], the features of a persona that reflect an individual's emotional disposition, or the way he or she behaves, feels, and thinks.

temperance /tem′pərəns/, behavior that emphasizes moderation and self-restraint, particularly in the use of alcohol.

temperate phage /tem′pərit/ [L, *temperare,* to moderate; Gk, *phagein,* to eat], a bacteriophage whose genome is incorporated into the host bacterium. It persists through many cell divisions of the bacterium without destroying the host, in contrast to a virulent phage, which lyses and kills its host.

temperature (T) /tem′pə(ri)chər/ [L, *temperatura*], **1.** a relative measure of sensible heat or cold. **2.** (in physiology) a measure of sensible heat associated with the metabolism of the human body, normally maintained at a constant level of 98.6° F (37° C) by the thermotaxic nerve mechanism that balances heat gains and heat losses. **3.** *(informal)* a fever.

temperature of infant [L, *temperatura* + *infans,* infant], the neonatal temperature, which normally ranges from 97.7° F to 99.5° F (36.5° C to 37.5° C). It is unstable because of immature physiological mechanisms.

temperature regulation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as attaining and/or maintaining body temperature within a normal range. See also **Nursing Interventions Classification.**

temperature regulation: intraoperative, a nursing intervention from the Nursing Interventions Classification (NIC) defined as attaining and/or maintaining desired intraoperative body temperature. See also **Nursing Interventions Classification.**

temperature scale, a scale for expressing degree of heat, based on absolute zero as a reference point, or with a certain value arbitrarily assigned to such temperatures as the freezing point and boiling point of water.

temperature sense. See **thermic sense.**

temper tantrum. See **tantrum.**

template /tem′plit/ [L, *templum,* section], the strand of DNA that acts as a model for the synthesis of messenger RNA. The messenger RNA contains a complementary sequence of nucleotides and travels to the ribosomes, which are located in the cytoplasm, for the synthesis of proteins.

template bleeding time test. See **simplate bleeding time test.**

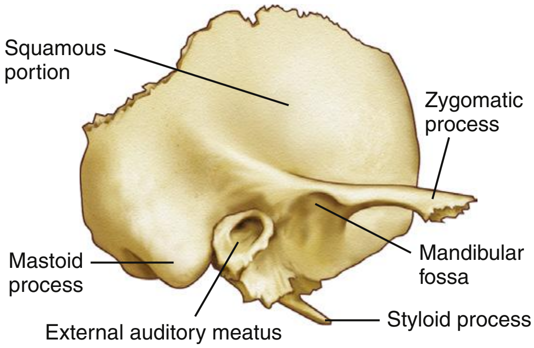
tempo-, **1.** combining form meaning "time": *tempolabile, temporal, tempostabile*. **2.** combining form meaning "the temples, in the lateral regions of the head": *temporal, temporalis, temporomandibular.*

temporal /tem′pərəl/ [L, *tempus,* time; *tempora,* the temples], **1.** pertaining to a limited time. **2.** relating to the temple of the skull. **3.** pertaining to the temporal bone of the skull.

temporal arteritis [L, *temporalis,* temporary, *arteria,* airpipe, *itis,* inflammation], a progressive inflammatory disorder of cranial blood vessels, principally the temporal artery. It occurs most frequently in women over 70 years of age. Characteristic changes in the involved vessels include granulomatous disruption of the elastic layer and engulfment of fiber fragments by giant cells in the intimal and medial layers. The temporal artery is typically tender, swollen, and pulseless but may be clinically normal. Symptoms are intractable headache, difficulty in chewing, weakness, rheumatic pains, and loss of vision if the central retinal artery becomes occluded. Also called **cranial arteritis, giant cell arteritis, Horton's arteritis.**

temporal artery, any one of three arteries on each side of the head: the superficial temporal artery, the middle temporal artery, and the deep temporal artery.

temporal bone, one of a pair of large bones forming part of the lower cranium and containing various cavities and recesses associated with the ear, such as the tympanic cavity and the auditory tube. Each temporal bone consists of four parts: the mastoid, the squama, the petrous, and the tympanic.



Temporal bone

temporal bone fracture, a break in the temporal bone of the skull, sometimes characterized by bleeding from the ear. Diminished hearing, facial paralysis, or infection of the tympanic cavity leading to meningitis may occur.

temporal fascia, a tough fan-shaped aponeurosis overlying the temporalis muscle and attached by its outer margin to the superior temporal line and by its inferior margin to the zygomatic arch.

temporal fossa, a narrow fan-shaped space that covers the lateral surface of the skull. The major structure in the temporal fossa is the temporalis muscle. Also passing through the fossa are the zygomaticotemporal branches of the maxillary nerve.

temporal gyrus, any of three convolutions, inferior, middle, or superior, on the lateral surface of the temporal lobe of the brain.

temporalis /tem′pəral′is/, one of the four muscles of mastication. It is a broad radiating muscle that acts to close the jaws and retract the mandible. Also called **temporal muscle.** Compare **external pterygoid muscle, internal pterygoid muscle, masseter.**

temporal lobe, the lateral region of the cerebrum, below the lateral fissure. Within the temporal lobe of the brain is the center for smell and some association areas for memory and learning. Compare **frontal lobe, occipital lobe, parietal lobe.**

temporal lobe epilepsy, seizures that arise from the temporal lobe, often associated with mesial sclerosis. Patients may have an aura before these kinds of seizures.

temporal muscle. See **temporalis.**

temporal process, the posterior blunt process of the zygomatic bone that articulates with the zygomatic process of the temporal bone to form the zygomatic arch.

temporal subtraction, the subtraction of two or more digitized x-ray images that were acquired at different times. The subtraction process eliminates information in the image that was static. If contrast material is introduced into the organ during the period between two image acquisitions, the subtracted image will show only the space filled with the contrast material.

temporal summation. See **summation,** def. 2.

temporary absence. See **conditional discharge.**

temporary base. See **baseplate.**

temporary filling, a short-term use material which can restore missing tooth structure until such time as definitive treatment of the tooth is possible. It may incorporate sedative materials for pulpal pain.

temporary pacemaker /tem′pərer′ē/ [L, *temporalis,* temporary, *passus,* step; ME, *maken*], an electronic pacemaker used as an interim treatment when the heart rate is excessively low. It consists of either a pulse generator and battery attached outside the patient's body and connected to a transvenous electrode in the right ventricle or conductive pads placed on the chest and connected to an external pulse generator by cables.

temporary prosthesis. See **preparatory prosthesis.**

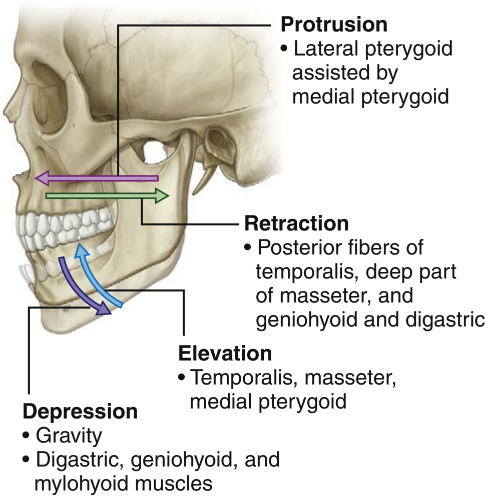
temporary removable splint [L, *temporalis,* temporary, *remover* + D, *splint*], any of a variety of dental appliances, including occlusal splints, used when limited stability of the teeth is required. It may be placed on or removed from teeth at will. Examples include Haley's orthodontic appliance and Elbrecht's cast metal splint.

temporary stopping [L, *temporalis* + AS, *stoppian,* to stop up], a mixture of gutta-percha, zinc oxide, white wax, and coloring, used for temporarily sealing dressings in tooth cavities. It softens on heating and rehardens at room temperature but is not hard enough to be used effectively long term in tooth areas under occlusal stress. Compare **sedative filling, temporary filling.**

temporary tooth. See **primary dentition.**

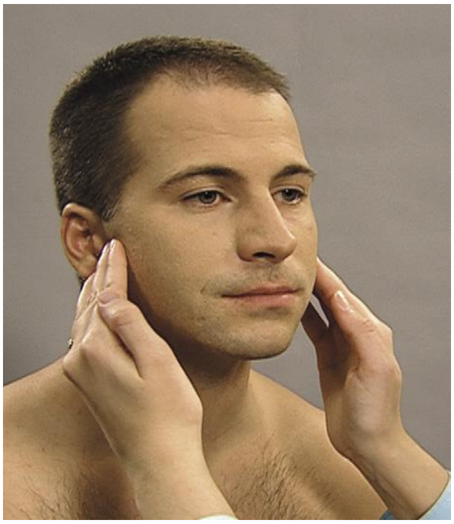
temporomandibular /tem′pərō′mandib′yələr/ [L, *tempora,* the temples, *mandere,* to chew], pertaining to the articulation between the temporal bone and the condyle of the mandible.

temporomandibular joint (TMJ) [L, *tempora* + *mandere,* to chew, *jungere,* to join], one of a pair of joints connecting the mandible of the jaw to the temporal bone of the skull. It is a combined hinge and gliding joint, formed by the anterior parts of the mandibular fossae of the temporal bone, the articular eminences, the condyles of the mandible, and five ligaments. The TMJ is the only joint in the body in which movement of one joint is always synchronous with movement of the other joint.



Protrusion
• Lateral pterygoid assisted by medial pterygoid
Retraction
• Posterior fibers of temporalis, deep part of masseter, and geniohyoid and digastric
Elevation
• Temporalis, masseter, medial pterygoid
Depression
• Gravity
• Digastric, geniohyoid, and mylohyoid muscles

Temporomandibular joint
(Drake, Vogl, and Mitchell, 2010)



Palpation of the temporomandibular joint
(Seidel et al, 2011)

temporomandibular joint capsule, a fibrous protective sheath enclosing the temporomandibular joint of the lower jaw.

temporomandibular joint (TMJ) disorder, dysfunction of the temporomandibular joint, marked by a clicking or grinding sensation in the joint and often by pain in or about the ears, tinnitus, tiredness, slight soreness of the jaw muscles on waking, and stiffness of the jaw or actual trismus. Numerous causes have been proposed, such as mandibular overclosure, stress, and lesions of the joint. Also called **TMJ disorder.**

temporomandibular joint (TMJ) pain dysfunction syndrome, an abnormal condition characterized by facial pain and mandibular dysfunction, apparently caused by a defective or dislocated temporomandibular joint. Some common indications of this syndrome are clicking of the joint when the jaws move, limitation of jaw movement, subluxation, and temporomandibular dislocation.

temporomandibular ligament [L, *temporalis* + *mandere,* to chew, *ligare,* to bind], an oblique band of connective tissue that extends downward and backward from the zygomatic process to the neck of the mandible.

temporomaxillary /-mak′siler′ē/, pertaining to the area of the temporal and maxillary bones.

temporooccipital /tem′pərō·oksip′itəl/, pertaining to the area of the temporal and occipital bones.

temporoparietal. See **parietotemporal.**

temporoparietalis /tem′pərōpərī′ətal′is/ [L, *temporalis* + *paries,* wall], one of a pair of broad, thin muscles of the scalp, which are divided into three parts that fan out over the temporal fascia and insert into the galea aponeurotica. The three parts include an anterior temporal part; a superior parietal part; and, in between, a triangular part. On both sides it acts in combination with the occipitofrontalis to wrinkle the forehead, widen the eyes, and raise the ears. It is innervated by branches of the facial nerve. Compare **occipitofrontalis.**

temsirolimus, a biological response modifier.

■ INDICATION: This drug is used to treat renal cell carcinoma.

■ CONTRAINDICATIONS: Breastfeeding, pregnancy, and known hypersensitivity to this drug, sirolimus, or polysorbate 80 prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include seizures, hypertension, hypertriglyceridemia, hyperlipidemia, hyperglycemia, nausea, vomiting, diarrhea, constipation, pruritus, and metabolic acidosis. Life-threatening side effects include thrombophlebitis, bowel perforation, albuminuria, hematuria, proteinuria, renal failure, anemia, leukopenia, thrombocytopenia, interstitial lung disease, and lymphoma. Common side effects include headache and rash.

TEN, abbreviation for **toxic epidermal necrolysis.**

tenacious /tenā′shəs/ [L, *tenax,* holding fast], pertaining to secretions that are sticky or adhesive or otherwise tend to hold together, such as mucus and sputum.

tenacity /tenas′itē/ [L, *tenax,* holding fast], the ability to be persistent or remain attached.

tenaculum /tənak′yələm/ *pl.* **tenacula** [L, holder], a clip or clamp with long handles used to grasp, immobilize, and hold an organ or a piece of tissue. Kinds of tenacula include the **abdominal tenaculum,** which has long arms and small hooks; the **forceps tenaculum,** which has long hooks and is used in gynecological surgery; and the **uterine** or **cervical tenaculum,** which has short hooks or open, eye-shaped clamps used to hold the cervix.

tenalgia /tenal′jə/, pain referred to a tendon. Also called **tenodynia.**

tender, responding with a sensation of pain to pressure or touch that would not normally cause discomfort.

tendinitis /ten′dənī′tis/ [L, *tendere,* to stretch; Gk, *itis,* inflammation], inflammation of a tendon, usually resulting from strain. Treatment may include rest, corticosteroid injections, application of ice or heat, and support. Also spelled **tendonitis.**

tendino-. See **teno-.**

tendinous. See **tendon.**

tendinous arch, a linear thickening in the fascia covering the obturator internus muscle that is part of the attachment of the levator ani muscles to the pelvic wall.

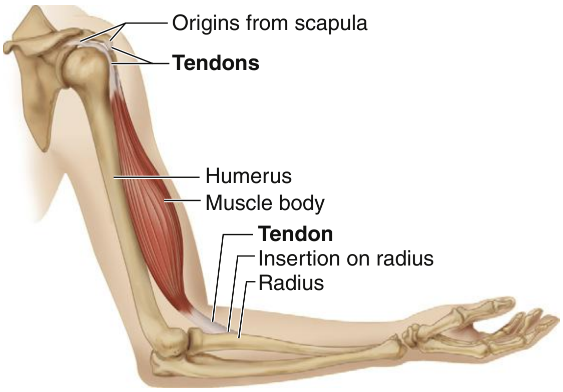
tendinous cords, the strands of tendon that anchor the cusps of the mitral and tricuspid valves to the papillary muscles of the ventricles of the heart, preventing prolapse of the valves into the atria during ventricular contraction. Also called **chordae tendineae.**

tendo /ten′dō/, a tendon, such as the tendo calcaneus, the Achilles tendon.

tendo-. See **teno-.**

tendo calcaneus. See **Achilles tendon.**

tendon /ten′dən/ [Gk, *tenon*], any one of many white, glistening bands of dense fibrous connective tissue that attach muscle to bone. Except at points of attachment, tendons are parallel bundles of collagenous fibers sheathed in delicate fibroelastic connective tissue. Larger tendons contain a thin internal septum, a few blood vessels, and specialized stereognostic nerves. Tendons are extremely strong, flexible, and inelastic and occur in various lengths and thicknesses. Compare **ligament. —tendinous,** *adj.*



Tendon *(Patton and Thibodeau, 2010)*

tendon graft, a free graft of tendon used to replace a damaged tendon segment.

tendonitis. See **tendinitis.**

tendon of Achilles. See **Achilles tendon.**

tendon reflex. See **deep tendon reflex.**

tendosynovitis. See **tenosynovitis.**

tenecteplase /tĕ-nek′tĕ-plās/, a modified form of human tissue plasminogen activator produced by recombinant DNA technology; used as a thrombolytic agent in the treatment of myocardial infarction; administered intravenously.

tenesmic /tənez′mik/ [Gk, *tenedere,* to stretch], pertaining to or resembling tenesmus.

tenesmus /tənez′məs/ [Gk, *tendere,* to stretch], persistent, ineffectual spasms of the rectum or bladder, accompanied by the desire to empty the bowel or bladder, or ineffectual straining to evacuate the bowel or bladder. Intestinal tenesmus is a common complaint in inflammatory bowel disease and irritable bowel syndrome. **—tenesmic,** *adj.*

tenia /tē′nē·ə/, **1.** any anatomical bandlike structure, such as a band of muscle fibers. **2.** a bandage or tape.

tenia-, taenia-, combining form meaning "ribbon, band": *taeniasis, teniafuge, taenidium.*

teniasis /tēnī′əsis/, an infection of intestinal tapeworms of the genus *Taenia.*

tenia terminalis. See **terminal crest.**

tennis elbow. See **lateral humeral epicondylitis.**

teno-, tenonto-, tendo-, tendino-, prefix meaning "tendon": *tenodesis, tenodynia, tenomyotomy.*

tenodesis splint /tənod′əsis, ten′ōdē′sis/, the fixation of a tendon, sometimes performed by suturing one of its ends to a different point.

tenodynia. See **tenalgia.**

tenofibril. See **tonofibril.**

tenofovir, an antiretroviral agent.

■ INDICATIONS: This drug is prescribed to treat HIV-1 infection with other antiretrovirals.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Common adverse effects include headache, nausea, vomiting, diarrhea, flatulence, and abdominal pain.

tenofovir disoproxil fumarate, a prodrug of tenofovir, used in the treatment of HIV-1 (human immunodeficiency virus-1) infection.

Tenon's capsule, a thin membranous socket that envelops the eyeball from the optic nerve to the ciliary region and allows it to move freely. Tenon's capsule has a smooth inner surface, pierced by vessels and nerves, and fuses with the sheath of the optic nerve and with the sclera. The lower part of the membrane thickens into the suspensory ligament, which attaches to the zygomatic arch and the lacrimal bones. Also called **fascia bulbi.**

tenonto-. See **teno-.**

tenophony /tenof′ənē/, a heart murmur associated with a defect in the chordae tendineae.

Tenormin, a trademark for a beta-blocker **(atenolol).**

tenosynovitis /ten′ōsin′əvī′tis/ [Gk, *tenon,* tendon, *syn,* together; L, *ovum,* egg; Gk, *itis*], inflammation of a tendon sheath caused by calcium deposits, repeated strain or trauma, high levels of blood cholesterol, rheumatoid arthritis, gout, or gonorrhea. In some instances, movement causes a crackling noise over the tendon. Most cases not associated with systemic disease respond to rest. Local injections of corticosteroids may provide relief; surgery is indicated if the condition persists. Also called **tendosynovitis.**

tenotomy /tenot′əmē/ [Gk, *tenon,* tendon, *temnein,* to cut], the total or partial severing of a tendon, performed to correct a muscle imbalance, such as in the correction of strabismus of the eye or in clubfoot.

TENS, abbreviation for **transcutaneous electrical nerve stimulation.**

Tensilon, a trademark for an anticholinesterase drug (edrophonium).

Tensilon test, a diagnostic technique for verifying the signs of myasthenia gravis by testing the power of skeletal muscles before and after injection of edrophonium hydrochloride.

tensiometer /ten′sē·om′ətər/ [L, *tendere,* to stretch; Gk, *metron,* measure], a device for measuring the surface tension of a liquid.

tension /ten′shən/ [L, *tendere,* to stretch], **1.** the act of pulling or straining until taut. **2.** the condition of being taut, tense, or under pressure. **3.** a state or condition resulting from the psychological and physiological reaction to a stressful situation. It is characterized physically by a general increase in muscle tonus, heart rate, respiration rate, and alertness and psychologically by feelings of strain, uneasiness, irritability, and anxiety. See also **stress.**

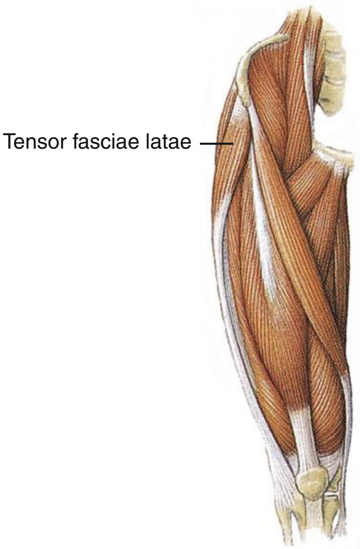
tension headache, a pain that affects the head as the result of overwork or emotional strain and that involves tension in the muscles of the neck, face, and shoulder.

tension lines, cleavage lines.

tension pneumothorax [L, *tendere,* to stretch; Gk, *pneuma,* air, *thorax*], the presence of air in the pleural space when pleural pressure exceeds alveolar pressure, caused by a rupture through the chest wall or lung parenchyma associated with the valvular opening. Air passes through the valve during coughing but cannot escape on exhalation. Unrelieved pneumothorax can lead to respiratory arrest.

tensor /ten′sər/ [L, *tendere,* to stretch], any one of the muscles of the body that tenses a structure, such as the tensor fasciae latae of the thigh. Compare **abductor, adductor, depressor, sphincter.**

tensor fasciae latae, one of the 10 muscles of the gluteal region, arising from the outer lip of the iliac crest, the anterior superior iliac spine, and the deep fascia lata. It lies between the two layers of fascia lata in the proximal third of the thigh and via the iliotibial band inserts onto the lateral tibial condyle (Gerty's tubercle). The tensor fasciae latae functions to flex the thigh and rotate it slightly medially. Also called *tensor fasciae femoris.*



Tensor fasciae latae *(Patton and Thibodeau, 2010)*

tensor tympani /ten′sər tim′pə·nē/, a muscle originating in the cartilaginous portion of the auditory tube and inserting in the manubrium of the malleus. It functions to tense the tympanic membrane during loud noises.

tensor veli palatine, a muscle of the soft palate that is composed of a vertical muscular part and a more horizontal fibrous part that forms the palatine aponeurosis. It tenses the soft palate so that the other muscles attached to the palate can work more effectively, and it opens the pharyngotympanic tube when the palate moves during yawning and swallowing.

tent [ME, *tente*], **1.** a transparent cover, usually of plastic, supported over the upper part of a patient by a frame. Used in the treatment of respiratory conditions, it provides a controlled environment into which steam, oxygen, vaporized medication, or droplets of cool water may be sprayed, such as an oxygen tent. **2.** a cone made of various materials inserted into a cavity or orifice of the body to dilate its opening, such as a laminaria tent. **3.** a pack placed in a wound to hold it open to ensure that healing progresses from the base of the wound upward to the skin.

tentative /ten′tətiv/ [L, *tentare,* to touch], not final or definite, such as an experimental finding that has not been validated.

tenth cranial nerve. See **vagus nerve.**

tenth-value layer (TVL) [ME, *tenpe* + L, *valere,* to be worth; AS, *lecgan,* to lie], the thickness of material required to attenuate a beam of radiation to one tenth of its original intensity. See also **half-value layer.**

tenting of skin /ten′ting/, a slow return of the skin to its normal position after being pinched, a sign of either dehydration or aging, or both. See also **skin turgor.**

-tention, suffix meaning the "condition of being held": *historetention, retention.*

-tention, -tension, suffix meaning "condition of being stretched or strained, or in which pressure is exerted": *attention, distension, intention.*

tentoria, a fold of dura mater. See **tentorium.**

tentorial herniation /tentôr′ē·əl/ [L, *tentorium,* tent, *hernia,* rupture], the protrusion of brain tissue into the tentorial notch, caused by increased intracranial pressure resulting from edema, hemorrhage, or a tumor. Characteristic signs are severe headache, fever, flushing, sweating, abnormal pupillary reflex, drowsiness, hypotension, and loss of consciousness. Also called **transtentorial herniation.**

tentorial notch [L, *tentorium,* tent; OFr, *enochier*], an area occupied by the midbrain and enclosed by the free border of the tentorium cerebelli and the sphenoid bone.

tentorium /tentôr′ē·əm/ *pl.* **tentoria** [L, tent], any part of the body that resembles a tent, such as the tentorium of the hypophysis that covers the hypophyseal fossa.

tentorium cerebelli. See **cerebellar tentorium.**

Tenuate, a trademark for an anorexiant **(diethylpropion hydrochloride).**

tenure /ten′yər/ [L, *tenere,* to hold], **1.** (in a university) a faculty appointment with few limits on the number of years it may be held. **2.** a permanent appointment usually awarded to a person who has advanced to the rank of associate professor and who demonstrates scholarship, community service, and teaching excellence in a specific field of study.

TEP, abbreviation for **tracheoesophageal puncture.**

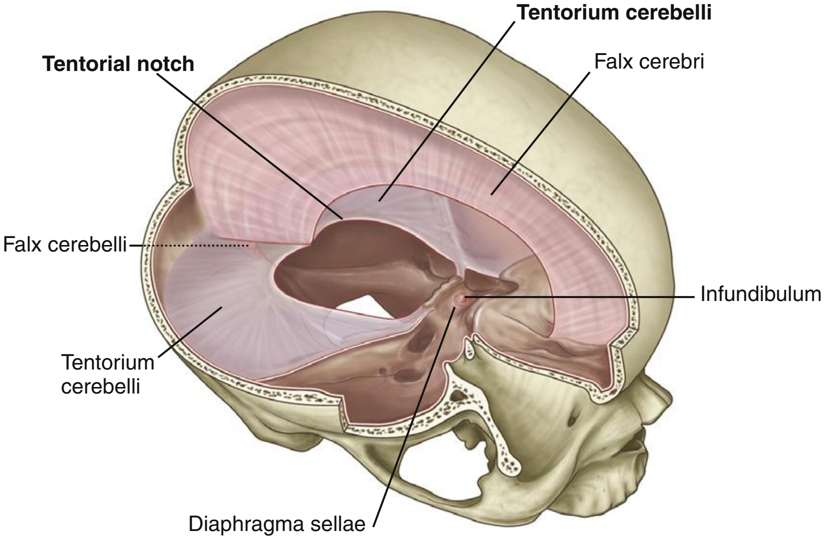
-tepa, combining form for antineoplastic thiotepa derivatives.

tephr-, prefix meaning "gray or ash-colored": *tephromalacia, tephromyelitis, tephrosis.*

tepid, moderately warm to the touch.

teprotide /tep′rōtīd/, a bradykinin-potentiating peptide.

tera-, prefix meaning "one trillion": *terabyte, terahertz.*



Tentorial notch *(Drake, Vogl, and Mitchell, 2010)*

teramorphous [Gk, *teras,* monster, *morphe,* form], of the nature of or characteristic of a teratic embryo.

teras /ter′əs/ *pl.* **terata** [Gk, monster], a severely deformed fetus. **—teratic,** *adj.*

teratic embryo, a fetus that is grossly malformed and usually nonviable. See also **teratism.**

teratism /ter′ətiz′əm/, any congenital or developmental anomaly that is produced by inherited or environmental factors or a combination of the two. Any condition in which a severely malformed fetus is produced. Kinds of teratism include **atresic teratism, ceasmic teratism, ectopic teratism, ectrogenic teratism, hypergenetic teratism,** and **symphysic teratism.** Also called **teratosis.**

terato-, prefix meaning "monster": *teratoblastoma, teratogenesis, teratoma.*

teratoblastoma /ter′ətō′blastō′mə/, a teratoma in which not all germ layers are present.

teratogen /ter′ətəjen′/ [Gk, *teras* + *genein,* to produce], any substance, agent, or process that interferes with normal prenatal development, causing the formation of one or more developmental abnormalities in the fetus. Teratogens act directly on the developing organism or indirectly, affecting such supplemental structures as the placenta or some maternal system. The type and extent of the defect are determined by the specific kind of teratogen, its mode of action, the embryonic process affected, genetic predisposition, and the stage of development at the time the exposure occurred. The period of highest vulnerability in the developing embryo is from about the third through the twelfth week of gestation, when differentiation of the major organs and systems occurs. Susceptibility to teratogenic influence decreases rapidly in the later periods of development, which are characterized by growth and elaboration. Among the known teratogens are chemical agents, including such drugs as thalidomide, alkylating agents, and alcohol; infectious agents, especially the rubella virus and cytomegalovirus; ionizing radiation, particularly x-rays; and environmental factors, such as the age and general health of the mother or any intrauterine trauma that may affect the fetus, especially during the later stages of pregnancy. Also called **teratogenic agent.** Compare **mutagen. —teratogenic,** *adj.*

teratogenesis /ter′ətōjen′əsis/, the development of physical defects in the embryo. Also called **teratogeny** /ter′ətoj′-ənē/. **—teratogenetic,** *adj.*

teratogenic agent. See **teratogen.**

teratogenous /ter′ətoj′ənəs/ [Gk, *teras,* monster, *genein,* to produce], developed from fetal membranes.

teratogeny. See **teratogenesis.**

teratoid /ter′ətoid/ [Gk, *teras* + *eidos,* form], pertaining to malformed physical development; grossly misplaced, misshapen parts.

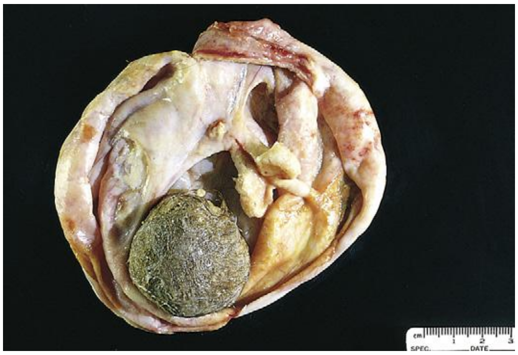
teratoid tumor. See **dermoid cyst.**

teratologic, teratological, pertaining to abnormalities of the human body. See **teratology.**

teratologist /ter′ətol′əjist/, one who specializes in the causes and effects of congenital anomalies and developmental abnormalities.

teratology /-tol′əgē/ [Gk, *teras* + *logos,* science], the study of the causes and effects of congenital malformations and developmental abnormalities. **—teratologic, teratological,** *adj.*

teratoma /ter′ətō′mə/, *pl.* **teratomas, teratomata,** a tumor composed of different kinds of tissue, none of which normally occurs together or at the site of the tumor. Teratomas are most common in the ovaries or testes.



Cystic teratoma of the ovary *(Kumar et al, 2007/Courtesy Dr. Christopher Crum, Brigham and Women's Hospital)*

teratosis. See **teratism.**

terazosin /ter′əzō′sin/, a drug approved for the treatment of benign prostatic hypertrophy. It acts by relaxing the smooth muscle fibers of the prostate through its alpha receptor blockage mechanisms. It is also used alone or in combination for the treatment of hypertension.

terbium (Tb) /tur′bē·əm/ [Yterby, Sweden], a rare earth metallic element. Its atomic number is 65; its atomic mass is 158.294.

terbutaline sulfate /terbyo͞o′təlēn/, a beta$_2$-adrenergic stimulant.

■ INDICATIONS: It is prescribed as a bronchodilator in the treatment of asthma, bronchitis, and emphysema and as a uterine relaxant to treat premature labor.

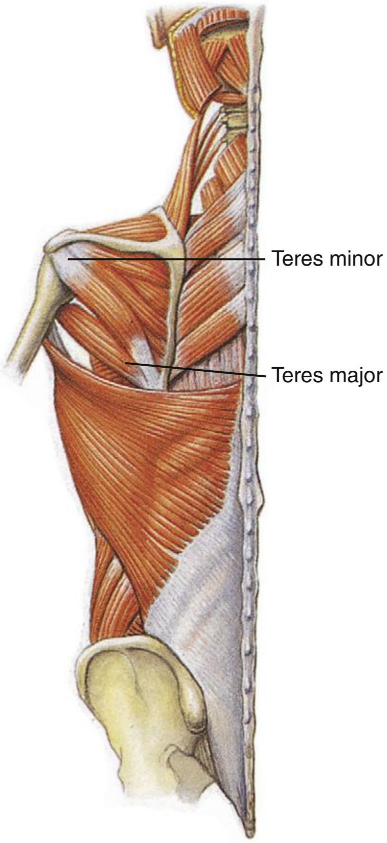
■ CONTRAINDICATIONS: Cardiac arrhythmias or known hypersensitivity to this drug prohibits its use. Toxicity is increased by monoamine oxidase inhibitors and tricyclic antidepressants, and beta-adrenergic blocker effects are decreased.

■ ADVERSE EFFECTS: Among the most serious effects are dizziness and palpitations. Nervousness and tremor are common reactions.

teres /tir′ēz, ter′ēz/ *pl.* **teretes** [L, rounded], a long cylindric muscle such as the teres minor or the teres major. **—teres,** *adj.*

teres major, a thick flat muscle of the shoulder. It functions to adduct, extend, and rotate the arm medially. Compare **teres minor.**

teres minor, a cylindric, elongated muscle of the shoulder. It functions to rotate the arm laterally, weakly adduct the arm, and draw the humerus toward the glenoid fossa of the scapula, strengthening the shoulder joint. Compare **teres major.**



Teres major and teres minor *(Patton and Thibodeau, 2010)*

teriparatide, a parathyroid hormone used to treat postmenopausal women with osteoporosis and men with primary hypogonadal osteoporosis at high risk for fracture.

term [L, *terminus,* limit], **1.** a specified period of time. **2.** the normal gestation period.

terminal /tur′minəl/ [L, *terminus,* boundary], **1.** (of a structure or process) near or approaching its end, such as a terminal bronchiole or a terminal disease. **2.** an input/output (I/O) device that has two-way communication capability with a computer. A terminal usually has a keyboard and a cathode-ray or video display screen, or a text printing facility. **—terminate,** *v.,* **terminus,** *n.*

terminal arteriole [L, *terminus,* boundary, *arteriola,* little artery], an arteriole that divides into capillaries.

terminal artery. See **end artery.**

terminal bronchiole. See **bronchiole.**

terminal cancer [L, *terminalis* + *cancer,* crab], an advanced stage of a malignant neoplastic disease with death as the inevitable prognosis.

terminal crest, a vertical crest on the interior wall of the right atrium that separates the sinus of the vena cava from the rest of the right atrium. Also called **crista terminalis, tenia terminalis.**

terminal drop, a rapid decline in cognitive function and coping ability that occurs 1 to 5 years before death.

terminal illness [L, *terminalis* + ON, *illr,* bad], an advanced stage of a disease with an unfavorable prognosis and no known cure.

terminal insomnia, a chronic sleep disturbance occurring at the end of a sleep period. It may be indicative of an underlying depressive disorder and treated with an antidepressant.

terminal nerve, a small nerve originating in the vomeronasal epithelium, projecting to the cerebral hemisphere in the region of the olfactory trigone. It is classified by most anatomists as part of the olfactory, or first cranial, nerve. It courses anteriorly along the olfactory tract and passes through the ethmoid bone. It communicates in the nasal cavity with the ophthalmic division of the trigeminal nerve.

terminal part of ileum, the part just before the ileum meets the cecum at the ileal orifice and ileal papilla. Also called *terminal ileum*.

terminal saccular period, the period or phase of prenatal lung development lasting, in different parts of the lungs, from the twenty-sixth week or later until near term and followed by the alveolar period. Walls of the air spaces become thinner and the spaces divide into alveolar saccules with adjacent capillaries; type I and type II alveolar cells begin functioning, and surfactant is secreted. Also called *terminal saccular phase*.

terminal sacs, thin-walled dilations that develop at the ends of the respiratory bronchioles during fetal development; they develop a close relationship with the capillaries, and their appearance marks the point at which limited respiration becomes possible. Also called *primitive* or *primordial alveoli* and *terminal saccules*.

terminal stance, one of the five stages in the stance phase of a walking gait, directly associated with the continuation of single limb support or the period during which the body moves forward on the supporting foot. Double limb support is initiated during the latter part of terminal stance, which is often a factor in the analysis of many abnormal orthopedic conditions and the diagnosis of weaknesses that may develop in certain muscles used in walking, such as the quadriceps femoris and the gluteus maximus. Compare **initial contact stance stage, loading response stance stage, midstance, preswing stance stage.** See also **swing phase of gait.**

terminal sulcus of the right atrium, a shallow channel on the external surface of the right atrium between the superior and inferior vena cava. Also called **sulcus terminalis cordis.**

terminal sulcus of the tongue, a V-shaped depression on the oral and pharyngeal surfaces of the tongue that forms the inferior margin of the fauces between the oral and pharyngeal cavities.

terminate. See **terminal.**

termination codon /tur′minā′shən/, a three-nucleotide sequence (UAA, UAG, or UGA) in messenger RNA that specifies the end of the sequence of amino acids in a polypeptide.

termination phase, the last stage of a therapeutic relationship when attained goals are evaluated and outcomes achieved. During this stage practitioners also may help patients establish networks of support, other than the therapist-patient relationship, that may help in coping with future problems.

termination sequence, (in molecular genetics) a deoxyribonucleic acid (DNA) segment at the end of a unit that is transcribed to messenger ribonucleic acid from the DNA template.

term infant [L, *terminus,* limit], any neonate, regardless of birth weight, born after the end of the thirty-seventh and before the beginning of the forty-third week of gestation. Infants delivered at term usually measure from 48 to 53 cm from head to heel and weigh between 2700 and 4000 g.

terminus /tur′minəs/ [L, the end], **1.** a boundary or limit. **2.** See **terminal.**

terpin /tur′pin/, **1.** a diterpene alcohol derived from turpentine oil. **2.** an expectorant ingredient produced through the action of nitric and sulfuric acids on pine oil.

terpin hydrate and codeine elixir /tur′pin/, a preparation of the expectorant terpin hydrate, with sweet orange peel tincture, benzaldehyde, glycerin, alcohol, syrup, water, and the antitussive opiate codeine. Terpin hydrate diminishes secretions and promotes healing of the mucous membrane, and codeine depresses the cough center in the medulla oblongata. Prolonged use may lead to addiction.

Terra-Cortril, a trademark for a topical fixed-combination drug containing a glucocorticoid **(hydrocortisone)** and an antibiotic **(oxytetracycline).**

Terramycin, a trademark for an antibiotic **(oxytetracycline).**

territorial /ter′ətôr′ē·əl/ [L, *territorium,* district], a type of body movement that aids in communication. A territorial will frame an interaction and define an individual's "territory." See also **territoriality.**

territoriality /ter′itôr′ē·al′itē/, an emotional attachment to and defense of certain areas related to one's existence. Humans and animals generally establish a claim to or occupy a defined or undefined area over which they can maintain some degree of control.

terti-, prefix meaning "third": *tertiary, tertigravida, tertipara.*

tertian /tur′shən/ [L, *tertius,* third], occurring every 48 hours, including the first day of occurrence, such as vivax or tertian malaria, in which fever occurs every third day. Compare **quartan.** See also **malaria.**

tertian malaria, a form of malaria caused by the protozoan *Plasmodium vivax* or *P. ovale,* characterized by febrile paroxysms that occur every 48 hours. **Vivax malaria,** caused by *P. vivax,* is the most common form of malaria. Although it is rarely fatal, it is the most difficult form to cure. Relapses are common. **Ovale malaria,** caused by *P. ovale,* is usually milder and causes only a few short attacks. Both types of tertian malaria are treated with chloroquine. Compare **falciparum malaria, quartan malaria.** See also **malaria.**

tertiary /tur′shē·er′ē, tursh′ərē/ [L, *tertius,* third], **1.** third in frequency or order of use. **2.** belonging to the third level of sophistication of development, such as a tertiary health care facility.

tertiary bronchial buds, outgrowths of the secondary bronchial buds, which become the bronchopulmonary segments of the mature lung.

tertiary bronchus. See **bronchus.**

tertiary health care, a specialized, highly technical level of health care that includes diagnosis and treatment of disease and disability. Specialized intensive care units, advanced diagnostic support services, and highly specialized personnel are usually characteristic of tertiary health care. It offers highly centralized care to the population of a large region and in some cases to the world.

tertiary intention. See **intention.**

tertiary prevention, a level of preventive medicine that deals with the rehabilitation and return of a patient to a status of maximum usefulness with a minimum risk of recurrence of a physical or mental disorder.

tertiary syphilis [L, *tertius,* third], the most advanced stage of syphilis, resulting in infections of the cardiovascular and neurological systems and marked by destructive lesions involving many tissues and organs. Late-stage syphilis is symptomatic but not contagious.

tervalent. See **trivalent.**

tesla /tes′lə/ [Nikola Tesla, American engineer, 1856–1943], a unit of magnetic flux density, defined by the International System of Units as 1 weber per square meter, the equivalent of 1 volt/second per square meter, or 10,000 gauss.

Teslac, a trademark for an antineoplastic **(testolactone).**

Tessalon, a trademark for a local anesthetic agent **(benzonatate).**

test [L, *testum,* crucible], **1.** *n,* an examination or trial intended to establish a principle or determine a value. **2.** *n,* a chemical reaction or reagent that has clinical significance. **3.** *v,* to detect, identify, or conduct a trial. See also **laboratory test.**

test-, prefix meaning "testicles": *testicond, testitoxicosis, testosterone.*

testa /tes′tə/ [L, a shell], **1.** an eggshell. **2.** powdered oyster shells used in antacids. **3.** the outer coat of a seed.

Testacealobosia /tes′təsē′lōbā′zhə/, a subclass of ameboid protozoa in which the cells are enclosed in a chitinous or membranous envelope, vest, or shell. It includes both marine and freshwater forms.

testamentary capacity /tes′təmen′tərē/, a person's competency to make a will, including awareness that a will is being made, awareness of the nature and extent of property covered by the will, and awareness of the identities of beneficiaries.

testcross [L, *testum* + *crux,* cross], **1.** a cross between a dominant and a recessive phenotype to determine either the degree of genetic linkage or whether the dominant phenotype is a result of a homozygous or a heterozygous genotype. **2.** a subject undergoing such a test. See also **backcross.**

testes, the two male gonads that produce sperm and testosterone.

testes determining factor (TDF) /tes′tēz/, a gene on the Y chromosome that is believed to determine male sexual development. Individuals with the normal female sex chromosome combination (XX) may develop as males if the TDF gene has migrated to one of the X chromosomes. Also, individuals with the normal male sex chromosome pair (XY) may develop as females if the TDF gene is missing from the Y chromosome.

test for acetone in urine, a part of routine urinalysis. Normal findings are negative, since acetone and other ketones are not normally present in urine. Exceptions include such cases as poorly controlled diabetic patients, alcoholics, and people who may be fasting or on special high-protein diets.

test for lacrimation, a test for possible dry eye and/or keratoconjunctivitis sicca conducted by placing a 35-mm long piece of filter paper in the lower fornix of the conjunctiva for 5 minutes. Failure of tears to wet as much as 10 mm of the strip indicates inadequate tear production. Also called **Schirmer's test.**

testicle. See **testis.**

testicular /testik′yələr/ [L, *testiculus,* testicle], pertaining to the testicle.

testicular artery, one of a pair of long, slender branches of the abdominal aorta, arising inferior to the renal arteries and supplying the testis.

testicular cancer, a malignant neoplastic disease of the testis occurring most frequently in men between 15 and 35 years of age. An undescended testicle is often involved. In many cases the tumor is detected after an injury, but trauma is not considered a causative factor. Patients with early testicular cancer are often asymptomatic, and metastases may be present in lymph nodes, the lungs, and the liver before the primary lesion is palpable. In the later stages there may be pulmonary symptoms, ureteral obstruction, gynecomastia, and an abdominal mass. Diagnostic measures include transillumination of the scrotum, excretory urography, lymphangiography, and a urine or serum test to evaluate circulating levels of tumor markers. Tumors develop more often in the right than in the left testis. Testis cancers are often curable. Chemotherapeutic agents, used in various combinations, are increasing the survival of patients with testicular cancer. Some of these drugs are actinomycin D, bleomycin, *cis*-platinum, cyclophosphamide, methotrexate, and vinCRIStine. Early detection by testicular self-examination enhances chances of cure.

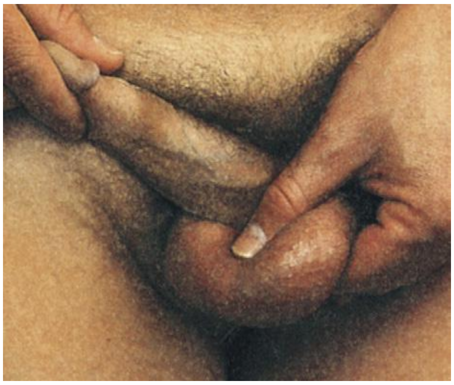
testicular duct. See **vas deferens.**

testicular feminization. See **feminization.**

testicular hormone, any androgenic steroid hormone secreted by the Leydig cells in the interstitial tissues of the male gonads. Testosterone is the principal hormone secreted by the cells, which also secrete estrogen, the female sex hormone. Testosterone may be converted into estrogen and other steroid hormones, such as dihydrotestosterone, in certain tissues. The secretion of testicular hormones is controlled by luteinizing hormone and follicle-stimulating hormone, both secreted by the anterior pituitary gland.

testicular microlithiasis, the presence of tiny calcifications in the seminiferous tubules. In some cases this precedes development of a tumor.

testicular self-examination (TSE), a procedure recommended by the National Institutes of Health for detecting tumors or other abnormalities in the male testes. The TSE is conducted in four simple steps, starting by standing in front of a mirror and looking for any swelling on the skin of the scrotum. One testicle may appear larger than the other, and one may hang lower, which is usually normal. Next, each testicle is examined with both hands, placing the fingers under the testicle while the thumbs are placed on top. The testicle is then rolled gently between the thumbs and fingers. In the next step the epididymis, a normal cordlike structure on the top and back of each testicle, should be found. A small pea-sized lump is felt for on the front or side of a testicle. The lump is usually painless. TSE should be performed once a month, usually after a warm bath or shower because the heat causes scrotal skin to relax, thereby increasing the chances of detecting any tissue abnormality. Testicular cancer almost always occurs in only one testicle. It is highly curable when detected at an early stage.



Testicular self-examination

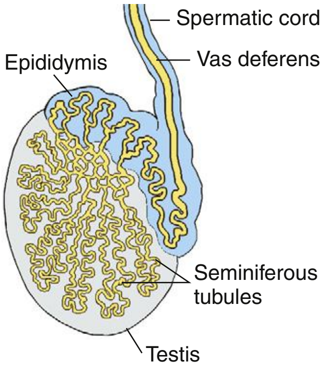
(Seidel et al, 2011)

testicular sperm extraction (TESE), for men with obstructive azoospermia, extraction of spermatozoa directly from the testis through the skin.

testicular vein, one of a pair of veins emerging from convoluted venous plexuses, forming the greater mass of the spermatic cords. The right testicular vein opens into the inferior vena cava, the left testicular vein into the left renal vein. Both testicular veins contain valves. Compare **ovarian vein.**

testimony /tes′timō′nē/ [L, *testimonium,* evidence], the statement of a witness, usually made orally and given under oath, such as at a court trial.

testis /tes′tis/, *pl.* **testes** /tes′tēz′/, one of the pair of male gonads that produces sperm and testosterone. The adult testes are suspended in the scrotum by the spermatic cords; in early fetal life they are contained in the abdominal cavity behind the peritoneum. Before birth they normally descend into the scrotum. The coverings of the testes are the skin and the dartos tunic of the scrotum, the external spermatic fascia, the cremasteric layer, the internal spermatic fascia, and the tunica vaginalis. Each testis is a laterally compressed oval body about 4 cm long and 2.5 cm wide that weighs about 12 g. It is positioned obliquely in the scrotum, with the cranial extremity directed ventrally and slightly laterally and the caudal end directed dorsally and slightly medially. The anterior border, lateral surfaces, and extremities of the organ are convex, free, smooth, and covered by the tunica vaginalis. The convoluted epididymis lying on the posterior border of the testis contains a tightly coiled tube that is about 20 feet long and connects with the vas deferens through which spermatozoa pass during ejaculation. Each testis consists of several hundred conical lobules containing the tiny coiled seminiferous tubules, each about 75 mm long, in which spermatozoa develop. In early life the tubules are pale in color, but in old age they become invested with yellow fatty matter. The tubules converge to form the rete testis, which is drained by the efferent ducts into the head of the epididymis. The testes are supplied with blood by the two internal spermatic arteries that arise from the aorta, are served by the testicular veins that form the pampiniform plexuses constituting the greater part of the spermatic cords, and are innervated by the spermatic plexuses of nerves from the celiac plexuses of the autonomic nervous system. Also called **testicle.** Compare **ovary.** See also **scrotum.** **—testicular,** *adj.*



Testis *(Shiland, 2010)*

test method, a method chosen for experimental testing or study by means of method evaluation.

test of patency of tear duct, a procedure in which drops of a weak sugar solution are placed in the eye. If the patient then detects a sweet taste, the tear duct is assumed open.

testolactone /tes′təlak′tōn/, an antineoplastic androgen analog.

■ INDICATIONS: It is prescribed as palliative treatment of advanced postmenopausal breast cancer and in premenopausal women whose ovarian function has been terminated.

■ CONTRAINDICATIONS: Pregnancy, lactation, or known hypersensitivity to this drug prohibits its use. It is not given to men.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypercalcemia and peripheral neuropathies with numbness or tingling.

testosterone /testos′tərōn/, a naturally occurring androgenic hormone.

■ INDICATIONS: It is prescribed for androgen deficiency, for female breast cancer, and for stimulation of growth, weight gain, and red blood cell production.

■ CONTRAINDICATIONS: Cancer of the male breast or prostate, liver disease, pregnancy or suspected pregnancy, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hepatic dysfunction, fluid retention, masculinization, acne, and erythrocythemia.

testosterone cypionate, a long-acting form of testosterone. Also called *testosterone cyclopentylpropionate*.

testosterone derivative. See **anabolic steroid.**

testosterone enanthate, a long-acting form of testosterone.

testosterone propionate, an androgen given intramuscularly. See also **testosterone.**

testosterone test, a blood test that detects levels of circulating testosterone in men and women. It may be used to evaluate ambiguous sex characteristics, precocious puberty, virilizing syndromes in the female, and infertility in the male. It can also be used as a tumor marker for rare tumors of the ovary and testicle.

test tube, a thin glass container with one open end and one closed end. It is used in many common laboratory procedures. Compare **Veillon tube.** See also **tube.**

test tube baby, a popular term for an infant conceived through in vitro fertilization by using an ovum removed from the mother. After fertilization the zygote is transplanted to the mother's uterus to develop normally. See also **in vitro fertilization.**

TET, **1.** abbreviation for *treadmill exercise test*. **2.** abbreviation for **tubal embryo transfer.**

-tetanic /tetan′ik/, suffix meaning "tetanus or tetany": *antitetanic, posttetanic, subtetanic*.

tetanic contraction [Gk, *tetanos*, extreme tension; L, *contractio*, drawing together], a condition of continuous contraction in a voluntary muscle caused by a steady stream of efferent nerve impulses. Also called *tetanic convulsion*. See also **physiological tetanus.**

tetanic spasm. See **physiological tetanus.**

tetano-, prefix meaning "tetanus": *tetanolysin, tetanometer, tetanophilic*.

tetanus /tet′ənəs/ [Gk, *tetanos*, extreme tension], an acute, potentially fatal infection of the central nervous system caused by the exotoxin tetanospasmin, elaborated by the anaerobic bacillus, *Clostridium tetani*. More than 50,000 people a year die of tetanus infection worldwide. The toxin is a neurotoxin and one of the most lethal poisons known. *C. tetani* infects only wounds that contain dead tissue. The bacillus is a common resident of the superficial layers of the soil and a normal inhabitant of the intestinal tracts of cows and horses; therefore barnyards and fields fertilized with manure are heavily contaminated.

■ OBSERVATIONS: The bacillus may enter the body through a puncture wound, abrasion, laceration, or burn; via the uterus into the bloodstream in septic abortion or postpartum sepsis; or through the stump of the umbilical cord of the newborn. The dead tissue of the area is low in oxygen. This is the environment essential for the replication of *C. tetani*. The infection occurs in two clinical forms: one with an abrupt onset, high mortality, and a short incubation period (3 to 21 days); the other with less severe symptoms, a lower mortality, and a longer incubation period (4 to 5 weeks). Wounds of the face, head, and neck are the ones most likely to result in fatal infection. The disease is characterized by irritability, headache, fever, and painful spasms of the muscles resulting in lockjaw, risus sardonicus, opisthotonos, and laryngeal spasm; eventually every muscle of the body is in tonic spasm. The motor nerves transmit the impulses from the infected central nervous system to the muscles. There is no lesion; even at autopsy no organic lesion is seen and the cerebrospinal fluid is clear and normal.

■ INTERVENTIONS: Prompt and thorough cleansing and debridement of the wound are essential for prophylaxis. A booster shot of tetanus toxoid is given to previously immunized people; tetanus immune globulin and a series of three injections of tetanus toxoid are given to those not immunized. People who are known to have been adequately immunized within 5 years do not usually require immunization. Treatment of people who have the infection includes maintenance of an airway, administration of an antitoxin as soon as possible, sedation, control of the muscle spasms, and assurance of a normal fluid balance. The room is kept quiet, and benzodiazepines may be given to reduce hypertonicity; penicillin G is administered for infection; and a tracheostomy is performed and oxygen given for ventilation.

■ NURSING CONSIDERATIONS: The nurse may encourage everyone to be actively immunized against the infection. The vaccine is safe and effective.

tetanus and diphtheria toxoids (Td), an active immunizing agent containing detoxified tetanus and diphtheria toxoids that slowly produce an antigenic response to the diseases.

■ INDICATIONS: This drug is used for prophylaxis when treating wounds and is the preferred method for immunization against tetanus and diphtheria in adults and children over 7 years of age. Younger children should be treated with diphtheria, pertussis, and tetanus trivalent vaccine.

■ CONTRAINDICATIONS: Immunosuppression, concomitant use of corticosteroids, or acute infection prohibits the use of this drug.

■ ADVERSE EFFECTS: Among the most serious adverse effects are allergic reactions and stinging at the site of injection.

tetanus antitoxin (TAT), a tetanus immune serum that neutralizes exotoxins in tetanus infection.

■ INDICATIONS: This drug is prescribed for short-term immunization against tetanus after possible exposure to the organism and in tetanus treatment.

■ CONTRAINDICATIONS: This drug is not given if the more effective tetanus immune globulin is available or if there is a known sensitivity to equine serum.

■ ADVERSE EFFECTS: Among the most serious adverse effects are allergic reactions and pain and inflammation at the site of injection.

tetanus immune globulin (TIG), an injectable solution prepared from the globulin of an immune human. It is effective and much safer than tetanus antitoxin.

■ INDICATIONS: This drug is prescribed for short-term immunization against tetanus after possible exposure to the organism and for tetanus treatment.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It should not be substituted for tetanus toxoid.

■ ADVERSE EFFECTS: The most serious adverse effect is anaphylaxis. Fever, pain, and inflammation at the site of injection may occur.

tetanus toxin, the potent exotoxin produced by *Clostridium tetani,* consisting of two components, one a neurotoxin *(tetanospasmin)* and the other a hemolysin *(tetanolysin)*.

tetanus toxoid, an active immunizing agent prepared from detoxified tetanus toxin that produces an antigenic response in the body, conferring permanent immunity to tetanus infection.

■ INDICATIONS: It is prescribed for primary active immunization against tetanus, generally in combination with diphtheria and pertussis vaccines.

■ CONTRAINDICATIONS: Immunosuppression or immunoglobulin abnormalities, acute infection, or illness prohibits its use.

■ ADVERSE EFFECTS: The most serious adverse effect is hypersensitivity. Pain and inflammation at the site of injection may occur.

tetany /tet′ənē/ [Gk, *tetanos,* extreme tension], a condition characterized by cramps, convulsions, twitching of the muscles, and sharp flexion of the wrist and ankle joints. These symptoms are sometimes accompanied by attacks of stridor. Tetany is a manifestation of an abnormality in calcium metabolism, which can occur in association with vitamin D deficiency, hypoparathyroidism, alkalosis, or the ingestion of alkaline salts. Kinds of tetany are **duration tetany, gastric tetany, hyperventilation tetany,** and **hypocalcemic tetany.**

tetart-, prefix meaning "fourth": *tetartanopia, tetartocone, tetartoconoid*.

tetra- /tet′rə/, **tetro-,** combining form meaning "four": *tetracycline, tetrahydric, tetranopsia*.

tetrabasic /tet′rəbā′sik/, **1.** *adj,* describing a compound that has four acidic hydrogen atoms replaced by metal ions. **2.** *n,* an alcohol containing four hydroxyl groups.

tetracaine hydrochloride, a local anesthetic used for long-term spinal block and topical anesthesia.

2,3,7,8-tetrachlorodibenzo-*para*-dioxin. See **dioxin.**

tetrachloroethane /-klôr′ō·eth′ān/, a potentially toxic solvent with a sweet, chloroform-like odor. It is used to dissolve fats, waxes, oils, and resins and in the manufacture of paints, varnishes, and rust removers. Symptoms of overexposure include nausea, vomiting, abdominal pain, finger tremors, skin disorders, and liver damage.

tetrachloromethane. See **carbon tetrachloride.**

tetracycline hydrochloride, an antibiotic.

■ INDICATIONS: It is prescribed in the treatment of bacterial infections.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or to other tetracyclines prohibits its use. Use during pregnancy or in children under 8 years of age may result in discoloration of the child's teeth. It is to be administered with caution with renal or liver impairment.

■ ADVERSE EFFECTS: Among the most serious effects are potentially serious superinfections, allergic reactions, phototoxicity, and GI disturbances.

tetrad /tet′rad/ [Gk, *tetra,* four], a group of four chromatids of a synapsed pair of homologous chromosomes during the first meiotic prophase of gametogenesis. The group is formed in preparation for the two meiotic divisions in the maturation of gametes. **—tetradic,** *adj*.

tetradactyly /-dak′tilē/ [Gk, *tetra* + *dactylos*], the presence of only four fingers on each hand or four toes on each foot (quadridigitate).

tetradic, having four parts. See **tetrad.**

tetraethyl lead /tet′rə·eth′il led/, a potentially toxic, antiknock gasoline additive. Effects of overexposure include insomnia, lassitude, anxiety, nausea, tremor, pallor, hypothermia, anorexia, and psychosis.

tetrahydrobiopterin /tet′rə·hī′drō·bī·op′tər·in/, a compound related to folic acid that functions as a coenzyme in the reactions hydroxylating phenylalanine, tryptophan, and tyrosine by carrying electrons to oxygen. Defects in its biosynthesis or regeneration affect all three hydroxylation reactions, interfere with production of the corresponding neurotransmitter precursors, and result in malignant hyperphenylalaninemia.

tetrahydrocannabinol (THC) /-hi′drōkənab′inol/, the active principle, occurring as two psychotomimetic isomers, in the hemp plant *Cannabis sativa,* used in the preparation of marijuana, hashish, bhang, and ganja. THC increases pulse rate and has variable effects on blood pressure. It causes conjunctival reddening and a feeling of euphoria. The drug affects memory, cognition, and the sensorium; decreases motor coordination; and increases appetite. Nonintoxicating doses of THC are used experimentally in the treatment of glaucoma and to relieve nausea and increase the appetite in patients receiving cancer chemotherapy. See also **cannabis.**

tetrahydrozoline hydrochloride /-hīdroz′əlēn/, an adrenergic vasoconstrictor.

■ INDICATIONS: It is prescribed for the treatment of nasal and nasopharyngeal congestion and as an ophthalmic vasoconstrictor.

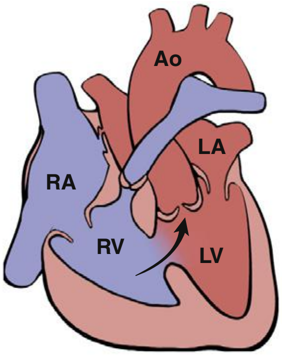
■ CONTRAINDICATIONS: Glaucoma or known hypersensitivity to this drug or to other vasoconstrictors prohibits its use. It is used with caution in patients who have cardiovascular disease.

■ ADVERSE EFFECTS: Among the more serious adverse effects are irritation to mucosa, rebound nasal congestion, and effects associated with systemic absorption, including sedation, alterations in cardiovascular function, and hypertension.

tetraiodothyronine. See **thyroxine.**

tetralogy /tetrol′əjē/ [Gk, *tetra,* four, *logos,* word], any group of four writings, symptoms, or other related factors. See also **tetralogy of Fallot.**

tetralogy of Fallot /falō′/ [Gk, *tetra,* four, *logos,* word; Etienne-Louis A. Fallot, French physician, 1850–1911], a congenital cardiac anomaly that consists of four defects: pulmonary stenosis, ventricular septal defect, malposition of the aorta so that it arises from the septal defect or the right ventricle, and right ventricular hypertrophy. The primary symptoms in the infant are cyanosis, hypoxia, difficulty in feeding, failure to gain weight, and poor development. In older children a squatting position and clubbing of the fingers and toes are evident. A pansystolic murmur is usually heard, and the second heart sound is faint or absent. Diagnosis of the condition is primarily based on the patient's history and physical symptoms, although cardiac catheterization is performed to evaluate the severity of the defects. Initial treatment consists mainly of supportive measures and palliative surgical procedures, primarily systemic to pulmonary anastomoses to decrease tissue hypoxia and prevent complications until the child is old enough to tolerate total corrective surgery. The optimal age for surgical repair is approximately 1 year. Also called **Fallot's syndrome.** See also **blue baby, trilogy of Fallot.**



Tetralogy of Fallot
(Kumar et al, 2007/Courtesy Dr. William D. Edwards, Mayo Clinic)

tetramer /tet′rəmer/ [Gk, *tetra* + *meros,* part], something that is composed of four parts, such as a protein composed of four polypeptide subunits.

tetraodon poisoning, a reaction caused by a toxin in puffer fish and marine sunfish. It may result in myalgia, paresthesia, and other neuromuscular disorders. Death may result from respiratory paralysis. See also **ciguatera poisoning, fish poisoning, scombroid poisoning.**

tetraparesis /tet′rə·pərē′sis/ [Gk, *tetra,* four + *paresis,* relaxation], muscular weakness affecting all four extremities.

tetrapeptide /-pep′tīd/, a compound formed by four amino acids united by peptide links.

tetraplegia, paralysis of the arms, legs, and trunk of the body below the level of an associated injury to the spinal cord. This disorder is usually caused by spinal cord injury, especially in the area of the fifth to the seventh vertebrae. Automobile accidents and sporting mishaps are common causes. This condition affects about 150,000 Americans, the majority of whom are men between 20 and 40 years of age. Signs and symptoms commonly include flaccidity of the arms and the legs and the loss of power and sensation below the level of the injury. Cardiovascular complications also may develop from any injury that damages the spinal cord above the fifth cervical vertebra because of an associated block of the sympathetic nervous system. A major cause of death from such injury is respiratory failure. Other symptoms may include low body temperature, bradycardia, impaired peristalsis, and autonomic dysreflexia. Diagnosis is based on a complete physical and neurological examination with radiographic pictures of the head, chest, and abdomen to rule out underlying injuries. Spinal x-ray examinations and CT scores and MRI are usually done to evaluate the extent of the injury. Also called **quadriplegia.** Compare **hemiplegia, paraplegia.**

■ INTERVENTIONS: Treatment starts at the accident scene, where the patient's neck and spine are immobilized. Additional immobilization at the hospital commonly includes the use of halo traction. Steroids may be administered to decrease spinal cord edema. Surgery is commonly performed to fuse unstable spinal sections and remove bone fragments.

■ NURSING CONSIDERATIONS: Nursing care includes maintaining adequate respiration and blood pressure according to the Guidelines for Management of Spinal Cord Injury, maintaining the integrity of the GI system, preventing complications such as hypothermia, bradycardia, catheter obstruction, and fecal impaction. A quadriplegic patient who suffers hypothermia is wrapped in blankets instead of being warmed with hot water bottles or electromechanic devices because such devices can burn the skin of the patient experiencing severe sensory loss. Abdominal binders and antiembolism hose are used when the patient is placed in an upright position. Patients who develop bradycardia are commonly connected to a cardiac monitor and intravenously administered an antimuscarinic drug, such as atropine. Fecal impaction may cause hypertension and is always a possible complication.

tetraploid (4n) /tet′rəploid/ [Gk, *tetraploos,* fourfold, *eidos,* form], **1.** an individual, organism, strain, or cell that has four complete sets of chromosomes, quadruple the haploid number characteristic of the species. In humans the tetraploid number is 92; it occurs extremely rarely, in aborted or stillborn fetuses. **2.** also *tetraploidic.* Pertaining to such an individual, organism, strain, or cell. Compare **diploid, haploid, triploid.** See also **polyploid. —tetraploidy,** *n.*

tetraploidy /tet′rəploi′dē/, the state or condition of having four complete sets of chromosomes.

tetrasaccharide /-sak′ərīd/, a sugar containing four molecules of monosaccharide.

tetrascelus /tetras′ēləs/, a fetal anomaly with four legs.

tetravalent /-vā′lənt/, pertaining to a chemical with a valency of four.

tetro-. See **tetra-.**

tetrodotoxism /tet′ro-do-tok′sizm/, the most severe form of fish poisoning, caused by ingestion of inadequately prepared fish that contain tetrodotoxin. After eating such fish, within minutes there are symptoms of malaise, dizziness, and tingling about the mouth, which may be followed by ataxia, convulsions, respiratory paralysis, and death.

Texas catheter. See **condom catheter.**

TF, abbreviation for **transfer factor.**

TFIIE, a general transcription factor involved in complementary DNA encoding. TFIIE consists of two subunits, TFIIE-alpha and TFIIE-beta.

T fracture /tē′frakchər/, an intercondylar fracture in which the fracture lines are T-shaped.

TGC, abbreviation for **time gain compensation.**

TGF, abbreviation for **transforming growth factor.**

T group. See **sensitivity training group.**

TGs, abbreviation for **triglycerides test.**

Th, symbol for the element **thorium.**

THA, abbreviation for **total hip arthroplasty.**

thalame. See **thalamus.**

thalamic /thalam′ik/ [Gk, *thalamos,* chamber], pertaining to the thalamus.

thalamic peduncle [Gk, *thalamos,* chamber; L, *pes,* foot], a group of fibers linking the thalamus with the hypothalamus.

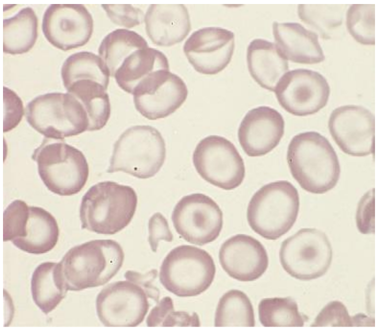
thalamic syndrome [Gk, *thalamos* + *syn,* together, *dromos,* course], a vascular disorder involving the ventral and posterolateral nuclei of the thalamus and related nerve fibers. It causes disturbances of sensation and partial or complete paralysis of one side of the body. A major effect is an increased threshold to all stimuli on the opposite side of the body so that any stimuli may cause an exaggerated response. Also called *Dejerine-Roussy syndrome*.

thalamo-, prefix meaning "relating to the thalamus": *thalamocortical, thalamotomy*.

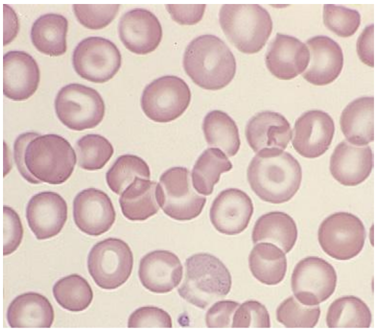
thalamotomy /thal′əmot′əmē/, the surgical production of lesions within the nuclei of the thalamus, generally performed to treat diseases of the basal ganglia.

thalamus /thal′əməs/ *pl*. **thalami** [Gk, *thalamos,* chamber], one of a pair of large oval nervous structures made of gray matter and forming most of the lateral walls of the third ventricle of the brain and part of the diencephalon. It relays sensory information, excluding smell, to the cerebral cortex. It is composed mainly of gray substance and translates impulses from appropriate receptors into crude sensations of pain, temperature, and touch. It also participates in associating sensory impulses with pleasant and unpleasant feelings, in the arousal mechanisms of the body, and in the mechanisms that produce complex reflex movements. Compare **epithalamus, hypothalamus, subthalamus. —thalamic,** *adj*.

thalassemia /thal′əsē′mē·ə/ [Gk, *thalassa,* sea, *a* + *haima,* without blood], production and hemolytic anemia characterized by microcytic, hypochromic red blood cells. Thalassemia is caused by inherited deficiency of alpha- or beta-globin synthesis. See also **hemochromatosis, hemosiderosis.**



Thalassemia major



Thalassemia minor

Thalassemia *(Damjanov and Linder, 2000)*

thalasso-, combining form meaning "the sea": *thalassophobia, thalassotherapy*.

thalassotherapy /thalas′ōther′əpē/ [Gk, *tahassa,* seal], a treatment system based on sea bathing and exposure to sea air.

thalidomide /thalid′əmīd/, a sedative-hypnotic sometimes prescribed for the treatment of leprosy. It is never given to women who are or who might become pregnant.

thallium (Tl) /thal′ē·əm/ [Gk, *thallos,* green line], a soft, bluish-white metallic element that exhibits some nonmetallic chemical properties. Its atomic number is 81; its atomic mass (weight) is 204.38. Many of its compounds are highly toxic. Thallium sulfate is widely used as a rat poison.

thallium poisoning, a toxic condition caused by the ingestion or absorption through the skin of thallium salts, especially thallium sulfate. Characteristic of the condition are abdominal pain, vomiting, bloody diarrhea, tremor, delirium, and alopecia. Thallium has been used in insect and rodent poisons, fireworks, and some cosmetic hair removers, but this extremely toxic and cumulative poison was banned for use in household products in 1965.

thallium stress test. See **stress test.**

thanato-, combining form meaning "death": *thanatobiologic, thanatognomonic, thanatology*.

thanatology /than′ətol′əjē/ [Gk, *thanatos,* death, *logos,* science], the study of death and dying. **—thanatologist,** *n*.

thanatomania /than′ətōmā′nē·ə/ [Gk, *thanatos,* death, *mania,* frenzy], an obsession with death, dying, or suicide.

thanatophoric dwarf /than′ətōfôr′ik/ [Gk, *thanatos* + *phoros,* bearer; AS, *dweorge*], an infant with severe micromelia, the limbs usually extending straight out from the trunk; an extremely narrow chest; and flattened vertebral bodies with wide intervertebral spaces. Death usually occurs from respiratory complications shortly after birth.

Thanatos /than′ətəs/ [Gk, death], a freudian term for the death instinct.

thanotopsy. See **autopsy.**

thaumato-, combining form meaning "marvel or miracles": *thaumatology, thaumaturgic, thaumaturgy*.

THC, abbreviation for **tetrahydrocannabinol.**

The Joint Commission (TJC), a private nongovernmental agency that establishes guidelines for the operation of hospitals and other health care facilities, conducts accreditation programs and surveys, and encourages the attainment of high standards of institutional medical care in the United States. Members of TJC include representatives from the American Medical Association, American College of Physicians, American College of Surgeons, American Dental Association, and American Hospital Association.

theater /thē′ətər/, **1.** an operating room or suite of rooms. **2.** a large room used for lectures and demonstrations.

thebesian foramen /thəbē′zē·ən, tābā′zē·ən/ [Adam C. Thebesius, German physician, 1686–1732], any of the openings of the vena cordis minima into the right atrium and ventricles.

thebesian vein [Adam C. Thebesius], any of the smallest cardiac veins.

thec-, prefix meaning "sheath, such as of a tendon": *thecal, thecitis, thecodont*.

theca /thē′kə/, *pl*. **thecae,** a sheath or capsule, such as the theca cordis or pericardium.

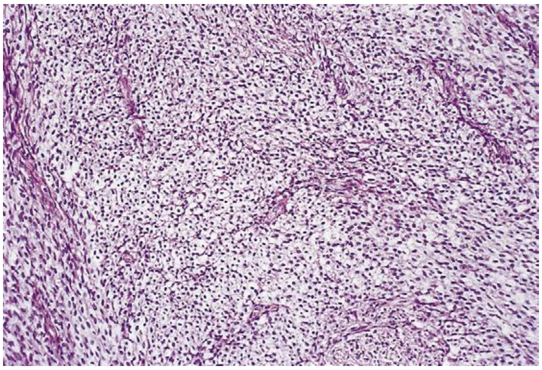
theca cells, theca-lutein cells, lutein cells derived from the theca interna.

theca cell tumor [Gk, *theke,* sheath; L, *cella,* storeroom; *tumor,* swelling], an uncommon benign fibroid tumor of the ovary, composed of theca cells and usually containing granulosa (follicular) cells. Characteristically solid masses with yellow fatty streaks, these tumors are frequently associated with excessive estrogen production and tend to develop cystic degeneration. Also called **fibroma thecocellulare xanthomatodes, thecoma** /thēkō′mə/.

thecal /thē′kəl/ [Gk, *theke,* sheath], pertaining to a theca or sheath.

-thecium, suffix meaning a "sack or container": *bdellepithecium, epithecium, perithecium*.

thecoma, a tumor derived from ovarian mesenchyme, consisting of spindle-shaped cells that may contain fat droplets. It is sometimes associated with excessive estrogen production and precocious sexual development in prepubertal girls.



Thecoma *(Fletcher, 2007)*

Theden's bandage /tā′dənz/ [Johann C.A. Theden, German surgeon, 1714–1797], a roller bandage applied below the injury and continued upward over a compress, used to stop bleeding. Also called **Genga's bandage.**

thel-, prefix meaning "nipple": *thelalgia, theleplasty, thelitis*.

thelarche /thilär′kē/ [Gk, *thele*, nipple, *archaios*, beginning], the beginning of female pubertal breast development, normally occurring between 9 and 13 years of age. Thelarche occurs before puberty at the beginning of the phase of rapid growth. **Premature thelarche** is precocious breast development in a female without other evidence of sexual maturation. Compare **menarche.**

-thelia, suffix meaning "(condition of the) nipples": *epithelia, hyperthelia, microthelia*.

-thelioma, suffix meaning a "tumor in a cellular tissue": *celiothelioma, hemendothelioma, perithelioma*.

-thelium, suffix meaning a "layer of (specified kind of) cellular tissue": *desmepithelium, mesothelium*.

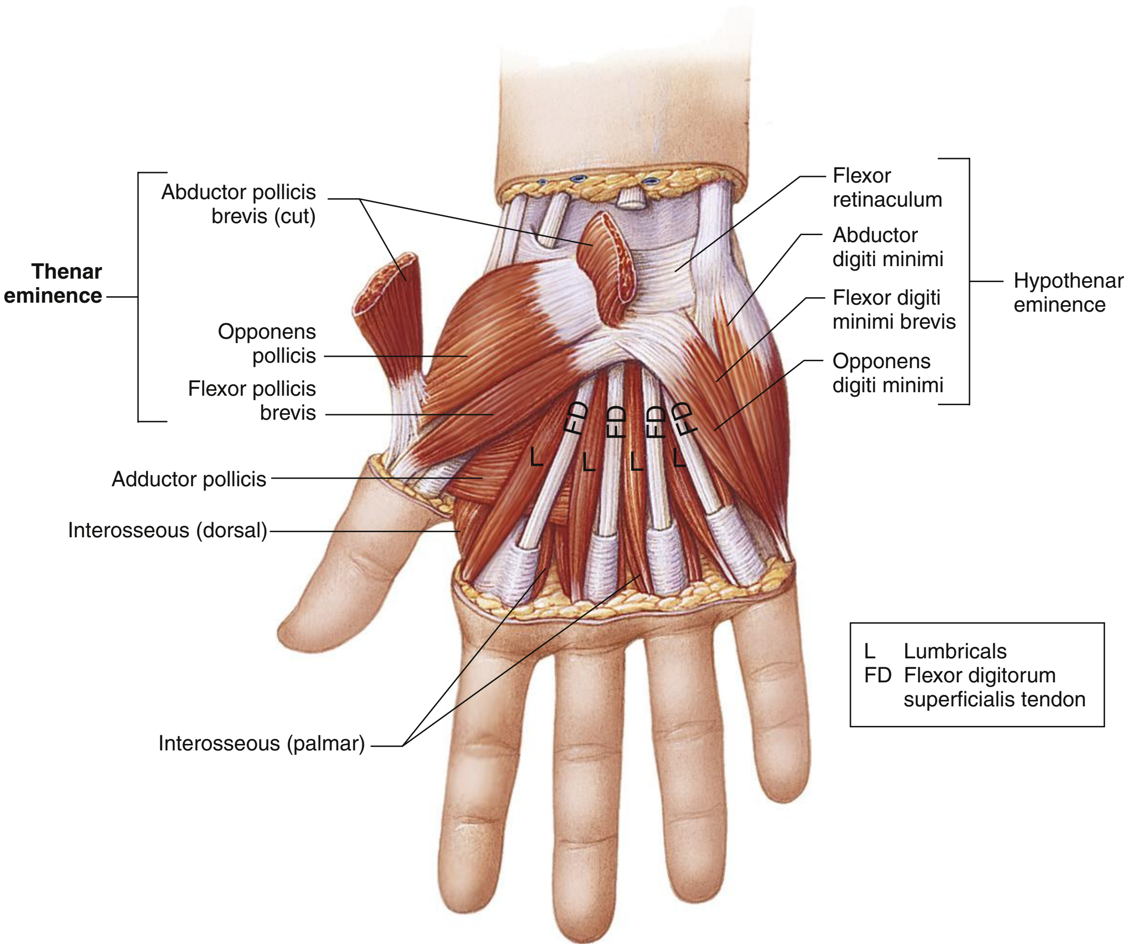
thely-, prefix meaning "female": *thelyblast, thelygenic, thelyplasty*.

thenar /thē′när/ [Gk, palm of the hand], pertaining to any structure in relation to the ball of the thumb, such as the three thenar muscles.

thenar eminence [Gk, *thenar,* palm of the hand; L, *eminentia,* projection], a raised fleshy area on the palm of the hand near the base of the thumb.

theo-, prefix meaning "a god": *theomania, theophobia, theotherapy*.

theobroma oil /thē′ōbrō′mə/, a liquid fat derived from seeds of *Theobroma cacao,* the cocoa plant. It contains a number of fatty acids used in suppositories, ointments, and lubricants.



Thenar eminence
Abductor pollicis brevis (cut)

Thenar eminence *(Patton and Thibodeau, 2010)*

theobromine /thē′əbrō′min/, a substance (methylxanthine) that is related chemically to caffeine and theophylline but differs from them by the number and distribution of methyl groups. Theobromine occurs naturally in cocoa, cola nuts, and tea. It acts as a diuretic, vasodilator, cardiac stimulant, and smooth muscle relaxant.

Theolair, a trademark for a bronchodilator **(theophylline).**

theophylline /thē·əfil′ēn/ [L, *thea*, tea; Gk, *phyllon*, leaf], a bronchodilator.

■ INDICATIONS: It can be prescribed for oral administration to relax the smooth muscle of the bronchial passages in the treatment of bronchospasm in bronchial asthma, bronchitis, and emphysema. Its use has tapered sharply because of the availability of safer and more effective asthma medications that can be administered by inhalation.

■ CONTRAINDICATIONS: Hypertension, cardiac disease, liver disease, renal disease, or concurrent treatment with other xanthines may prohibit its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are hypersensitivity, GI bleeding, palpitations, and seizures.

theorem /thē′ərəm/ [Gk, *theorein*, to look at], **1.** a proposition to be proved by a chain of reasoning and analysis. **2.** a rule expressed by symbols or formulae.

theoretic effectiveness /thē·əret′ik/ [Gk, *theorein* + L, *efficere*, to do], (of a contraceptive method) the effectiveness of a medication, device, or method in preventing pregnancy if used consistently and exactly as intended without error. Compare **use effectiveness.**

theoretic plate number (N), a number defining the efficiency of a chromatographic column.

theories of aging, theories proposed to explain aging and death of cells and organisms. They are generally divided into two major groupings. The first group consists of programmed causes, with timed functional changes, and is generally based on genetic theories; this group includes programmed senescence of cells, shortening of telomeres, and declines in hormonal or in immunological function. The second group, called stochastic theories, consists of theories based on random events occurring over time and includes free radical generation, gradual wear and tear, mutation over time, and differences in metabolic rate.

theory /thē′ərē/ [Gk, *theorein*, to look at], an abstract statement formulated to predict, explain, or describe the relationships among concepts, constructs, or events. Theory is developed and tested by observation and research supplying factual data.

Theory of Caring. See **Swanson, Kristen M.**

Theory of Caritative Care. See **Eriksson, Katie.**

Theory of Chronic Sorrow. See **Eakes, Georgene Gaskill; Burke, Mary Lermann; Hainsworth, Margaret A.**

Theory of Comfort. See Kolcaba, Katharine.

Theory of Illness Trajectory. See **Wiener, Carolyn L.: Dodd, Marylin J.**

theotherapy /thē′ōther′əpē/ [Gk, *theos*, god, *therapeia*, treatment], a therapeutic approach to the prevention, diagnosis, and treatment of disease and dysfunction based on religious or spiritual beliefs.

therapeutic /ther′əpyo͞o′tik/ [Gk, *therapeuein*, to treat], **1.** beneficial. **2.** pertaining to a treatment.

-therapeutic, -therapeutics, suffix meaning “medical treatment by (specified) techniques”: *kinetotherapeutic*, *orthotherapeutic*, *radiotherapeutics*.

therapeutic abortion, **1.** a termination of early pregnancy deemed necessary by a physician. **2.** *(informal)* any legal induced abortion. Compare **elective abortion.** See also **induced abortion.**

therapeutic communication, a process in which the nurse consciously influences a client or helps the client to a better understanding through verbal or nonverbal communication. Therapeutic communication involves the use of specific strategies that encourage the patient to express feelings and ideas and that convey acceptance and respect.

therapeutic community (TC), (in mental health) a treatment facility in which the entire milieu is part of the treatment. The physical environment, the other clients, the staff, and the policies of the facility influence the function of the individual in the activities of daily living in the community. The concept of a therapeutic community is integral to milieu therapy.

therapeutic dose [Gk, *therapeia*, treatment, *dosis*, giving], the dose that may be required to produce a desired effect.

therapeutic drug monitoring test (TDM), a blood test that entails taking measurements of blood drug levels to determine effective drug dosages and to prevent toxicity. It is also used to identify noncompliant patients.

therapeutic equivalent, a drug that has essentially the same effect in the treatment of a disease or condition as one or more other drugs. A drug that is a therapeutic equivalent may or may not be chemically equivalent, bioequivalent, or generically equivalent. See also **bioequivalent, chemical equivalent, generic equivalent.**

therapeutic exercise, any exercise planned and performed to attain a specific physical benefit, such as maintenance of the range of motion, strengthening of weakened muscles, increased joint flexibility, or improved cardiovascular and respiratory function.

therapeutic fever. See **pyrotherapy.**

therapeutic gain, the ratio of the biological effect of a therapy on a tumor compared with the effect on surrounding normal tissue. Higher therapeutic gains mean lower complications of therapy.

therapeutic horseback riding, an equestrian experience for those with special needs, promoting the ability to build independence and self-confidence and to help the person reach individualized goals.

therapeutic index (TI), the difference between the minimum therapeutic and minimum toxic concentrations of a drug.

therapeutic media, activities that are meaningful and motivating to clients in relation to individual goals.

therapeutic plasmapheresis. See **plasma exchange.**

therapeutic play, **1.** a nursing intervention from the Nursing Interventions Classification (NIC) defined as purposeful and directive use of toys or other materials to assist children in communicating their perception and knowledge of their world and to help in gaining mastery of their environment. See also **Nursing Interventions Classification.** **2.** a well established therapeutic modality used by psychotherapists, occupational therapists, and other health care providers. Research, both qualitative and quantitative, supports its effectiveness. Sessions may occur with individual children or with groups of children.

therapeutic pneumothorax [Gk, *therapeia*, treatment, *pneuma*, air, *thorax*], the intentional introduction of air into the pleural space, causing partial collapse of a lung. It was used in the 1940s for treatment of certain cases of tuberculosis. Also called **artificial pneumothorax.**

therapeutic radiology. See **radiology.**

therapeutic radiopharmaceutical, a radioactive drug administered to a patient to deliver radiation to body tissues internally. Examples are iodine-131, which is used to ablate thyroid tissue in hyperthyroid patients; cesium-137; iridium-192; radium-226; and strontium-90, which is implanted in a sealed source for the treatment of malignancies.

therapeutic recreation, an allied health group staffed by people with expertise in organizing and supervising recreational activities designed to accelerate recovery from mental or physical disorders.

therapeutic recreation specialist, a person who assists patients in their recovery or rehabilitation after physical or emotional illness or disability by planning and supervising recreation programs.

therapeutics /ther′əpyo͞o′tiks/ [Gk, *therapeia,* treatment], a branch of health care that is concerned with the treatment of disease, seeking to relieve symptoms or produce a cure. See also **therapeutic.**

therapeutic temperature, (in hyperthermia treatment) temperatures between 107° F and 113° F (42° C and 45° C).

therapeutic touch (TT)[1]**,** a healing method based on the premise that the body possesses an energy field that can be affected by the focused intention of the healer, using a consciously directed exchange of energy between practitioner and patient. The practitioner uses the hands as a focus to assess the patient's energy field, to release areas where the free flow of energy is blocked, and to balance the patient's energy by transferring energy from a universal life energy force to the patient.

therapeutic touch[2]**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as attuning to the universal healing field, seeking to act as an instrument for healing influence, and using the natural sensitivity of the hands to gently focus and direct the intervention process. See also **Nursing Interventions Classification.**

therapeutic use of self, thoughtful and deliberate use of one's personality, opinions, and judgments as a component of the therapeutic process.

-therapia, -therapy, suffix meaning "a specific type of medical care": *balneotherapia, hypnotherapy, odontotherapia.*

therapist /ther′əpist/, a person with special skills, obtained through education and experience, in one or more areas of health care.

therapy /ther′əpē/ [Gk, *therapeia,* treatment], the treatment of any disease or a pathological condition, such as inhalation therapy, which administers various medicines for patients suffering from diseases of the respiratory tract.

-therapy. See **-therapia.**

therapy group, a nursing intervention from the Nursing Interventions Classification (NIC) defined as application of psychotherapeutic techniques to a group, including the utilization of interactions between members of the group. See also **Nursing Interventions Classification.**

therio-, prefix meaning "beasts": *theriomimicry, theriotherapy, theriotomy.*

therm-. See **thermo-.**

-therm, -thermia, -thermy, suffix meaning "a state of heat": *allotherm, azothermia, hypothermia, poikilotherm.*

thermal /thur′məl/ [Gk, *thermē,* heat], pertaining to the production, application, or maintenance of heat. Also **thermic.**

thermal biofeedback, the monitoring of skin temperature as an index of blood flow changes because of the dilation and constriction of blood vessels, the feedback being displayed to the patient on a video monitor, accompanied by an audible signal. It is used for stress management and in the treatment of Raynaud disease, hypertension, and migraine.

thermal burn, tissue injury, usually of the skin, caused by exposure to extreme heat. See also **burn.**

thermal dilution. See **thermodilution.**

thermal field size, the area over which therapeutic heating is likely to be produced.

thermalgesia /thur′məljē′zhə/ [Gk, *thermē,* heat, *algos,* pain], pain caused by exposure to high temperatures.

thermalgia /thurmal′jə/, a sensation of intense burning pain sometimes experienced following nerve injuries.

thermal radiation [Gk, *thermē,* heat; L, *radiare,* to shine], the emission of energy in the form of heat.

-thermia. See **-therm.**

thermic, pertaining to heat. See **thermal.**

thermic fever. See **heat hyperpyrexia.**

thermic sense /thur′mik/ [Gk, *thermē,* heat; L, *sentire,* to feel], the network of sense organs and connecting pathways that allow an appreciation of temperature changes. Also called **temperature sense.**

thermionic emission /ther′mī·on′ik/, the emission of electrons and ions by incandescent bodies.

thermistor /thərmis′tər/ [Gk, *thermē* + L, *resistere,* to withstand], a kind of thermometer for measuring minute changes in temperature. The resistance of a thermistor varies with the ambient temperature, thereby enabling accurate measurements of small temperature changes. See also **temperature, thermometer.**

thermo-, therm-, prefix meaning "heat": *thermochemistry, thermogenesis, thermopalpation.*

thermocautery /thur′mōkô′tərē/ [Gk, *thermē* + *kauterion,* branding iron], the use of a needle or snare heated by direct flame, a heated hydrocarbon vapor, or an electric current in the destruction of tissue. See also **Paquelin's cautery.**

thermochemistry /-kem′istrē/ [Gk, *thermē,* heat, *chemia,* alchemy], a branch of chemistry that is concerned with the heat changes involved in chemical reactions.

thermocoagulation /-kō·ag′yəlā′shən/ [Gk, *thermē,* heat; L, *coagulare*], the use of high-frequency electric currents to destroy tissue through heat coagulation.

thermocouple /thur′məkup′əl/ [Gk, *thermē* + Fr, *couple,* pair], a temperature-measuring device that relies on the production of a temperature-dependent voltage at the junction of two dissimilar metals.

thermodilution /-dilyo͞o′zhən/, a method of cardiac output determination. A bolus of solution of known volume and temperature is injected into the right atrium, and the resultant change in blood temperature is detected by a thermistor previously placed in the pulmonary artery with a catheter. Also called **thermal dilution.**

thermodynamics /-dīnam′iks/ [Gk, *thermē,* heat, *dynamis,* power], the science of the interconversion of heat and work.

thermogenesis /thur′mōjen′əsis/ [Gk, *thermē* + *genesis,* origin], production of heat, especially by the cells of the body. **—thermogenetic,** *adj.*

thermogenic center. See **thermoregulatory center.**

thermograph /thur′məgraf′/ [Gk, *thermē* + *graphein,* to record], **1.** a photographic record of the amount of heat radiated from the surface of the body, revealing "hot spots" of potential tumors or other disorders. **2.** a device consisting of a thermometer, inked stylus, and chart for continuous recording of the ambient temperature.

thermography /thərmog′rəfē/, a technique for sensing and recording on film hot and cold areas of the body by means of an infrared detector that reacts to blood flow. Disease states that manifest increased or decreased blood flow present thermographic patterns that can be distinguished from those of normal areas. **—thermographic,** *adj.*

thermoinhibitory center. See **thermoregulatory center.**

thermointegrator /thur′mō·in′təgrā′tər/, an instrument used to create a thermal model of an environment, measuring the warmth and coldness as it might be experienced by a living organism in that environment.

thermokeratoplasty /-ker′ətōplas′tē/, a procedure to correct myopia by applying heat to flatten the cornea. The heat shrinks the collagen in the substantia propria layer of the cornea.

thermolabile /thur′məlā′bəl/ [Gk, *thermē* + L, *labilis,* slipping], easily destroyed or altered by heat. Also called **heat labile.** Compare **thermostable.**

thermoluminescent dosimetry /-lo͞o′mines′ənt/ [Gk, *thermē* + L, *lumen,* light; Gk, *dosis,* something given, *metron,* measure], a method of measuring the ionizing radiation to which a person is exposed by means of a device that contains a radiation-sensitive crystalline material. The material stores the radiation's energy by changing structure. When the material is heated at some later time, it releases the energy as ultraviolet or visible light. The light emitted is detected by a photomultiplier tube that generates an electric signal whose magnitude reflects the amount of ionizing radiation originally received.

thermomassage /-məsäzh′/, a physical therapy technique that combines heat and massage.

thermometer /thermom′ətər/ [Gk, *thermē* + *metron,* measure], an instrument for measuring temperature. Originally, it consisted of a sealed glass tube marked in degrees Celsius or Fahrenheit and contained liquid such as mercury or alcohol. The liquid rises or falls as it expands or contracts according to changes in temperature. See also **air thermometer, clinical thermometer, electronic thermometer, mercury thermometer, rectal thermometer, surface thermometer, tympanic membrane thermometer, wet-and-dry-bulb thermometer.**

thermoneutral environment /-no͞o′trəl/ [Gk, *thermē* + L, *neutralis,* neutral; ME, *environ,* around], **1.** an environment that keeps body temperature at an optimum point at which the least amount of oxygen is consumed for metabolism. **2.** an environment that enables a neonate to maintain a body temperature of 97.7° F (36.5° C) with a minimal requirement of energy and oxygen.

thermonuclear /-no͞o′klē·ər/ [Gk, *thermē,* heat; L, *nucleus,* nut kernel], pertaining to a reaction in which isotopes of hydrogen (protium, deuterium, or tritium) can be fused at temperatures of nearly 100,000,000° C into heavier nuclei of helium atoms. The process is the source of energy of the sun and is used in the explosion of thermonuclear weapons.

thermopenetration /-pen′ətrā′shən/ [Gk, *thermē* + L, *penetrale,* passing through], the use of diathermic techniques to produce warmth within the body tissues for therapeutic purposes. Also called **transthermia.**

thermophilic /-fil′ik/ [Gk, *thermē,* heat, *philein,* to love], pertaining to organisms that thrive in very hot environments (for example, up to 80° C for some bacteria that live in hot springs).

thermophore /thur′məfôr/, a procedure in which heat is applied locally to a body part.

thermoplastic /ther′mō·plas′tik/ [Gk, *thermē,* heat + *plassein,* to mold], softening under heat and capable of being molded into shape with pressure, then hardening on cooling without undergoing chemical change.

thermoradiotherapy /-rā′dē·ōther′əpē/, a therapeutic process that applies ionizing radiation to any part of the body in which the temperature has been raised by artificial means. Thermoradiography seeks to increase the radiosensitivity of the body part being treated.

thermoreceptor /-risep′tər/ [Gk, *thermē,* heat; L, *recipere,* to receive], nerve endings that are sensitive to heat or a rise in body temperature.

thermoregulation^{1} /-reg′yəlā′shən/ [Gk, *thermē* + L, *regula,* rule], the control of heat production and heat loss, specifically the maintenance of body temperature through physiological mechanisms activated by the hypothalamus.

thermoregulation^{2}, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as balance among heat production, heat gain, and heat loss. See also **Nursing Outcomes Classification.**

thermoregulation: newborn, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as balance among heat production, heat gain, and heat loss during the first 28 days of life. See also **Nursing Outcomes Classification.**

thermoregulatory center /-reg′yələtôr′ē/ [Gk, *thermē,* heat; L, *regula,* rule; Gk, *kentron,* center], center located in the hypothalamus concerned mainly with the regulation of heat production, heat inhibition, and heat conservation to maintain a normal body temperature. Kinds of thermoregulatory centers include **thermogenic center, thermoinhibitory center,** and **thermotaxic center.**

thermoresistance /-risis′təns/, an ability to tolerate heat, as in certain thermophilic bacteria.

thermosetting /ther′mō·set·ing/ [Gk, *thermē,* heat; AS, *settan,* to set], of resins, becoming hard or solid when heat is applied and remaining that way on being cooled. The change is not reversible.

thermostable /-stā′bəl/, unaffected by or resistant to change by an increase in temperature. Compare **thermolabile.**

thermostasis /-stā′sis/, maintenance of a stable body temperature, as in mammals and birds.

thermostat /thur′məstat/ [Gk, *thermē* + *statos,* standing], a device for the automatic control of a heating or cooling system. **—thermostatic,** *adj.*

thermotaxic center. See **thermoregulatory center.**

thermotaxis /-tak′sis/ [Gk, *thermē* + *taxis,* arrangement], **1.** the normal adjustment and regulation of body temperature. **2.** the movement of an organism in response to heat, either toward the stimulus (positive thermotaxis) or away from the stimulus (negative thermotaxis). Also called **thermotropism.**

thermotherapeutic penetration /-ther′əpyo͞o′tik/, the depth to which heating to therapeutic temperatures is likely to extend.

thermotherapy /-ther′əpē/ [Gk, *thermē* + *therapeia,* treatment], the treatment of disease by the application of heat. Thermotherapy may be administered as dry heat with heat lamps, diathermy machines, electric pads, or hot water bottles or as moist heat with warm compresses or immersion in warm water. Warm soaks or compresses may be used to treat local infections, relax muscles and relieve pain in patients with motor problems, and promote circulation in peripheral vascular disorders such as thrombophlebitis. **—thermotherapeutic,** *adj.*

thermotropism, moving towards a source of heat. See also **thermotaxis.**

-thermy. See **-therm.**

theta /thē′tə, thā′tə/, Θ, θ, the eighth letter of the Greek alphabet.

theta wave [Gk, *theta,* eighth letter of Greek alphabet; AS, *wafian*], one of the several types of brain waves, characterized by a relatively low frequency of 4 to 7 Hz and a low amplitude of 10 μV. Theta waves are the "drowsy waves" of the temporal lobes of the brain and appear in electroencephalograms when the individual is awake but relaxed and sleepy. Also called *theta rhythm.* Compare **alpha wave, beta wave, delta wave.**

-thetic, -thetical, suffix meaning "to put, place, set": *metathetic, prosthetic, synthetic.*

thiabendazole /thī′əben′dəzōl/, an anthelmintic with anti-inflammatory, antipyretic, and analgesic effects.

■ INDICATIONS: It can be prescribed in the treatment of a range of worm infestations, including hookworms, roundworms, and pinworms, and was the drug of choice for threadworms until recently. Other drugs have fewer adverse effects.

■ CONTRAINDICATIONS: Erythema multiforme, Stevens-Johnson syndrome, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are anorexia, central nervous system effects, severe GI disturbances, dizziness, and hypotension. Approximately one third of people are incapacitated by this drug for several hours after administration.

thiamin. See **thiamine.**

thiaminase /thī·am′inās/, an enzyme present in raw fish that destroys thiamine. A diet containing a substantial amount of raw fish could result in a thiamine deficiency because of the enzyme. A heat-stable form also exists.

thiamine /thī′əmin/ [Gk, *theion,* containing sulfur, *amine,* ammonia], a water-soluble, crystalline compound of the B vitamin complex, essential for normal metabolism and health of the cardiovascular and nervous systems. Thiamine plays a key role in the metabolic breakdown of glucose to yield energy in body tissues. Rich sources are pork; organ meats; green leafy vegetables; legumes; sweet corn; egg yolk; cornmeal; brown rice; yeast; and the germ and husks of grains, berries, and nuts. It is not stored in the body and must be supplied daily. A deficiency of thiamine affects chiefly the nervous system, the circulation, and the GI tract. Symptoms include irritability, emotional disturbances, loss of appetite, multiple neuritis, increased pulse rate, dyspnea, reduced intestinal motility, and heart irregularities. Severe deficiency causes beriberi. Also spelled **thiamin.** Also called **antiberiberi factor, antineuritic vitamin, vitamin B_1.**

thiazide diuretics, a group of diuretics in the thiazide family; they decrease reabsorption of sodium by the kidney and thereby increase loss of water and sodium. They also increase urinary secretion of chloride, potassium, and, to some extent, bicarbonate ions. These are the most frequently prescribed diuretics because they are moderately potent and have relatively few side effects. Most act within 1 hour after being taken and are excreted in 3 to 6 hours. Patients who are taking a thiazide diuretic should be monitored for electrolyte imbalances, metabolic acidosis, and, in the case of diabetic patients, hyperglycemia, which may necessitate an increase in insulin dosage. Because GI irritation can occur, it is advisable to take these diuretics at mealtime. See also **diuretic.**

thiazine-eosinate stain, any of a group of neutral stains used in hematology and histology that combine an eosin dye, usually eosin Y, as the anionic component and one or more thiazine dyes as the cationic component. The prototype is the Romanovsky's stain.

thiemia /thī·ē′mē·ə/ [Gk, *theion,* sulfur, *haima,* blood], an excess of sulfur in the blood.

thiethylperazine /thī·eth′ilper′əzēn/, a phenothiazine antiemetic.

■ INDICATIONS: It is prescribed to control nausea and vomiting.

■ CONTRAINDICATIONS: Parkinson's disease, central nervous system disorders, liver or renal dysfunction, severe hypotension, or known hypersensitivity to phenothiazine medications prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, liver toxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

thiethylperazine malate, the malate salt of thiethylperazine, having the same actions and uses as the base. It is administered intramuscularly.

thiethylperazine maleate, the maleate salt of thiethylperazine, having the same actions and uses as the base. It is administered orally or rectally.

thigh [AS, *theoh*], the section of the lower limb between the hip and the knee.

thigh bone. See **femur.**

thigm-, combining form meaning "touch": *thigmesthesia, thigmocyte, thigmotropic.*

thinking [AS, *thencan,* to think], **1.** the cognitive process of forming mental images or concepts. **2.** the process of cognitive problem solving through the sorting, organizing, and classification of facts. Kinds of thinking include **abstract thinking, concrete thinking,** and **syncretic thinking.** See also **imagination.**

thin-layer chromatography (TLC), a method of separating two or more chemical compounds in a solution through their differential migrations across a thin layer of adsorbent spread over a glass or plastic plate.

thio- /thī′ō-/, prefix designating the presence of sulfur: *thioarsenite, thiocyanate.*

thioamide derivative /thī′ō·am′īd/, one of a group of antithyroid drugs prescribed in the treatment of hyperthyroidism. Thioamide drugs act by inhibiting the synthesis of thyroid hormone. The principal thioamides are propylthiouracil, methimazole, methylthiouracil, and carbimazole; propylthiouracil and methimazole are the only members of this group still available. Adverse reactions include agranulocytosis, hypersensitivity, and a mild transient pruritus. Because agranulocytosis may occur very rapidly, serial white blood cell counts are not useful in diagnosing that complication of treatment. Instead, the patient is requested to report immediately instances of sore throat and fever, which often herald the onset of agranulocytosis. Prompt discontinuation of the drug before serious depletion of granulocytic white blood cells develops usually results in complete recovery. Use of antithyroid medications in pregnancy may result in fetal hypothyroidism, goiter, and cretinism.

thiobarbituric acid /thi′obahr′bitu′rik/, a compound that differs from barbituric acid only by the presence of a sulfur atom instead of an oxygen atom at the number 2 carbon. It is the parent compound of a class of drugs, the thiobarbiturates.

thioctic acid /thī·ok′tik/, a pyruvate oxidation factor found in liver and yeast, used in bacterial culture media.

thioester /thī′ō·es′tər/, an important group of biological chemicals formed by the hydrosulfides (or mercaptans or thiols) and carboxylic acids and identified by a bond between the acyl carbonyl carbon and the thiol sulfur. Examples include the coenzyme A thioesters.

thioethanolamine acetyltransferase /thī′ō·eth′ənol′əmin/, an enzyme that catalyzes the transfer of acetyl groups from acetyl CoA to the sulfur atom of thioethanolamine, producing CoA and *S*-acetylthioethanolamine.

thioflavine T /thī′oflā′vin/, a yellow dye used as a fluorochrome in histopathology.

thioguanine /thī′ōgwä′nēn/, a purine analog antagonist, an antineoplastic that acts as an antimetabolite.

■ INDICATIONS: It is prescribed in the treatment of a variety of malignant neoplastic diseases, especially acute and chronic myelogenous leukemias.

■ CONTRAINDICATIONS: Known hypersensitivity or resistance to this drug prohibits its use. It is not given during pregnancy.

■ ADVERSE EFFECTS: Among the most serious adverse effects are bone marrow depression, GI distress, and stomatitis.

thiopental sodium /-pen′təl/, a formerly widely used, potent, and short-acting barbiturate used as a general anesthetic induction agent. It is administered intravenously in adults. It has no analgesic properties and therefore must be supplemented by analgesics. It has largely been replaced by propofol in the United States. See also **barbiturate.**

thioridazine hydrochloride /-rid′əzēn/, a phenothiazine antipsychotic.

■ INDICATIONS: It is prescribed in the treatment of schizophrenia when patients have failed to respond to other therapies and in the management of nonpsychotic behavioral disturbances, senility, alcohol withdrawal, and organic brain disease.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, hepatic or renal dysfunction, severe hypotension, or known hypersensitivity to this drug or to other phenothiazine medications prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are severe sedation, a potentially life-threatening prolongation of the QT interval, hypotension, hepatotoxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions. It should be used with caution in patients with premature ventricular contractions, breast cancer, and respiratory disorders and in patients exposed to extreme heat, cold, and pesticides or insecticides. The herb kava kava may increase the risk and severity of dystonic reactions.

thiotepa /thī′ōtep′ə/, an antineoplastic alkylating agent.

■ INDICATIONS: It is prescribed in the treatment of malignant neoplastic diseases, including adenocarcinoma of the breast and ovary, and urinary bladder carcinomas.

■ CONTRAINDICATIONS: Bone marrow depression, pregnancy, or known hypersensitivity to this drug prohibits its use. Dosage must be decreased if there is liver or kidney dysfunction.

■ ADVERSE EFFECTS: Among the most serious adverse effects are bone marrow depression, anorexia, nausea, and headache.

thiothixene /-thī′ksēn/, a thioxanthene antipsychotic.

■ INDICATIONS: It is prescribed in the treatment of acute agitation and mild-to-severe psychotic disorders.

■ CONTRAINDICATIONS: Parkinson's disease, concurrent administration of central nervous system depressants, hepatic or renal dysfunction, severe hypotension, or known hypersensitivity to this drug or to phenothiazine medications prohibits its use. It is not recommended for children under 12 years of age.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, hepatotoxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

thiouracil /thī′ōyo͞or′əsil/ [Gk, *theion,* sulfur, *ouron,* urine], a chemical compound derived from thiourea that inhibits the formation of thyroxine in the thyroid gland and is used to treat hyperthyroidism.

thioxanthene derivative /thī·oksan′thēn/, any one of a group of antipsychotic drugs, each of which is similar to the phenothiazines in indication, action, and adverse effects.

third cranial nerve. See **oculomotor nerve.**

third cuneiform bone. See **lateral cuneiform bone.**

third-degree AV heart block. See **complete heart block.**

third-degree burn, a burn that destroys both the epidermis and the dermis, often also involving the subcutaneous tissue. Also called *full-thickness burn.*

third-party reimbursement, reimbursement for services rendered to a person in which an entity other than the receiver of the service is responsible for the payment. Third-party reimbursement for the cost of a subscriber's health care is commonly paid in full or in part by a health insurance plan, such as Blue Shield or Blue Cross, Medicare, or Medicaid.

third stage of labor, the expulsion of the placenta, membranes, and a small amount of blood and amniotic fluid, occurring within 5 to 30 minutes after delivery of the fetus.

third ventricle [Gk, *triotus,* below second rank; L, *ventriculus,* little belly], a cavity of the brain bounded on each side by a thalamus and the hypothalamus. It communicates anteriorly with the lateral ventricles and posteriorly with the aqueduct of the midbrain.

third ventriculostomy /ventrik′yəlos′təmē/ [L, *tertius,* three, *ventriculus,* little belly; Gk, *stoma,* mouth], a surgical procedure for draining cerebrospinal fluid into the cisterna chiasmatis of the subarachnoid space in hydrocephalus, usually in the newborn. The procedure is not commonly performed and is used chiefly when the cisterna magna is not available for ventriculocisternostomy. The third ventriculostomy makes an opening on the anterior wall of the floor of the third ventricle into the interpeduncular cistern and is performed to correct an obstructive type of hydrocephalus.

thirst /thurst/ [AS, *Thurst*], a perceived desire for water or other fluid. The sensation of thirst is usually referred to the mouth and throat.

Thiry-Vella fistula /thī′rē vel′ə/ [Ludwig Thiry, Austrian physiologist, 1817–1897; Luis Vella, Italian physiologist, 1825–1886], an artificial passage from the abdominal surface of an experimental animal to an isolated intestinal loop, created surgically for the study of intestinal secretions. The continuity of the animal's gut is restored by anastomosis of the severed sections, and the vascular connections and mesenteric attachment of the isolated loop are preserved. The ends of the isolated segment are attached to two openings in the skin of the abdomen to form a closed internal loop.

thixo-, prefix meaning "touch": *thixolabile, thixotropic, thixotropy.*

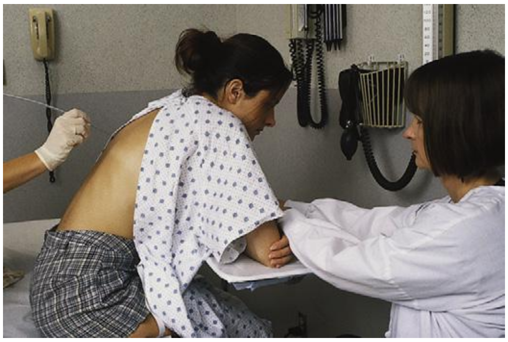
thixotropy /thiksot′rəpē/ [Gk, *this,* touch, *terpin,* to turn], a property of certain gels or colloids that become less viscous when shaken or agitated but revert to their original viscosity after standing.

Thomas' splint [Hugh O. Thomas, English surgeon, 1834–1891], **1.** a rigid splint constructed of steel bars that are curved to fit the involved limb and are held in place by a cast or a rigid bandage. It is used in the treatment of chronic joint diseases. **2.** a rigid metal splint that extends from a ring at the hip to beyond the foot. It is used to treat a fractured leg and, in conjunction with various traction and suspension devices, to immobilize and position a fractured femur in a preoperative or postoperative patient. Also called *Thomas' knee splint, Thomas' ring splint.*

Thompson scattering. See **scattering.**

Thomsen's disease. See **myotonia congenita.**

thoracentesis /thôr′əsentē′sis/ [Gk, *thorax* + *centesis,* puncture], the surgical perforation of the chest wall and pleural space with a needle to aspirate fluid for diagnostic or therapeutic purposes or to remove a specimen for biopsy. The procedure is usually performed using local anesthesia, with the patient in an upright position. Thoracentesis may be used to aspirate fluid to treat pleural effusion or to collect fluid samples for culture or examination. Also called **thoracocentesis.**



Common position for thoracentesis
(Harkreader, Hogan, and Thobaben, 2007)

thoraces. See **thorax.**

thoracic. See **thorax.**

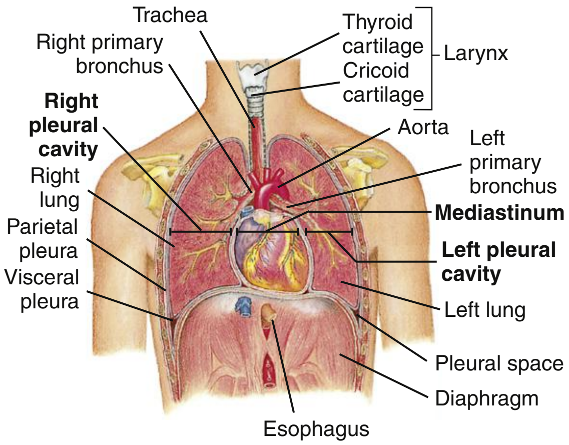
-thoracic, suffix meaning "the chest": *abdominothoracic, extrathoracic, intrathoracic*.

thoracic actinomycotics. See **actinomycosis.**

thoracic aorta [Gk, *thorax,* chest, *aerein,* to raise], the large upper part of the ascending arch and descending aorta, supplying many parts of the body, such as the heart, ribs, chest muscles, and stomach. Its branches include the coronary brachiocephalic, left common carotid artery, left subclavian, pericardial, bronchial, esophageal, mediastinal, posterior intercostal, subcostal, and superior phrenic. See also **descending aorta.** Compare **abdominal aorta.**

thoracic cage [Gk, *thorax,* chest; L, *cavus,* hollow], the bony framework that surrounds the organs and soft tissues of the chest. It consists of 12 thoracic vertebrae, 12 pairs of ribs, and the sternum.

thoracic cavity [Gk, *thorax,* chest; L, *cavum*], the cavity enclosed by the ribs, the thoracic part of the vertebral column, the sternum, the diaphragm, and associated muscles.



Thoracic cavity *(Thibodeau and Patton, 2003)*

thoracic constriction of esophagus, a narrowing of the thoracic esophagus where it is compressed by the aortic arch and the left main bronchus.

thoracic duct, the common trunk of all the lymphatic vessels in the body, except those on the right and left sides of the head, the neck, and the thorax; the upper abdominal wall; the right and left upper limbs; the right and left lungs; the right side of the heart; and the diaphragmatic surface of the liver. In the adult it is 38 to 45 cm long and 3 to 5 mm in diameter. Also called **alimentary duct.** Compare **right lymphatic duct.** See also **lymphatic system.**

thoracic fistula, an abnormal opening in the chest wall that ends blindly or communicates with the thoracic cavity.

thoracic kyphosis, the dorsally convex curve formed by the thoracic spinal column when seen from the side. Also called *thoracic curvature*.

thoracic medicine, the branch of medicine concerned with the diagnosis and treatment of disorders of the structures and organs of the chest, especially the lungs.

thoracic nerves, the 12 pairs of spinal nerves emerging from the spinal cord at the level of the thorax, including 11 intercostal nerves and one subcostal nerve. They are distributed mainly to the walls of the thorax and the abdomen. The thoracic nerves do not enter a plexus but follow independent courses, making them different from other spinal nerves. The first two intercostal nerves innervate the upper limb and the thorax; the next four supply only the thorax; and the lower five supply the walls of the thorax and the abdomen. Each subcostal thoracic nerve innervates the abdominal wall and the skin of a buttock. See also **autonomic nervous system.**

thoracic outlet syndrome, an abnormal type of mononeuropathy characterized by paresthesia. It may be caused by a nerve root compression by a cervical disk.

thoracic parietal node, one of the lymph glands in the thorax associated with various lymphatic vessels and divided into sternal nodes, intercostal nodes, and diaphragmatic nodes. See also **lymphatic system, lymph node.**

thoracic spine, that part of the spine comprising the thoracic vertebrae.

thoracic surgery [Gk, *thorax,* chest, *cheirourgia,* surgery], the branch of medicine that deals with disease and injuries of the thoracic area by manipulative and operative methods.

thoracic vertebra, one of the 12 bony segments of the spinal column of the upper back designated T1 to T12 or D1 to D12. T1 is just below the seventh cervical vertebra (C7), and T12 is just above the first lumbar vertebra (L1). The thoracic part of the spine is flexible and has a concave ventral curvature. Each vertebra has a broad thick lamina; long, obliquely directed spinous processes; and thick strong articular facets. The thoracic vertebrae are unique in having small lateral facets for articulation with the ribs. The vertebrae are separated from each other by intervertebral disks. The vertebrae become thicker and heavier in descending order from T1 to T12. Compare **cervical vertebra, lumbar vertebra, sacral vertebra.**

thoracic visceral node, a node in the three groups of lymph nodes connected to the part of the lymphatic system that serves certain structures within the thorax, such as the liver, sternum, thymus, pericardium, esophagus, trachea, lungs, diaphragm, and bronchi. The thoracic visceral nodes include the **anterior mediastinal nodes, posterior mediastinal nodes,** and *tracheobronchial nodes*. Compare **thoracic parietal node.** See also **lymph, lymphatic system, lymph node.**

thoracic wall, the musculoskeletal wall of the thorax, consisting of the 12 thoracic vertebrae, the ribs, and the sternum, as well as the intercostals muscles, the subcostales, and the transversus thoracis.

thoraco- /thôr′əkō-/, prefix meaning "the chest": *thoracobronchotomy, thoracocentesis, thoracomyodynia*.

thoracoacromial artery, a short artery originating from the anterior surface of the second part of the axillary artery. It divides into four branches: the pectoral, deltoid, clavicular, and acromial.

thoracocentesis. See **thoracentesis.**

thoracodorsal nerve /thôr′əkōdôr′səl/ [Gk, *thorax* + L, *dorsum,* back], the middle subscapular nerve, a branch of the brachial plexus, usually arising between the upper and lower subscapular nerves. It courses along the posterior wall of the axilla and terminates in branches that supply the latissimus dorsi.

thoracodynia /-din′ē·ə/ [Gk, *thorax,* chest, *odyne,* pain], chest pain.

thoracolumbar fascia /thôr′əkōlum′bər/, a noncontractile structure that functions in a manner similar to a ligament in the lumbar area. It extends from the iliac crest and sacrum to the thoracic cage and envelops the paravertebral musculature. See also **lumbodorsal fascia.**

thoracolumbar junction, the part of the vertebral column from the eleventh thoracic vertebra to the first lumbar vertebra. Here the spinal curvature changes from kyphosis to lordosis and the orientation of the facet joints changes from coronal to sagittal.

thoracolumbosacral orthosis (TLSO) /thôr′əkōlum′bō sā′krəl/ [Gk, *thorax,* chest; L, *lumbus,* loin + *sacrum,* sacred], a spinal orthosis that runs from the thoracic spine caudal to the lumbosacral region and thus limits movement of the thoracic and lumbar spine. Different types vary in rigidity and in the kind of support given to the thorax. See also **body jacket.**

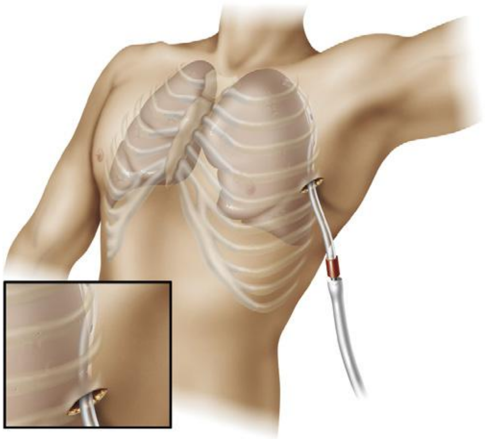
thoracopathy /thôr′əkop′əthē/, any disorder involving the thorax or the organs it contains.

thoracoplasty /thôr′əkoplas′tē/, the surgical reduction in the size of abnormal spaces in the thoracic cavity, such as may result from a collapsed lung.

thoracoscopy, an endoscopic procedure used to directly visualize the pleura, lungs, and mediastinum and to obtain tissue for testing. It is also helpful in staging and dissection of lung cancers.

thoracostomy /thôr′əkos′təmē/ [Gk, *thorax* + *stoma,* mouth], an incision made into the chest wall to provide an opening for the purpose of drainage.

thoracostomy tube, a catheter inserted through the chest wall to drain fluid from the pleural space.

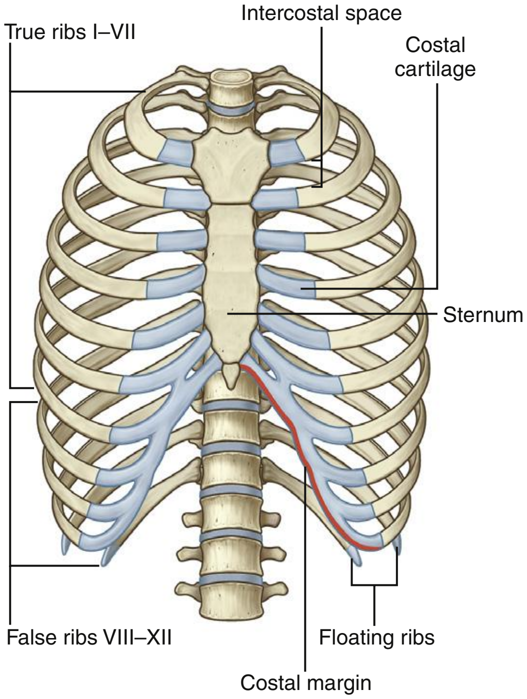


Thoracostomy tube *(Custalow, 2005)*

thoracotomy /thôr′əkot′əmē/ [Gk, *thorax* + *temnein,* to cut], a surgical opening into the thoracic cavity. See also **anterolateral thoracotomy, median sternotomy, posterolateral thoracotomy.**

Thoraeus filters /thôrē′əs/, a combination of metals, usually tin, copper, and aluminum, used to modify the quality of orthovoltage x-ray beams and thus improve their penetrating ability.

thorax /thôr′aks/ *pl.* **thoraxes, thoraces** [Gk, chest], the upper part of the trunk or cage of bone and cartilage containing the principal organs of respiration and circulation and covering part of the abdominal organs. It is formed ventrally by the sternum and costal cartilages and dorsally by the 12 thoracic vertebrae and the dorsal parts of the 12 ribs. The thorax of women has less capacity, a shorter sternum, and more movable upper ribs than that of men. Also called **chest.** **—thoracic,** *adj.*



Thorax *(Drake, Vogl, and Mitchell, 2010)*

Thorazine, a trademark for a phenothiazine antiemetic and tranquilizer **(chlorproMAZINE).**

thorium (Th) /thôr′ē·əm/ [ONorse, *Thor,* god of thunder], a heavy grayish radioactive metallic element. Its atomic number is 90; its atomic mass (weight) is 232.04. Thorium is used in nuclear medicine and in radiation therapy.

thought broadcasting /thôt/ [AS, *thot*], a symptom of psychosis in which the patient believes that his or her thoughts are “broadcast” beyond the head so that other people can hear them.

thought insertion, a belief by some mentally ill patients that thoughts of other people can be inserted into their own minds. See also **schizophrenia.**

thought transference. See **telepathy.**

THP, abbreviation for **Tamm-Horsfall protein.**

Thr, abbreviation for **threonine.**

threadworm. See ***Enterobius vermicularis, Acanthocheilonema perstans.***

threadworm infection. See **strongyloidiasis.**

thready pulse /thred′ē/ [AS, *thraed* + L, *pulsare,* to beat], an abnormal pulse that is weak, somewhat difficult to palpate, and often fairly rapid. The artery does not feel full, and the rate may be difficult to count. It is characteristic of hypovolemia, such as occurs with severe hemorrhage.

threatened abortion /thret′ənd/ [AS, *threat,* coercion; L, *ab,* away from, *oriri,* to be born], a condition in pregnancy before the twentieth week of gestation characterized by uterine bleeding and cramping sufficient to suggest that miscarriage may result. A threatened abortion is generally managed with rest and observation. Compare **incomplete abortion, inevitable abortion.**

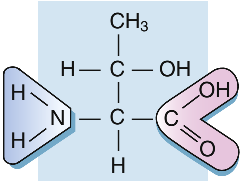
three-day fever. See **phlebotomus fever.**

3-day measles. See **rubella.**

3*n*, abbreviation for **triploid.**

three-point gait [Gk, *treis* + L, *pungere,* to prick; ONorse, *gata,* way], a pattern of crutch-walking in which the crutches and affected leg are advanced together, alternating with the unaffected leg.

threonine (Thr), an essential amino acid needed for proper growth in infants and maintenance of nitrogen balance in adults. See also **amino acid, protein.**



Chemical structure of threonine

threp-, prefix meaning "nutrition": *threpology, threpsis, threptic.*

threshold /thresh′ōld/ [AS, *therscold*], the point at which a stimulus is great enough to produce an effect. For example, a pain threshold is the point at which a person becomes aware of pain.

threshold dose [AS, *therscold* + Gk, *dosis,* giving], **1.** a measure of a dose of radiation exposure defined in terms of conditions needed to produce a visible erythema in a given proportion of people exposed. Also called **minimal erythema dose, skin erythema dose,** *threshold erythema dose.* **2.** the minimum dose of a drug needed to produce a measurable response. Administration of drugs at dosages of intervals that do not maintain concentration about the threshold level wastes the medication and, in cases such as antibiotic treatment or cancer chemotherapy, can have additional adverse consequences resulting from the selective growth of cancer cells or microorganisms that are more resistant to the medication.

threshold limit values, the maximum concentration of a chemical to which workers can be exposed for a fixed period, such as 8 hours per day, without developing a physical impairment.

threshold of consciousness [AS, *therscold* + L, *conscire,* to be aware], the lowest limit of perception of a stimulus.

threshold stimulus [AS, *therscold* + L, *stimulare,* to incite], a stimulus that is just sufficient to produce a response. Below that level, no action or response is likely without additional intensity of the stimulus. Also called **limen, liminal stimulus.**

thrill [AS, *thyrlian,* to pierce], a fine vibration, felt by an examiner's hand on a patient's body over the site of an aneurysm or on the precordium, resulting from turmoil in the flow of blood and indicating the presence of an organic murmur of grade 4 or greater intensity. A thrill can also be felt over the carotids if a bruit is present and over an arteriovenous fistula in the patient undergoing hemodialysis. Compare **bruit, murmur.**

thrix /thriks/ [Gk], hair.

throat. See **pharynx.**

throat and nose cultures, a microscopic examination used to isolate and identify pathogens such as streptococci, meningococci, gonococci, *Bordetella pertussis,* and *Corynebacterium diphtheriae.* Identification of streptococci is particularly important in a throat culture because rheumatic heart disease or glomerulonephritis may follow a streptococcal pharyngitis. Nasopharyngeal cultures are often done to screen for infections and carrier states caused by various other organisms such as *Staphylococcus aureus, Haemophilus influenzae, Neisseria meningitidis,* respiratory syncytial virus (RSV), and viruses causing rhinitis.

throb [ME, *throbben,* to beat intensely], a deep, pulsating kind of discomfort or pain. **—throbbing,** *adj., n.*

thrombapheresis. See **plateletpheresis.**

thrombasthenia /throm′basthē′nē·ə/ [Gk, *thrombos,* lump, *a* + *sthenos,* not strength], decreased platelet function. See **Glanzmann thrombasthenia.**

thrombectomy /thrombek′təmē/ [Gk, *thrombos* + *ektomē,* excision], the removal of a thrombus from a blood vessel, performed as emergency surgery to restore circulation to the affected part. Anticoagulant therapy may begin before surgery. An arteriogram is done to locate the thrombus. During surgery a longitudinal incision is made into the blood vessel, and the clot is removed. After surgery the blood pressure is maintained close to its preoperative level because a decrease would predispose to further clotting. Compare **embolectomy.**

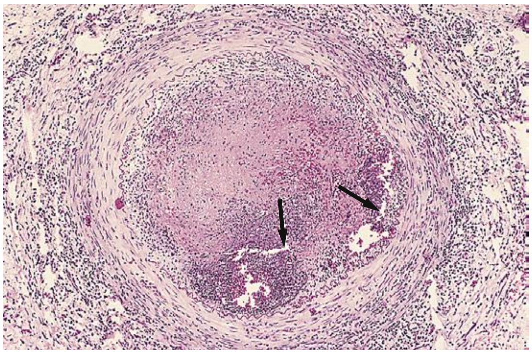
thrombi. See **thrombus.**

thrombin /throm′bin/, the key enzyme produced during coagulation by activation of prothrombin. Thrombin converts fibrinogen to fibrin, activates factors V, VIII, XI, and XIII, and causes platelet aggregation. See also **blood clot, prothrombin.**

thrombo- /throm′bō-/, prefix meaning "clot": *thromboarteritis, thrombocystis, thrombolysis.*

thromboangiitis /throm′bō·an′jē·ī′tis/, an inflammation of the blood vessels associated with thrombosis and accompanied by destruction of the intima.

thromboangiitis obliterans [Gk, *thrombos* + *angeion,* vessel, *itis,* inflammation; L, *obliterare,* to cancel], an occlusive vascular condition, usually of a leg or a foot, in which the small and medium-sized arteries become inflamed and thrombotic. Early signs of the condition are burning, numbness, and tingling of the foot or leg distal to the lesion. Phlebitis and gangrene may develop as the disease progresses. Pulsation in the limb below the damaged blood vessels is often absent. The goal of therapy is to avoid all factors that decrease the blood supply to the extremity, such as cigarette smoking, and to use all means possible to increase the supply. Amputation may be necessary if the condition progresses to gangrene with chronic infection and extensive tissue destruction. Men are affected more often than women; most affected men smoke and are between 20 and 40 years of age. Also called **Buerger's disease.**



Thromboangiitis obliterans *(Kumar et al, 2007)*

thromboarteritis /throm′bō·är′tərī′tis/, arterial inflammation with thrombus formation.

thrombocyst /throm′bəsist/, a membranous sac enclosing a thrombus.

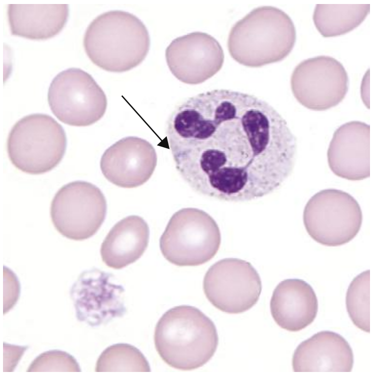
thrombocyt-, prefix meaning "platelet": *thrombocytopenia, thrombocytosis.*

thrombocyte. See **platelet.**

thrombocythaemia, thrombocythemia. See **thrombocytosis.**

thrombocytopathy /throm′bōsītop′əthē/ [Gk, *thrombos* + *kytos,* cell, *pathos,* disease], any disorder of the blood coagulation mechanism caused by an abnormality or dysfunction of platelets. Kinds of thrombocytopathies include **thrombocytopenia** and **thrombocytosis. —thrombocytopathic,** *adj.*

thrombocytopenia /throm′bōsī′təpē′nē·ə/ [Gk, *thrombos* + *kytos* + *penia,* poverty], a platelet count below the lower limit of the reference interval, usually 150,000/uL. It may be the consequence of decreased production disorders such as acute leukemia, an idiosyncratic drug response, or increased consumption, such as immune thrombocytopenic purpura. Thrombocytopenia is the most common cause of mucocutaneous (systemic) bleeding. Also called **thrombopenia.**



Thrombocytopenia *(Carr and Rodak, 2008)*

thrombocytopenia–absent radius syndrome, an autosomal-recessive syndrome consisting of thrombocytopenia associated with absence or hypoplasia of the radius and sometimes congenital heart disease and renal anomalies. Also called **TAR syndrome.**

thrombocytosis /throm′bōsītō′sis/ [Gk, *thrombos* + *kytos* + *osis,* condition], an abnormal increase in the number of platelets in the blood. **Benign thrombocytosis,** or **secondary thrombocytosis,** is asymptomatic and usually occurs after splenectomy, inflammatory disease, hemolytic anemia, hemorrhage, or iron deficiency; as a response to exercise; after chemotherapy; in chronic myelogeneous leukemia; or in advanced carcinoma, Hodgkin's disease, or other lymphomas. **Essential thrombocythemia** is characterized by episodes of spontaneous bleeding alternating with thrombotic episodes. The platelets may reach levels exceeding 1,000,000/μL. Compare **thrombocytopenia.** See also **polycythemia.**

thromboembolic disorder (TED) hose. See **antiembolism hose.**

thromboembolism /-em′bəliz′əm/ [Gk, *thrombos* + *embolos,* plug], a condition in which a blood vessel is obstructed by a blood clot (thrombus) carried in the bloodstream from its site of formation. The area supplied by an obstructed artery may tingle and become cold, numb, and cyanotic. Treatment includes quiet bed rest, warm wet packs, and anticoagulants to prevent the formation of additional thrombi. Embolectomy may be indicated, especially if the aorta or common iliac artery is obstructed. A thromboembolus in the lungs causes a sudden, sharp thoracic or upper abdominal pain, dyspnea, cough, fever, anxiety, hemoptysis, and associated electrocardiogram changes. Obstruction of the pulmonary artery or one of its main branches may be fatal. Thromboemboli are diagnosed by x-ray films, CT pulmonary angiograms, and other radiological techniques, including lung scans and angiography.

thromboendarterectomy /-en″därtərek′təmē/, removal of thrombus and atherosclerotic inner lining from an obstructed artery.

thrombogenesis /-jen′əsis/, formation of a thrombus or blood clot.

thrombogenic /-jen′ik/ [Gk, *thrombos* + *genein,* to produce], pertaining to a thrombus or a factor that causes a thrombus.

thromboid /throm′boid/, **1.** clotlike. **2.** resembling a thrombus.

thrombokinase. See **factor X.**

thrombolysis /thrombol′isis/, the dissolution of a thrombus.

thrombolytic /-lit′ik/ [Gk, *thrombos* + *lysis,* a loosening], pertaining to a drug or another agent that dissolves a thrombus.

thrombolytic therapy (TT), administration of a thrombolytic agent such as tissue plasminogen activator, urokinase, or streptokinase to dissolve an arterial clot, such as a clot in a coronary artery in a patient with an acute myocardial infarction. TT is also used to dissolve clots (thrombi) in venous access devices.

thrombolytic therapy management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of patient data to expedite safe, appropriate provision of an agent that dissolves a thrombus. See also **Nursing Interventions Classification.**

thrombopathy /thrombop′əthē/, a condition in which a clotting ability is deficient for reasons other than thrombocytopenia.

thrombopenia /-pē′nē·ə/ [Gk, *thrombos,* lump, *penia,* poverty]. See **thrombocytopenia.**

thrombopenic purpura. See **hemorrhagic purpura.**

thrombophilia, increased risk of thrombosis secondary to an acquired or inherited thrombotic risk factor.

thrombophlebitis /-fləbī′tis/ [Gk, *thrombos* + *phleps,* vein, *itis,* inflammation], inflammation of a vein accompanied by the formation of a clot. It occurs most commonly as the result of trauma to the vessel wall; hypercoagulability of the blood; infection; chemical irritation; postoperative venous stasis; prolonged sitting, standing, or immobilization; or a long period of IV catheterization. Also called **phlebitis.**

■ OBSERVATIONS: Thrombophlebitis of a superficial vein is generally evident; the vessel feels hard and thready or cordlike and is extremely sensitive to pressure; the surrounding area may be erythematous and warm to the touch, and the entire limb may be pale, cold, and swollen. Deep vein thrombophlebitis is characterized by aching or cramping pain, especially in the calf, when the patient walks or dorsiflexes the foot (Homans' sign).

thrombophlebitis migrans. See **migratory thrombophlebitis.**

thrombophlebitis purulenta, inflammation of a vein associated with the formation of a soft, purulent thrombus that infiltrates the wall of the vessel.

thromboplastic /-plas′tik/, **1.** causing clot formation. **2.** pertaining to the role of thromboplastin in forming a clot.

thromboplastin, a plasma protein that initiates the clotting process by converting prothrombin to thrombin in the presence of calcium ions.

thrombosed /throm′bōst/, **1.** clotted. **2.** pertaining to a blood vessel in which a thrombus has formed.

thrombosis /thrombō′sis/, *pl.* **thromboses,** an abnormal condition in which a clot (thrombus) develops within a blood vessel. See also **blood clotting.** **—thrombotic,** *adj.*

thrombosis indicator test, a blood test to support a diagnosis of disseminated intravascular coagulation and to indicate the effectiveness of anticoagulation therapy.

thrombotapheresis. See **plateletpheresis.**

thrombotic microangiopathy, the formation of thrombi in the arterioles and capillaries, as occurs in **thrombotic thrombocytopenic purpura** and *hemolytic uremia syndrome*.

thrombotic phlegmasia. See **phlegmasia alba dolens.**

thrombotic thrombocytopenic purpura (TTP) [Gk, *thrombos,* lump, *thrombos* + *kytos,* cell, *penia,* poverty; L, *purpura,* purple], a disorder characterized by thrombocytopenia, hemolytic anemia, and neurological abnormalities. It is accompanied by a generalized purpura with the deposition of microthrombi within the capillaries and smaller arterioles. It includes a chronic form and an acute fulminating form that may be fatal in weeks. Therapy includes corticosteroids, splenectomy, and therapeutic plasma exchange. Compare **disseminated intravascular coagulation.**

thromboxane, any of several compounds synthesized by platelets and other cells that cause platelet aggregation and vasoconstriction.

thromboxane-A synthase, an enzyme that catalyzes the conversion in platelets of prostaglandin G_2 to thromboxane A_2. A deficiency of the enzyme causes a defect in the release of platelets. See also **thromboxane A_2.**

thromboxane A_2 (TXA$_2$) /thrombok′sān/, biologically active compound derived from prostaglandin G_2 with a 30-second half-life. It increases in concentration after injury to blood vessels and stimulates the primary hemostatic response and irreversible platelet aggregation.

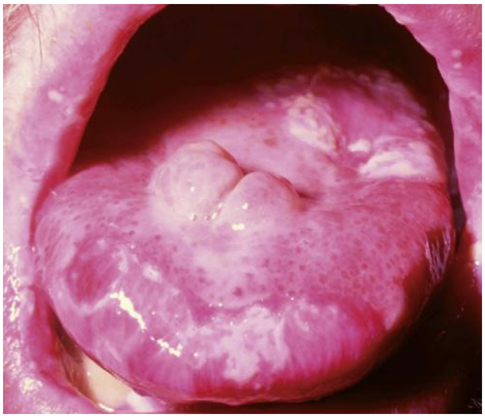
thromboxane B_2 (TXB$_2$), a stable metabolite of thromboxane A_2 that has an effect on polymorphonuclear cells and may possess chemotactic activity. It is released during anaphylaxis in laboratory animals. See also **thromboxane A_2.**

thrombus /throm′bəs/ *pl.* **thrombi** [Gk, *thrombos,* lump], **1.** an aggregation of platelets, fibrin, and red blood cells that attaches to the interior wall of a vein or artery, sometimes occluding the lumen of the vessel. Kinds of thrombi include **agonal thrombus, hyaline thrombus, laminated thrombus,** and **white thrombus.** Compare **embolus.** **2.** a blood clot

through-and-through drainage /thro͞o/ [ME, *thurgh* + AS, *drachen,* tear drop], a method of irrigating a body organ by inserting two tubes, one to introduce the fluid and another to drain the fluid that accumulates within the organ.

through transmission, a type of ultrasound imaging in which the sound field is transmitted through a specimen and the transmitted energy is picked up on a far surface by a receiving transducer.

thrush [Dan, *troeske,* dryness], candidiasis of the tissues of the mouth. The condition is characterized by the appearance of creamy white patches of exudate on an inflamed tongue or buccal mucosa. It is usually a benign condition in normal children but may be a sign of human immunodeficiency virus infection. See also **candidiasis, stomatitis parasitica.**



Thrush *(Marks and Miller, 2006)*

thulium (Tm) /tho͞o′lē·əm/ [L, *Thule,* northern island], a rare earth metallic element. Its atomic number is 69; its atomic mass is 168.93. Thulium that has been irradiated in a nuclear reactor gives off gamma radiation.

thumb /thum/ [AS, *thuma*], the first, most lateral digit on the radial side of the hand, classified by most anatomists as one of the fingers because its metacarpal bone ossifies in the same manner as those of the phalanges. Other anatomists classify the thumb separately, noting that it has a much different articulation with the metacarpal bone (a saddle joint) and is composed of one metacarpal bone and only two phalanges. The nerves that innervate the various muscles controlling the thumb include branches of the radial nerve, branches of the median nerve, and the deep palmar branch of the ulnar nerve.

thumb forceps, a surgical instrument used to grasp soft tissue, especially while suturing. Also called **tissue forceps.**

thumb sign [AS, *thuma* + L, *signum*], the flexing of the terminal phalanx of the thumb against the flexed index finger, as in holding a piece of paper. It is observed in patients who are unable to adduct the thumb because of an ulnar lesion. Also called **Froment's sign, newspaper sign, signe de journal.**

thumbsucking, the habit of sucking the thumb for oral gratification. It is normal in infants and young children as a pleasure-seeking or comforting device, especially when the child is hungry or tired. The habit reaches its peak when the child is between 18 and 20 months of age, and it normally disappears as the child develops and matures. Thumbsucking beyond 4 to 6 years of age may lead to malocclusion of the teeth and deformation of the bony tissue of the thumb. Excessive thumbsucking, especially in older children, may be indicative of some emotional problem.

thumps, **1.** hiccups. **2.** spasmodic contractions of the diaphragm.

thyme /tīm, thim/ [Gk, *thymon*], the dried leaves and flowering tops of the herb *Thymus vulgaris,* which produces a pungent mintlike aroma. It is the source of a volatile oil, tannin, and gum, but is used mainly as a flavoring agent.

thymectomy /thīmek′təmē/ [Gk, *thymus*], the surgical removal of the thymus.

thymi. See **thymus.**

-thymia, suffix meaning "(condition of the) mind or will": *amphithymia, barythymia, poikilothymia*.

thymic /thī′mik/, pertaining to the thymus gland.

thymic hypoplasia, thymic parathyroid aplasia. See **DiGeorge's syndrome.**

thymidine (dThd) /thī′mədēn/, one of the four major nucleosides in DNA. It is formed by the condensation of thymine with deoxyribose.

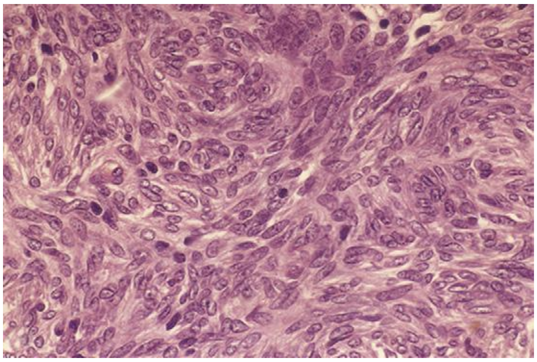
thymidine kinase, an enzyme of the transferase class that catalyzes a phosphorylation reaction of pyrimidine salvage and phosphorylation of drugs, such as acyclovir and ganciclovir, into a form that will be active against viruses.

thymine, a pyrimidine base in animal cells usually occurring condensed with deoxyribose to form the nucleoside deoxythymidine, a component of deoxyribonucleic acid. See also **cytosine, guanine, uracil.**

thymo-, **1.** prefix meaning "thymus gland": *thymocyte, thymolysis, thymoma*. **2.** combining form meaning "the spirit or mind": *thymogenic, thymopathy, thymopsyche*.

thymol /thī′mol/, a synthetic or natural thyme oil, used as an antibacterial and antifungal, that is an ingredient in some over-the-counter preparations for the treatment of hemorrhoids, acne, and tinea pedis. It is also used as a stabilizer in various pharmaceutic preparations.

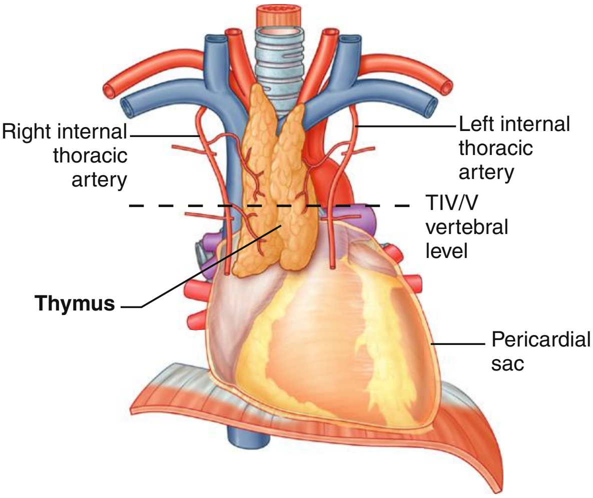
thymoma /thīmō′mə/ *pl.* **thymomas, thymomata** [Gk, *thymos,* thyme, flowers, *oma,* tumor], a usually benign tumor of the thymus gland that may be associated with myasthenia gravis or an immune deficiency disorder.



Benign thymoma *(Kumar et al, 2010)*

thymosin /thī′məsin/, **1.** a naturally occurring immunological hormone secreted by the thymus gland. It is present in greatest amounts in young children and decreases in amount throughout life. **2.** an investigational drug derived from bovine thymus extracts and prescribed as an immunomodulator in experimental treatments for certain diseases such as systemic lupus erythematosus or rheumatoid arthritis.

thymus /thī′məs/ *pl.* **thymuses, thymi** [Gk, *thymos,* thyme, flowers], a single unpaired lymphoid organ that is located in the mediastinum, extending superiorly into the neck to the lower edge of the thyroid gland and inferiorly as far as the fourth costal cartilage. The thymus is the primary central gland of the lymphatic system. The endocrine activity of the thymus is believed to depend on the hormone thymosin, which is composed of biologically active peptides critical to the maturation and the development of the immune system. The T cells of the cell-mediated immune response develop in this gland before migrating to the lymph nodes and spleen. The gland consists of two lateral lobes closely bound by connective tissue, which also encloses the entire organ in a capsule. Superficial to the gland is the sternum. Lying deep to the thymus are the great vessels and the cranial part of the pericardium. The two lobes of the gland differ in size, and in many individuals the right lobe overlaps the left lobe. The thymus is about 5 cm long, 4 cm wide, and 6 mm thick. The lobes are composed of numerous lobules, which are separated by delicate connective tissue. Each lobule is composed of a dense cellular cortex and an inner, less dense medulla. The thymus develops in the embryo from the third branchial pouch and increases in size until attaining a weight of 12 to 14 g before birth. The size of the organ relative to the rest of the body is largest when the individual is about 2 years of age. The thymus usually attains its greatest absolute size at puberty, when it weighs about 35 g. After puberty the organ undergoes involution. With aging the gland may change from pinkish-gray to yellow and in the elderly individual may appear as small islands of thymic tissue covered with fat and surrounded by the yellowish capsule. The normal involution of the thymus may be superseded by rapid accidental involution caused by starvation or by acute disease. Compare **spleen.**



Thymus *(Drake, Vogl, and Mitchell, 2010)*

thymus-dependent antigen, an antigen that requires the interaction between T and B cells to initiate antibody production.

thymus-independent antigen, an antigen that induces antibody (immunoglobulin M) production without direct cooperation from T cells.

Thyrar, a trademark for **thyroid hormone.**

-thyrea, -thyreosis, -thyroidism, suffix meaning a "condition of the thyroid gland": *athyrea, hypothyrea, hyperthyrea*.

thyro- /thī′rō-/, **thyroido-, thyreo-,** prefix meaning "a shield or pertaining to the thyroid gland": *thyroactive, thyroidectomy, thyroiditis*.

thyroaplasia /thī′rō·aplā′zhə/, variations in any of several defects in the thyroid gland and deficiencies of its secretions.

thyroarytenoid muscles, two broad, flat muscles lateral to the fibroelastic membrane of the larynx and the laryngeal entricles and saccules. Each muscle runs from a vertical line of origin on the lower half of the thyroid angle and adjacent external surface of the cricothyroid ligament to the anterolateral surface of the arytenoid cartilage. Some of the fibers may continue into the aryepiglottic fold and reach the margin of the epiglottis. They act as sphincters to the laryngeal vestibule and also narrow the laryngeal inlet. They are innervated by the recurrent laryngeal branches of the vagus nerves.

thyrocalcitonin. See **calcitonin.**

thyrocervical trunk /-sur′vikəl/ [Gk, *thyreos,* shield, *eidos,* form; L, *cervix,* neck, *truncus*], one of a pair of short thick arterial branches arising from the first part of the subclavian arteries close to the medial border of the scalenus anterior and supplying numerous muscles and bones in the head, neck, and back. Each is divided into three branches: the inferior thyroid, the suprascapular, and the transverse cervical.

thyrocricotomy /-krīkot′əmē/ [Gk, *thyreos,* shield, *eidos,* form, *krikos,* ring, *temnein,* to cut], a tracheotomy procedure in which the cricovocal membrane is divided.

thyrogenic /-jen′ik/ [Gk, *thyreos,* shield, *eidos,* form, *genein,* to produce], pertaining to an origin in the thyroid gland. Also *thyrogenous* /thīroj′ənəs/.

thyroglobulin test, a blood test used primarily to detect well-differentiated thyroid cancers.

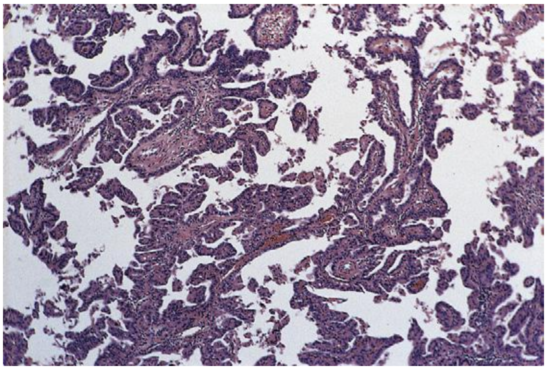
thyroglossal /-glos′əl/, pertaining to an embryonic duct connecting the thyroid gland and the tongue. Also **thyrolingual.**

thyrohyoid membrane, a tough fibroelastic ligament that spans between the superior margin of the thyroid cartilage below and hyoid bone above. It is attached to the superior margin of the thyroid laminae and adjacent anterior margins of the superior horns and ascends medial to the greater horns and posterior to the body of the hyoid bone to attach to the superior margins of these structures. An aperture in the lateral part of the membrane on each side allows the passage of the superior laryngeal arteries, nerves, and lymphatics.

thyroid. See **thyroid gland.**

thyroid acropathy /thī′roid/ [Gk, *thyreos,* shield, *eidos,* form, *akron,* extremity, *pathos,* disease], swelling of subcutaneous tissue of the extremities and clubbing of the digits, occurring rarely in patients with thyroid disease and usually associated with pretibial myxedema or exophthalmos.

thyroid cancer, a neoplasm of the thyroid gland, usually characterized by slow growth and a slower and more prolonged clinical course than that of other malignancies. A significant carcinogenic effect of exposure to ionizing radiation is demonstrated by the high rate of thyroid cancer in survivors of exposure to atomic bomb explosions and in individuals who have been treated with radiotherapy for an enlarged thymus in infancy or for acne or other skin disorders in adolescence. Nontoxic colloid goiters and follicular adenomas may be precursors of malignant thyroid tumors. The first sign of cancer may be an increased size of the thyroid gland, a painless palpable nodule, hoarseness, dysphagia, dyspnea, or pain on pressure. Diagnostic measures include x-ray examination, transillumination of the gland, radioisotope scanning, needle biopsy, and ultrasonic examination. More than half of thyroid malignancies are papillary carcinomas, about one third are follicular carcinomas, and the rest consist of rapidly growing invasive anaplastic carcinomas; medullary carcinomas that secrete calcitonin; and metastatic lesions from primary tumors in the breast, kidneys, or lungs. Total or subtotal thyroidectomy with excision of involved lymph nodes is usually recommended. Radioactive iodine may be administered after surgery, and high doses of exogenous thyroid are often used to suppress thyroid-stimulating hormone (TSH) in an effort to cause the regression of residual tumor dependent on TSH. Various chemotherapeutic agents, especially adriamycin, may be effective in patients with metastatic thyroid cancer that is unresponsive to conventional treatment. Thyroid cancer is twice as common in women as in men. Although it is diagnosed most frequently in people between 30 and 50 years of age, it may also occur in children and older individuals.



Thyroid cancer: papillary carcinoma
(Belchetz and Hammond, 2003)

thyroid cartilage, the largest cartilage of the larynx, consisting of two laminae fused together at an acute angle in the midline of the anterior neck to form the Adam's apple. Compare **cricoid.**

thyroid crisis [Gk, *thyreos,* shield, *eidos,* form, *krisis,* turning point], a sudden exacerbation of symptoms of thyrotoxicosis, characterized by fever, sweating, tachycardia, extreme nervous excitability, and pulmonary edema. It usually occurs in a patient whose thyrotoxicosis treatment is inadequate, and the paroxysm is triggered by a stressful infection or injury. If untreated, the crisis is often fatal. Also called **thyroid storm, thyrotoxic crisis.** See also **Graves' disease.**

thyroid dermoid cyst, a tumor derived from embryonal tissues that is believed to develop in the thyroid gland or in the thyrolingual duct.

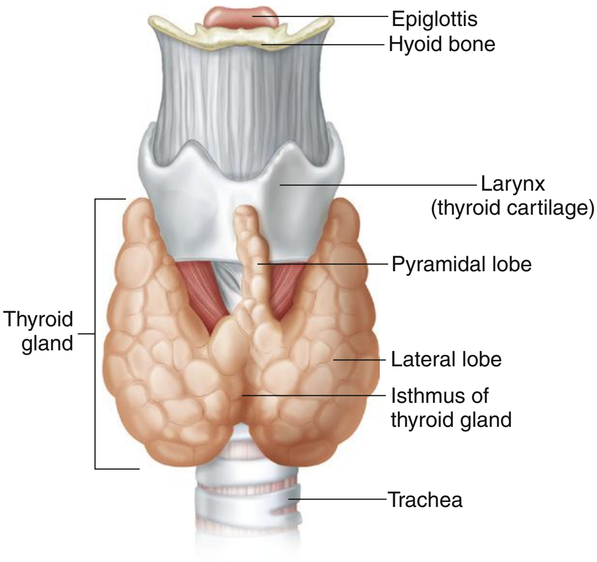
thyroid dermopathy, pretibial myxedema.

thyroidectomized /thī′roidek′təmīzd/ [Gk, *thyreos,* shield, *eidos,* form, *ektomē,* excision], pertaining to a patient or condition in which the thyroid gland has been removed.

thyroidectomy /thī′roidek′təmē/ [Gk, *thyreos* + *eidos,* form, *ektomē,* excision], the surgical removal of the thyroid gland. It is performed for colloid goiter, tumors, or hyperthyroidism that does not respond to iodine therapy and antithyroid drugs. All but 5% to 10% of the gland is removed. Regrowth usually begins shortly after surgery, and thyroid function may return to normal. For cancer of the thyroid, the entire gland is removed, followed by iodine-131 remnant ablation. Before surgery the basal metabolism rate is lowered to normal by giving iodine and antithyroid drugs. If a tumor is present, a frozen section of the affected tissue is examined by a pathologist. If malignant cells are found, all the gland is removed. After surgery the patient is most comfortable in semi-Fowler's position with continuous mist inhalation administered to liquefy oral secretions. Oral suctioning may be necessary. A tracheotomy set and oxygen are kept in the room. Calcium gluconate is on hand for use if the patient develops tetany. After surgery the patient is observed for signs of hemorrhage, respiratory difficulty caused by edema of the glottis, and the muscular twitching of tetany from inadvertent removal of a parathyroid gland.

thyroid function test, any of several laboratory tests performed to evaluate the function of the thyroid gland. Thyroid function tests include protein-bound iodine, butanol-extractable iodine, T_3, T_4, free thyroxine index, thyroxin-binding globulin, thyroid-stimulating hormone, long-acting thyroid stimulator, radioactive iodine uptake, and radioactive iodine excretion. Often several of the tests are performed simultaneously.

thyroid gland [Gk, *thyreos,* shield, *eidos,* form], a highly vascular organ at the front of the neck, usually weighing about 30 g, consisting of bilateral lobes connected in the middle by a narrow isthmus. It is slightly heavier in women than in men and enlarges during pregnancy. The majority of the thyroid gland secretes the hormones thyroxin and triiodothyronine, and other clusters of cells produce the hormone calcitonin. These hormones are secreted directly into the blood; thus the thyroid is part of the endocrine system of ductless glands. It is essential to normal body growth in infancy and childhood, and its removal greatly reduces the oxidative processes of the body, producing a lower metabolic rate characteristic of hypothyroidism. The thyroid gland is activated by the pituitary thyrotrophic hormone and requires iodine to elaborate thyroxine. Also called **thyroid.** Compare **parathyroid gland.**



Thyroid gland *(Patton and Thibodeau, 2010)*

thyroid hormone, an iodine-containing compound secreted by the thyroid gland, predominantly as thyroxine (T_4) and, in smaller amounts but four times more potent, triiodothyronine (T_3). These hormones increase the rate of metabolism; affect body temperature; regulate protein, fat, and carbohydrate catabolism in all cells; maintain growth hormone secretion, skeletal maturation, and the cardiac rate, force, and output; promote central nervous system development; stimulate the synthesis of many enzymes; and are necessary for muscle tone and vigor. Derivatives of thyronine, T_4 and T_3, are synthesized in the thyroid gland by a complex process involving the uptake, oxidation, and incorporation of iodide and the production of thyroglobulin, the form in which the hormones apparently are stored in thyroid follicular colloid. After the proteolysis of thyroglobulin, T_4 and T_3 are released and transported in the blood in strong, but noncovalent, association with certain plasma proteins; T_4 accounts for approximately 90% of iodine in circulation, and T_3 for 5%. All phases of the production and release of T_4 and T_3 are regulated by the thyroid-stimulating hormone secreted by the anterior pituitary gland. Production of thyroid hormones is excessive in Graves' disease and toxic nodular goiter (Plummer's disease), diminished in myxedema, and absent in cretinism. The normal 6- to 7-day half-life of T_4 in blood is reduced to 3 or 4 days in hyperthyroidism and extended to 9 or 10 days in myxedema. T_3 has a normal half-life of 2 days or less and, like T_4, is metabolized most actively in the liver. Pharmaceutic preparations of thyroid hormones extracted from animal glands and the synthetic compounds levothyroxine sodium and liothyronine sodium are used as replacement therapy in patients with hypothyroidism. The dosage is initially low and is gradually increased to the optimal level based on the patient's clinical response and tests of the findings on thyroid function studies. Overdosage or a rapid increase in the dosage may result in signs of hyperthyroidism, such as nervousness, tremor, tachycardia, cardiac arrhythmia, and menstrual irregularity.

-thyroidism. See **-thyrea.**

thyroiditis /thī′roidī′tis/, inflammation of the thyroid gland. Acute thyroiditis caused by staphylococcal, streptococcal, or other infections is characterized by suppuration and abscess formation and may progress to subacute diffuse disease of the gland. Subacute thyroiditis is marked by fever, weakness, sore throat, and a painfully enlarged gland containing granulomas composed of colloid masses surrounded by giant cells and mononuclear cells. Chronic lymphocytic thyroiditis (Hashimoto's disease), characterized by lymphocyte and plasma cell infiltration of the gland and diffuse enlargement, seems to be transmitted as a dominant trait, may be associated with various autoimmune disorders, and is more common in women. Another chronic form of autoimmune thyroiditis is Riedel's struma, a rare progressive fibrosis, usually of one lobe of the gland but sometimes involving both lobes, the trachea, and surrounding muscles, nerves, and blood vessels. Radiation thyroiditis occasionally occurs 7 to 10 days after the treatment of hyperthyroidism with radioactive iodine 131.

thyroid notch, **1.** (superior) a separation above the anterior border of the thyroid cartilage. **2.** (inferior) a depression in the middle of the lower border of the thyroid cartilage.

thyroido-. See **thyro-.**

thyroid-releasing hormone. See **thyrotropin-releasing hormone.**

thyroid scanning, a radionuclear scan that determines the size, shape, position, and physiological function of the thyroid gland. It is useful in patients with neck or substernal masses, thyroid nodules, hyperthyroidism, metastatic tumors without a known primary site, and well-differentiated forms of thyroid cancer. The scan may focus either on the neck area only, or on the whole body (done in patients previously treated for thyroid cancer).

thyroid-stimulating hormone (TSH), a substance secreted by the anterior lobe of the pituitary gland that controls the release of thyroid hormone and is necessary for the growth and function of the thyroid gland. The secretion of TSH is regulated by thyrotropin-releasing hormone, elaborated in the median eminence of the hypothalamus and circulating thyroid hormone levels. Normal adult blood levels are 2 to 10 mU/L (SI units). Also called **thyrotropin.** See also **thyroid hormone.**

thyroid-stimulating hormone test (TSH test), a thyroid function test in which thyrotropin (thyroid-stimulating hormone) is administered intramuscularly and the thyroid gland is monitored over time with scintiscanning or radioimmunoassays for a response or areas of decreased responsiveness. It is also used to monitor exogenous thyroid replacement. The test was formerly used for determining whether hypothyroidism was caused by thyroid gland failure or by deficiency in thyrotropin. Also called *thyroid-stimulating hormone assay.*

thyroid-stimulating immunoglobulins test, a blood test to diagnose Graves' disease.

thyroid storm, a crisis of uncontrolled thyrotoxicosis caused by the release into the bloodstream of increased amounts of thyroid hormone. Thyroid storm may occur spontaneously or be precipitated by infection, stress, or a thyroidectomy performed on a patient who is inadequately prepared with antithyroid drugs. Characteristic signs are fever that may reach 106° F, a rapid pulse, acute respiratory distress, apprehension, restlessness, irritability, and prostration. The patient may become delirious, lapse into a coma, and die of heart failure. Also called **thyroid crisis.**

thyroid ultrasound, an ultrasound examination of the thyroid gland, used to distinguish cystic from solid thyroid nodules, to determine the efficacy of treatment of a thyroid mass, and to study the thyroid gland of pregnant patients.

Thyrolar, a trademark for a thyroid hormone **(liotrix).**

thyroliberin /thī′rōlib′ərin/, a tripeptide hormone produced by the hypothalamus that stimulates the anterior pituitary gland to release thyrotropin. Also called **thyrotropin-releasing hormone.**

thyrolingual. See **thyroglossal.**

thyromegaly /-meg′əlē/ [Gk, *thyreos,* shield, *eidos,* form, *megas,* large], enlargement of the thyroid gland.

thyrotonine (T$_3$) triiodothyronine. See **thyroid hormone.**

thyrotoxic crisis. See **thyroid crisis.**

thyrotoxic myopathy /-tok′sik/, a condition in thyrotoxicosis consisting of severe weakness in the limb and trunk muscles, including those used in speech and swallowing.

thyrotoxicosis. See **Graves' disease.**

thyrotoxin /-tok′sin/, a theoretic cytotoxin of the thyroid gland, assumed to be a cause of the signs and symptoms of thyrotoxicosis.

thyrotrophic /-trof′ik/ [Gk, *thyreos,* shield, *eidos,* form, *trophe,* nutrition], influencing the thyroid gland, such as the thyroid-stimulating hormone. Also spelled **thyrotropic.**

thyrotropic hormone. See **thyroid-stimulating hormone.**

thyrotropin. See **thyroid-stimulating hormone.**

thyrotropin alfa, a recombinant form of human thyrotropin. It binds to thyrotropin receptors and stimulates the steps in thyroid hormone synthesis, including iodine uptake and synthesis and secretion of thyroglobulin. It is used as a diagnostic adjunct in serum thyroglobulin testing, with or without radioiodine scanning, in follow-up of patients with well-differentiated thyroid cancer and is administered intramuscularly.

thyrotropin alpha /-trō′pin/, a thyroid-stimulating hormone made with recombinant DNA technology, it increases the uptake of radioactive iodine in the thyroid and the secretion of thyroxine by the thyroid.

■ INDICATIONS: It is prescribed in diagnostic tests and to enhance uptake of ^{131}I in the treatment of thyroid cancer.

■ CONTRAINDICATIONS: Coronary thrombosis or known hypersensitivity to this drug prohibits its use. It should not be given in untreated Addison's disease or after myocardial infarction.

■ ADVERSE EFFECTS: Among the most serious adverse effects are symptoms of hyperthyroidism, allergic reactions, hypotension, and arrhythmias.

thyrotropin-releasing hormone (TRH), a substance produced in the hypothalamus that stimulates the release of thyrotropin (thyroid-stimulating hormone) from the anterior lobe of the pituitary gland. Formerly called *thyrotropin-releasing factor, TSH-releasing factor.*

thyrotropin-releasing hormone stimulation test, a thyroid function test that assesses release of thyrotropin by the pituitary gland. A bolus of thyrotropin-releasing hormone is administered, and serum concentrations of thyrotropin are assessed at intervals. If serum levels do not increase within 30 to 40 minutes, the pituitary thyrotrophs are dysfunctional. Also called *thyrotropin-releasing hormone test,* **TRH stimulation test.**

thyroxine (T$_4$) /thīrok′sēn/, a hormone of the thyroid gland, derived from tyrosine and deiodinated in the periphery to T$_3$ (triiodothyronine) that stimulates metabolic rate. Also called **tetraiodothyronine.**

thyroxine-binding globulin (TBG), a plasma protein that binds with and transports thyroxine in the blood.

thyroxine-binding globulin test, a blood test used to detect levels of TBG, the major thyroid hormone protein carrier. Elevated TBGs may indicate porphyria or infectious hepatitis, among other conditions, while decreased TBGs may signify various causes of hypoproteinemia (nephrotic syndrome, GI malabsorption, malnutrition).

Ti, symbol for the element **titanium.**

TI, **1.** time to inversion. **2.** the time interval between the initial 180-degree pulse and the subsequent 90-degree radiofrequency pulse in an inversion recovery pulse sequence. **3.** abbreviation for **therapeutic index.**

TIA, abbreviation for **transient ischemic attack.**

tiagabine, an anticonvulsant.

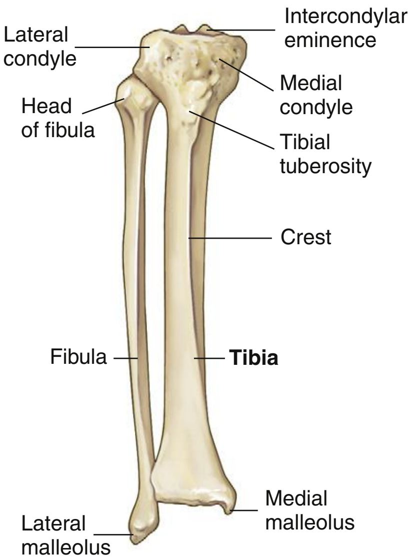
■ INDICATION: It is used as an adjunct treatment for partial seizures.

■ CONTRAINDICATION: Known hypersensitivity to this prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include dizziness, anxiety, somnolence, ataxia, amnesia, unsteady gait, depression, vasodilation, nausea, vomiting, diarrhea, pruritus, rash, pharyngitis, and coughing. Abrupt discontinuation of this drug can cause sudden onset of seizures. Simultaneous use of the herb ginkgo may decrease anticonvulsant effectiveness.

tibia /tib′ē·ə/ [L, shin bone], the second longest bone of the skeleton, located at the anteromedial side of the leg. It articulates with the fibula laterally, the talus distally, and the femur proximally, forming part of the knee joint. It provides insertion for the quadriceps femoris group of muscles via the patellar ligament and attaches to various muscles, including the popliteus and the flexor digitorum longus. Also called **shin bone.**

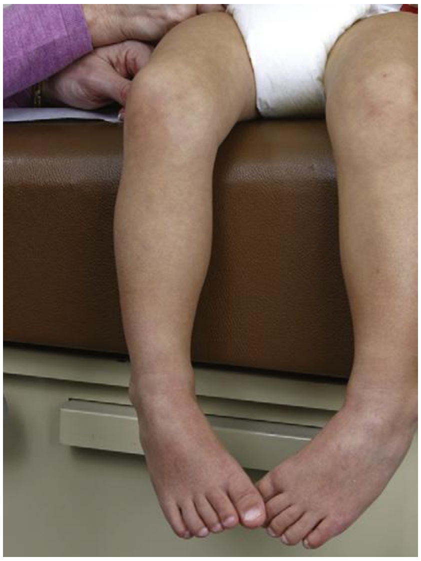
tibia-, prefix meaning "the tibia": *tibial, tibialis, tibiafemoral.*



Tibia *(Patton and Thibodeau, 2010)*

tibial /tib′ē·əl/ [L, *tibia,* shin bone], pertaining to the largest long bone of the lower leg.

tibial torsion [L, *tibia* + *torquere,* to twist], a lateral or a medial twisting rotation of the tibia on its longitudinal axis. It is similar to pronation of the hand, caused by the contraction of the pronator teres and the pronator quadratus, or supination of the hand caused by the contraction of the supinator muscle. Compare **femoral torsion.**



Internal tibial torsion
(Duderstadt, 2006)

tibialis anterior /tib′ē·ā′lis/ [L, *tibia* + *anticus,* in front], one of the anterior crural muscles of the leg, situated on the lateral side of the tibia. It is a thick fleshy muscle proximally and tendinous distally. The muscle dorsiflexes and inverts the foot. Also called *tibialis anticus*. Compare **extensor digitorum longus.**

tibial nerve, a major branch of the sciatic nerve that is associated with the posterior compartment of the leg. In the leg it gives rise to branches that supply all the muscles in the posterior compartment of the leg and two cutaneous branches. It enters the foot to supply most of the intrinsic muscles and skin.

tibia valga [L, *tibia,* shin bone, *valgus,* bowlegged], a bowed tibia with the convex surface toward the outside of the leg.

tic. See **mimic spasm.**

-tic, suffix meaning "pertaining to": *paralytic, therapeutic*.

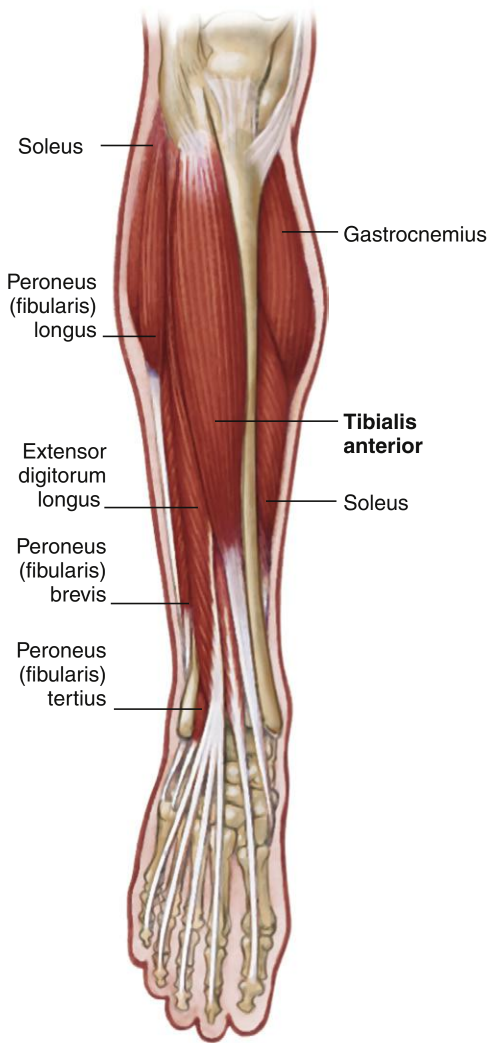
Ticar, a trademark for an antibiotic **(ticarcillin).**

ticarcillin /tik′ärsil′in/, an extended spectrum penicillin antibiotic.

■ INDICATIONS: It is prescribed in the treatment of bacterial septicemia, as well as skin, soft tissue, and respiratory infections caused by both gram-negative and gram-positive organisms, including some strains of *Pseudomonas*.

■ CONTRAINDICATION: A history of allergic reaction to any of the penicillins prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are anaphylactic reactions, thrombocytopenia, leukopenia, neutropenia, eosinophilia, vein irritation, and phlebitis.



Soleus
Gastrocnemius
Peroneus (fibularis) longus
Tibialis anterior
Extensor digitorum longus
Soleus
Peroneus (fibularis) brevis
Peroneus (fibularis) tertius

Tibialis anterior *(Patton and Thibodeau, 2010)*

tic douloureux /tikdo͞olo͞orœ′/ [Fr, painful spasm], a brief, extremely painful attack of trigeminal neuralgia. It is unilateral and limited to the distribution of the trigeminal (fifth cranial) nerve. An attack is easily and unexpectedly provoked by any stimulus of the facial muscles, from touching to speaking, and may occur repetitively. See also **trigeminal neuralgia.**

tick bite [ME, *tike* + AS, *bitan,* to bite], a puncture wound produced by the toothed beak of a blood-sucking tick, a small, tough-skinned arachnid. Ticks transmit several diseases to humans, and a few species carry a neurotoxin in their saliva that may cause ascending paralysis beginning in the legs. Nervousness, loss of appetite, tingling, and headache, followed by muscle pain and, in extreme cases, respiratory failure may occur. Symptoms often disappear when the attached tick is carefully removed with forceps. See also **Lyme disease, Q fever, relapsing fever, Rocky Mountain spotted fever, tularemia.**

tick-borne relapsing fever. See **Dutton's relapsing fever.**

tick-borne rickettsiosis [ME, *tike* + *beren* + *Rickettsia* + Gk, *osis,* condition], any disease transmitted by Ixodid ticks carrying the *Rickettsia* pathogens, microorganisms smaller than bacteria but larger than viruses. A common infectious species in North America is *Rickettsia rickettsii,* the cause of Rocky Mountain spotted fever.

tick fever, any of various infectious diseases transmitted by the bite of a tick. The causative parasite may be a *Rickettsia*, as in Rocky Mountain spotted fever; a bacterium, such as *Babesia* or *Borrelia;* or a virus, such as that causing Colorado tick fever.

tickling, a gentle stimulation of the skin surface that produces pleasurable reflexes.

tick paralysis, a rare, progressive, reversible disorder caused by several species of ticks that release a neurotoxin that causes weakness, incoordination, and paralysis. The tick must feed on the host for several days before the symptoms appear, and removal of the tick leads to rapid recovery. Because respiratory or bulbar paralysis can cause death, it is important to search for ticks, frequently hidden in scalp hair, on a patient with these symptoms. This infection is often confused with Guillain-Barré syndrome, botulism, and myasthenia gravis.

ticlopidine /tiklo′pidēn/, a platelet inhibitor used as the hydrochloride salt in the prevention of stroke syndrome.

t.i.d., (in prescriptions) abbreviation for the Latin phrase *ter in die* /dē′ā/, "three times a day."

tidal /tī′dəl/ [AS, *tid,* time], pertaining to an alternating process, such as a rise-and-fall, ebb-and-flow, or periodic lapse of time.

tidal drainage. See **drainage.**

Tidal Model of Health Recovery. See **Barker, Phil.**

tidal volume (TV, V_t) [AS, *tid,* time; L, *volumen,* paper roll], the amount of air inhaled and exhaled during normal ventilation. Inspiratory reserve volume, expiratory reserve volume, and tidal volume make up vital capacity. See also **pulmonary function test.**

tide [AS, *tid*], a variation, increase, or decrease, in the concentration of a particular component of body fluids, such as acid tide, fat tide. **—tidal,** *adj.*

tidemark, a transitional zone, appearing as a wavy line, that marks the junction between calcified and uncalcified cartilage.

Tietze's syndrome /tēt′sēz/ [Alexander Tietze, German surgeon, 1864–1927], **1.** a disorder characterized by nonsuppurative swellings of one or more costal cartilages that may accompany chronic respiratory infections. It causes pain that may radiate to the neck, shoulder, or arm, mimicking the pain of coronary artery disease. If the pain is severe, infiltration with procaine and hydrocortisone may provide relief. **2.** albinism, except for normal eye pigment, accompanied by deaf mutism and hypoplasia of the eyebrows.

TIG, abbreviation for **tetanus immune globulin.**

Tigan, a trademark for an antiemetic **(trimethobenzamide hydrochloride).**

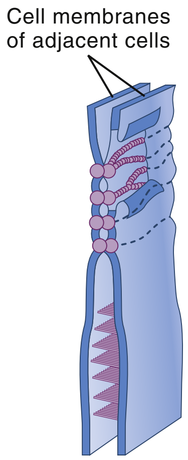
tigecycline, a broad-spectrum antiinfective.

■ INDICATIONS: This drug is used to treat complicated skin and skin structure infections caused by *Escherichia coli, Enterococcus faecalis* (vancomycin-susceptible only), *Staphylococcus aureus, Streptococcus agalactiae, S. anginosus group, S. pyogenes, Bacteroides fragilis* and complicated intraabdominal infections caused by *Citrobacter freundii, Enterobacter cloacae, Escherichia coli, Klebsiella oxytoca, K. pneumoniae, E. faecalis* (vancomycin-susceptible only), *S. aureus* (methicillin-susceptible only), *S. anginosus group, B. fragilis, B. thetaiotaomicron, B. uniformis, B. vulgatus, Clostridium perfringens,* and *Peptostreptococcus micros.*

■ CONTRAINDICATIONS: Pregnancy, lactation, and known hypersensitivity to this drug prohibit its use. Children under 18 years of age should not use this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache; dizziness; insomnia; hypertension; hypotension; phlebitis; anorexia; constipation; dyspepsia; pruritus; sweating; photosensitivity; increased aspartate aminotransferase, alanine aminotransferase, blood urea nitrogen, lactic acid, alkaline phosphatase, and amylase; hyperglycemia; hypokalemia; hypoproteinemia; bilirubinemia; back pain; fever; abnormal healing; abdominal pain; abscess; asthenia; infection; pain; peripheral edema; and local reactions. Life-threatening side effects include anemia, leukocytosis, and thrombocytopenia. Common side effects include nausea, vomiting, and diarrhea.

tight junction /tīt/ [ME, *thight,* strong; L, *jungere,* to join], the zonula occludens of the junctional complex between cells in which the plasma membranes of adjacent cells are in direct contact and where there is no intercellular space.



Tight junction *(Thibodeau and Patton, 2007)*

tilt table [AS, *tealt,* unsteady; L, *tabula,* board], an examining table that allows a patient to be raised to an approximate 60-degree angle during study of the response of the patient's circulatory system to gravitational forces. A tilt table is also used to assist recovery from orthostatic hypotension after prolonged immobility.

tiludronate, a parathyroid agent (calcium regulator).

■ INDICATION: It is used to treat Paget's disease.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to biphosphonates, pathological fractures, colitis, and severe renal disease with creatinine 5 mg/dL. Its use is also contraindicated in children.

■ ADVERSE EFFECTS: Adverse effects include dry mouth, gastritis, vomiting, flatulence, gastric ulcers, rhinitis, rales, sinusitis, upper respiratory infection, headache, somnolence, dizziness, anxiety, vertigo, nervousness, involuntary movements, hyperparathyroidism, rash, epidermal necrosis, pruritus, sweating, nephrotoxicity, decreased mineralization of nonaffected bones, and pathological fractures. Common side effects include nausea, diarrhea, and bone pain.

timbre /tim′bər/ [Fr], **1.** a characteristic sound quality of a voice or musical instrument, as determined by the harmonics of the sound. **2.** a second metallic sound heard in aortic dilation.

time (t) [AS, *tima*], **1.** a measure of duration. **2.** an interval separating two points in a continuum between the past and future.

time agnosia. See **dischronation.**

time constant, a mathematic term of fixed value used in expressing the rate of change of some variable, such as airflow in the airways, as a function of time.

timed collection, the collection of a specimen, such as a urine or stool sample, for a specific period of time.

timed cycling, the delivery of gas under positive pressure during inspiration until an adjustable, preselected time interval has elapsed.

time delay, a period between the application of an input and the beginning of the response.

timed release. See **prolonged release.**

timed vital capacity. See **forced expiratory vital capacity.**

time gain compensation (TGC), increasing amplification of echoes from increasing tissue depths. It is used in ultrasound to correct for increased attenuation of sound with tissue depth.

time-sharing. See **multitasking.**

time trigger, a trigger for initiating assisted ventilation, consisting of a mechanism that measures frequency of respirations and starts assisted ventilation when the respiratory frequency is at a given point.

timolol maleate /tim′əlōl/, a beta-adrenergic receptor blocking agent.

■ INDICATIONS: An ophthalmic preparation is used for treating glaucoma, especially chronic open-angle glaucoma. It is administered orally for the treatment of angina and hypertension, to reduce postmyocardial infarction mortality, and as migraine prophylaxis.

■ CONTRAINDICATIONS: Bronchial asthma, chronic obstructive pulmonary disease, sinus bradycardia, cardiogenic shock, pregnancy (second or third trimester), or known hypersensitivity to this drug prohibits its use. It is used with caution in patients (e.g., diabetics) with contraindications to systemic use of beta-adrenergic receptor blocking agents.

■ ADVERSE EFFECTS: The most serious adverse effects of ophthalmic use is blurring of vision. Mild eye irritation also may occur. When it is used systemically, adverse reactions include bronchospasm, cold extremities, decreased sexual ability, drowsiness, and insomnia.

Timoptic, a trademark for a beta-adrenergic receptor blocking agent **(timolol maleate).**

tin (Sn) [AS], a whitish metallic element. Its atomic number is 50; its atomic mass is 118.69. Tin (IV) oxide is used in dentistry as a polishing agent for teeth and in some restorative procedures. See also **stannous fluoride.**

Tinactin, a trademark for an antifungal **(tolnaftate).**

tincture, a plant extract made by soaking herbs in a liquid (such as water, alcohol, vinegar, or glycerine) for a specified length of time, then straining and discarding the plant material. The remaining liquid is used therapeutically. Tinctures typically are made at a concentration of 1:5 to 1:10.

tincture (tinct.) /tingk′chər/, a substance in a solution that is dissolved in alcohol.

tincture of iodine [L, *tinctura* + Gk, *ioeides,* violet], a mixture of sodium iodide in an alcohol-water solution used as a skin disinfectant. The term is no longer in official use.

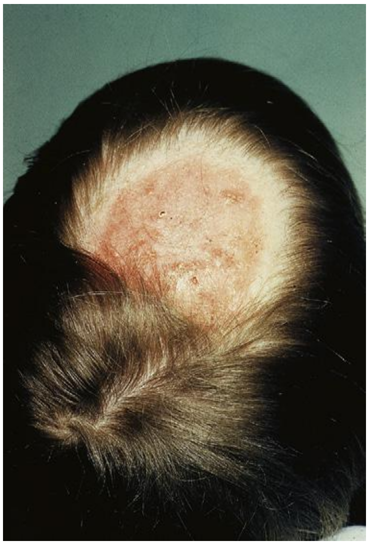
Tindamax, a trademark for **tinidazole.**

T-independent antigen, an antigen that can trigger B lymphocytes to produce antibodies without the participation of T lymphocytes.

tine, a sharp projecting point, as a prong of a fork.

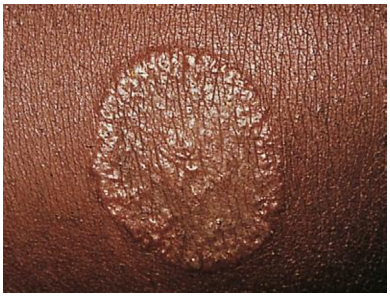
tinea /tin′ē·ə/ [L, worm], a group of fungal skin diseases caused by dermatophytes of several kinds. The condition is characterized by itching, scaling, and sometimes painful lesions. Tinea is spread by direct contact between humans and even domestic dogs or cats. Diagnosis is made by demonstrating fungus on smear or by culture. Also called **ringworm.** See also **tinea corporis, tinea cruris, tinea pedis, tinea unguium.**

tinea capitis, a superficial fungal infection of the scalp, most common in children. Most infections are caused by species of *Trichophyton*. The infection may lead to hair loss and become secondarily infected with bacteria, causing a severe inflammation. Symptoms include severe itching and scaling of the scalp. Treatment with oral antifungal agents as well as appropriate antibiotics is necessary. Oral steroids may be necessary to prevent scarring hair loss.



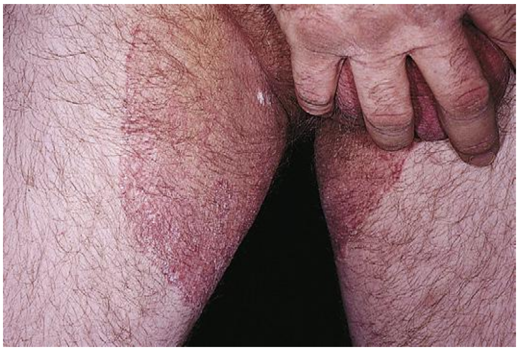
Tinea capitis *(Conlon and Snydman, 2000)*

tinea corporis, a superficial fungal infection of the nonhairy skin of the body, most prevalent in hot, humid climates and usually caused by species of *Trichophyton* or *Microsporum*. Topical fungicides such as miconazole are used for moderate cases; severe infection calls for griseofulvin.



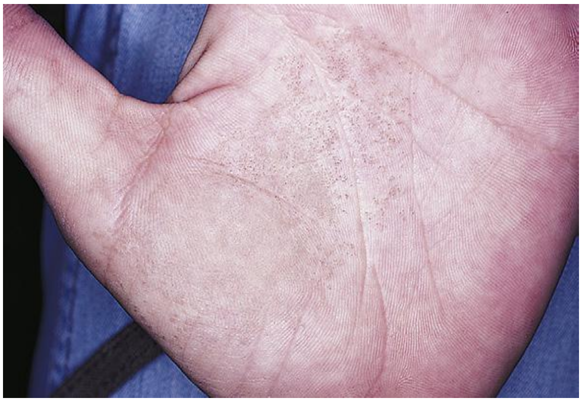
Tinea corporis *(Zitelli and Davis, 2007)*

tinea cruris /kro͞o′ris/, a superficial fungal infection of the groin caused by species of *Trichophyton* or *Epidermophyton floccosum*, the second most common dermatophytosis for clinical presentation. It is most common in the tropics and among males. Topical antifungals such as miconazole and clotrimazole are often prescribed. Griseofulvin is used only for severe resistant cases. Also called **jock itch.**



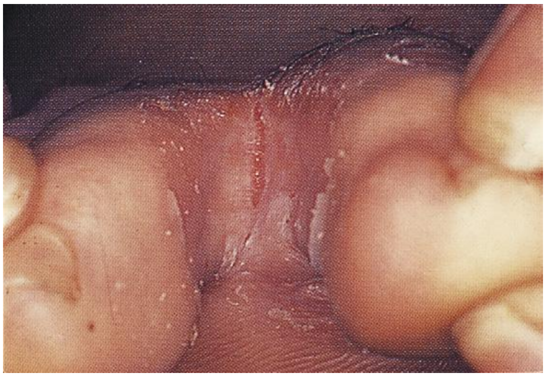
Tinea cruris *(Callen et al, 2000)*

tinea nigra, an uncommon superficial fungal infection caused by *Malassezia furfur* or *werneckii,* formerly classified as *Exophiala werneckii,* characterized by dark lesions on the skin of the hands or occasionally other areas. Also called **pityriasis nigra.**



Tinea nigra *(Callen et al, 2000/Courtesy Dr. Joseph Chanda)*

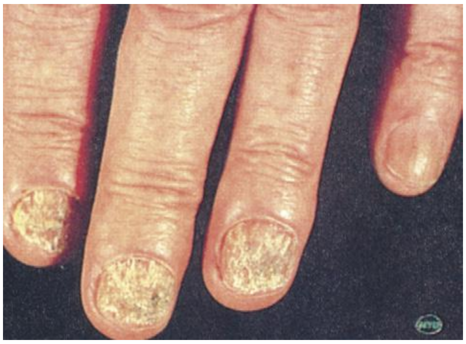
tinea pedis, a chronic superficial fungal infection of the foot, especially of the skin between the toes and on the soles. It is common worldwide and is most commonly caused by *Trichophyton rubrum, T. mentagrophytes,* and *Epidermophyton floccosum*. Adults are most susceptible. The wearing of constricting footwear such as sneakers seems to induce the infection. Drying the feet well after bathing and applying powder between the toes help prevent it. Griseofulvin is the most effective treatment, but miconazole and tolnaftate are also used. Recurrence is common. Also called **athlete's foot.**



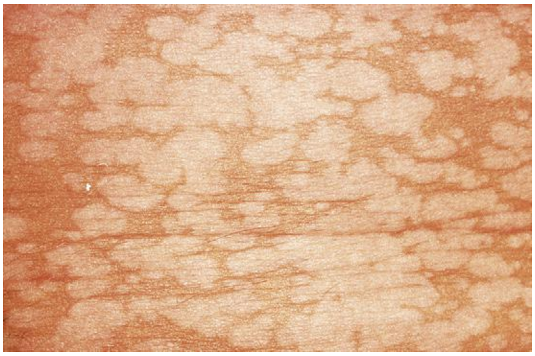
Tinea pedis *(Belchetz and Hammond, 2003)*

tinea unguium /un′gwē·əm/, a superficial fungal infection of the nails caused by various species of *Trichophyton* and occasionally by *Candida albicans*. It is more common on the toes than the fingers and can cause complete crumbling and destruction of the nails. Itraconazole and terbinafine are the drugs of choice, but they must be continued until the nail has regrown completely. See also **onychomycosis.**

tinea versicolor, a fungal infection of the skin caused by *Malassezia furfur* and characterized by finely desquamating, pale tan patches on the upper trunk and upper arms that may itch and do not tan. In dark-skinned people the lesions may be depigmented. The fungus fluoresces under Wood's light and may be easily identified in scrapings viewed under a microscope. Topical and oral antifungal agents may be used, as well as repeated applications of selenium sulfide. The pale patches may persist for up to 1 year after successful treatment, and recurrence is common.

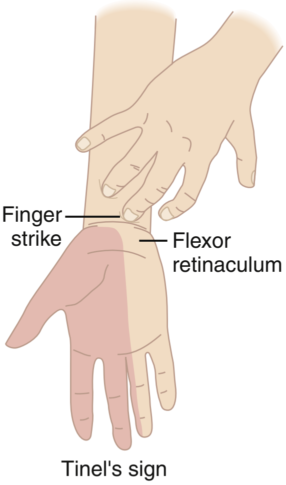


Tinea unguium
(Courtesy American Academy of Dermatology and Institute for Dermatologic Communication and Education)



Tinea versicolor *(Goldman et al, 2008)*

Tinel's sign /tinelz′/ [Jules Tinel, French neurosurgeon, 1879–1952], an indication of irritability of a nerve; a distal tingling sensation on percussion of a damaged nerve. The sign is often present in carpal tunnel syndrome and is produced by tapping over the median nerve on the volar aspect of the wrist.



Evaluation of Tinel's sign *(Black and Hawks, 2009)*

tine test /tīn/ [ME, *tind,* rake tooth; L, *testum,* crucible], a tuberculin skin test in which a small disposable disk with multiple tines bearing tuberculin antigen is used to puncture the skin. The method is widely used to test for sensitivity to the tuberculin antigen. Induration around the puncture site indicates previous exposure or active disease, requiring further testing. See also **tuberculin test.**

tingling [ME, *tinklen,* to tinkle], a prickly sensation in the skin or a body part, accompanied by diminished sensitivity to stimulation of the sensory nerves.

tinidazole, an antiprotozoal.

■ INDICATIONS: This drug is used to treat amebiasis, giardiasis, and trichomoniasis.

■ CONTRAINDICATIONS: First-trimester pregnancy and known hypersensitivity to nitroimidazole derivative or to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include anorexia, increased aspartate aminotransferase and alanine aminotransferase, constipation, abdominal pain, neutropenia, pruritus, urticaria, and oral monilia. Life-threatening side effects include seizures, leukopenia, and angioedema. Common side effects include dizziness, headache, peripheral neuropathy, nausea, vomiting, and rash.

tinnitus /tinī′təs/ [L, *tinnire,* to tinkle], a subjective noise sensation, often described as ringing, heard in one or both ears. It may be a sign of acoustic trauma, aspirin toxicity, multiple sclerosis, Ménière's disease, otosclerosis, presbycusis, or an accumulation of cerumen impinging on the eardrum or occluding the external auditory canal. It occasionally occurs for no apparent reason.

tint, a shade or gradation of a color, usually a pale or less saturated version of the basic shade.

tinted denture base, a denture base that has a color close to that of natural oral tissue.

TINU syndrome, a rare syndrome of tubulointerstitial nephritis and uveitis, often with immunological alterations. Also called *Dobrin syndrome*.

tinzaparin /tin-zap′ah-rin/, a low-molecular-weight heparin obtained by depolymerization of heparin from porcine intestinal mucosa by using a bacterial enzyme. It acts as an anticoagulant and antithrombotic and is used as an adjunct to warfarin in the treatment of deep venous thrombosis with or without pulmonary embolism and is administered subcutaneously.

-tion, suffix meaning "act of, process of, result of": *elongation, irritation*.

tiotropium, an anticholinergic and bronchodilator.

■ INDICATIONS: This drug is used for long-term treatment of chronic obstructive pulmonary disease (COPD) and for once-daily maintenance of bronchospasm associated with COPD, including chronic bronchitis and emphysema.

■ ADVERSE EFFECTS: Adverse effects of this drug include depression, chest pain, increased heart rate, dry mouth, blurred vision, glaucoma, abdominal pain, constipation, dyspepsia, rash, urinary difficulty, urinary retention, sinusitis, upper respiratory tract infection, epistaxis, and pharyngitis. Common side effects include vomiting, cough, and a worsening of symptoms.

tip, **1.** the end of a pointed object. **2.** an attachment fitted to the end of something else. **3.** a point.

tipped uterus /tipt/ [ME, *tipen,* upset; L, *uterus,* womb], a uterus that is displaced from its normal position. See also **uterine anteflexion, uterine anteversion, uterine retroflexion, uterine retroversion.**

tip pinch, a grasp in which the tip of the thumb is pressed against any or each of the tips of the other fingers. Also called **pinch grip.** See also **palmar pinch, pinch.**

tipping, a tooth movement in which the angle of the tooth's long axis is changed.

tipranavir, an antiretroviral.

■ INDICATIONS: This drug is used in combination with other antiretrovirals to treat HIV.

■ CONTRAINDICATIONS: Hepatic disease (Child-Pugh B to C) and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, somnolence, fatigue, anorexia, dry mouth, nephrolithiasis, rash, pain, asthenia, and hyperlipidemia. Life-threatening side effects include hepatitis B or C, fatalities when given with ritonavir, insulin-resistant hyperglycemia, and ketoacidosis. Common side effects include headache, insomnia, diarrhea, abdominal pain, nausea, and vomiting.

TIPS, abbreviation for **transjugular intrahepatic portosystemic shunt.**

tip seal, the closure of an ampule accomplished by melting a bead of glass at the neck of the ampule.

tirofiban, an antiplatelet agent.

■ INDICATION: It is used to treat acute coronary syndrome.

■ CONTRAINDICATIONS: The following factors prohibit its use: known hypersensitivity to this drug, active internal bleeding, stroke, major surgery, severe trauma, intracranial neoplasm, aneurysm, and hemorrhage.

■ ADVERSE EFFECTS: Bleeding is a life-threatening effect of tirofiban. Other adverse reactions include bradycardia, dizziness, dissection, coronary artery edema, pain in the legs and/or pelvis, and sweating. Rash is a common side effect.

tisane /tizän′, tizän′/, a tealike infusion or light drink of a vegetable herb consumed for a claimed medicinal effect.

tissue /tish′o͞o/ [Fr, *tissu,* fabric], a collection of similar cells in a matrix acting together to perform a particular function.

tissue activator. See **plasminogen activator.**

tissue bank, a facility for storing and maintaining a collection of tissues for future use in transplants.

tissue-base relationship, the relationship of the bottom of a removable dental prosthesis to underlying structures.

tissue committee, a group that evaluates all surgery performed in a hospital or other health care facility. The evaluation is usually made on the basis of the extent of agreement of the preoperative, postoperative, and pathological diagnoses and on the relevance and acceptability of the diagnostic procedures. See also **tissue review.**

tissue culture [OFr, *tissu* + L, *colere,* to cultivate], the maintenance of growth in vitro, under artificial conditions, of tissue or organ specimens.

tissue dextrin. See **glycogen.**

tissue dose, the amount of radiation absorbed by tissue in the region of interest, expressed in rad.

tissue factor, a protein necessary for the initiation of thrombin formation.

tissue fixation, a process in which a tissue specimen is placed in a fluid that preserves the cells as nearly as is possible in their natural state.

tissue fixative, a fluid that preserves cells in their natural state so that they may be identified and examined.

tissue forceps. See **thumb forceps.**

tissue integrity: skin and mucous membranes, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as structural intactness and normal physiological function of skin and mucous membranes. See also **Nursing Outcomes Classification.**

tissue kinase. See **fibrinokinase.**

tissue macrophage [OFr, *tissu* + Gk, *makros,* large, *phagein,* to eat], a large, mobile, highly phagocytic cell derived from monocytes. These cells become mobile when stimulated by inflammation and migrate to the affected area. They are resident in specific tissues (for example, alveolar macrophages in the lungs).

tissue perfusion: abdominal organs, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through the small vessels of the abdominal viscera to maintain organ function. See also **Nursing Outcomes Classification.**

tissue perfusion: cardiac, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through the coronary vasculature to maintain heart function. See also **Nursing Outcomes Classification.**

tissue perfusion: cellular, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through the vasculature to maintain function at the cellular level. See also **Nursing Outcomes Classification.**

tissue perfusion: cerebral, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through the cerebral vasculature to maintain brain function. See also **Nursing Outcomes Classification.**

tissue perfusion: peripheral, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through the small vessels of the extremities to maintain tissue function. See also **Nursing Outcomes Classification.**

tissue perfusion: pulmonary, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as adequacy of blood flow through pulmonary vasculature to perfuse alveoli/capillary units. See also **Nursing Outcomes Classification.**

tissue plasminogen activator (TPA), a clot-dissolving substance produced naturally by cells in the walls of blood vessels. It is also manufactured synthetically by genetic engineering techniques. TPA activates plasminogen to dissolve clots and has been used therapeutically to open occluded coronary arteries, as well as cerebral arteries.

tissue response, any reaction or change in living cellular tissue when it is acted on by disease, toxin, or other external stimulus. Some kinds of tissue responses are **immune response, inflammation,** and **necrosis.**

tissue review, a review of the surgery performed in a hospital or other health care facility. The evaluation is usually made on the basis of the extent of agreement of the preoperative, postoperative, and pathological diagnoses and on the relevance and acceptability of the diagnostic procedures. See also **tissue committee.**

tissue typing, a systematized series of tests to evaluate the intraspecies compatibility of tissues from a donor and a recipient before transplantation. Typing is accomplished by identifying and comparing a large series of **human leukocyte antigens** in the cells of the body. See also **immune system, transplant.**

titanium (Ti) /tītā′nē·əm/ [Gk, *Titan,* mythic giant], a chemical element. Its atomic number is 22; its atomic mass is 47.88. An alloy of titanium is used in the manufacture of orthopedic prostheses and dental implants. Titanium dioxide is the active ingredient in a number of topical ointments and lotions. Titanium dioxide is one of the whitest substances known and is used as a base pigment in many sunscreens.

titer /tī′tər/ [Fr, *titre,* to make a standard], **1.** the normality of a solution or substance, determined by titration to find the equivalence of two reactants. **2.** the extent to which an antibody can be diluted before losing its power to react with a specific antigen. **3.** the highest dilution of a serum that causes clumping of bacteria or other visible reaction. Also spelled **titre.**

titillation /tit′ilā′shən/ [L, *titillare,* to tickle], **1.** tickling. **2.** arousal of the senses.

Title [L, *titulus,* title], a section of the Social Security Act that provides for the establishment, funding, and regulation of a service to a specific segment of the population. Examples include Title XIX, which includes medical coverage under Medicaid, and Title X, which awards lump-sum grants for family planning programs.

titration /tītrā′shən/, a method of estimating the amount of solute in a solution. The solution is added in small, measured quantities to a known volume of a standard solution until a reaction occurs, as indicated by a change in color or pH or the liberation of a chemical product.

titre. See **titer.**

titubation /tich′əbā′shən/ [L, *titubare,* to stagger], unsteady posture characterized by a staggering or stumbling gait and a swaying head or trunk while sitting. It may be a manifestation of cerebellar disease. Compare **ataxia.**

TIVA, abbreviation for **total intravenous anesthesia.**

tizanidine, a skeletal muscle relaxant and a_2-adrenergic agonist.

■ INDICATIONS: It is used in the acute/intermittent management of increased muscle tone associated with spasticity.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include dry mouth, vomiting, increased ALT, abnormal liver function studies, constipation, somnolence, dizziness, speech disorder, dyskinesia, nervousness, hallucination, psychosis, urinary tract infection, blurred vision, urinary frequency, flulike syndrome, pharyngitis, and rhinitis.

TJC, abbreviation for **The Joint Commission.**

Tl, symbol for the element **thallium.**

TLC, **1.** abbreviation for **total lung capacity.** **2.** abbreviation for **thin-layer chromatography.** **3.** *(informal)* abbreviation for *tender loving care*.

TLI, abbreviation for **total lymphoid irradiation.**

TLR, abbreviation for **tonic labyrinthine reflex.**

TLSO, abbreviation for **thoracolumbosacral orthosis.**

T lymphocyte. See **lymphocyte, T cell.**

Tm, symbol for the element **thulium.**

TM, abbreviation for **transcendental meditation.**

TMJ, abbreviation for **temporomandibular joint.**

TMJ disorder. See **temporomandibular joint disorder.**

TMP/SMX, abbreviation for *trimethoprim sulfamethoxazole*. See **sulfamethoxazole,** and **trimethoprim.**

TNF, abbreviation for **tumor necrosis factor.**

TNM, a system for staging malignant neoplastic disease. See also **cancer staging.**

t.n.t.c., abbreviation for *too numerous to count,* usually applied to organisms or cells viewed on a slide under a microscope.

toadstool, popular name for any of various poisonous mushrooms.

toadstool poisoning /tōd′sto͞ol/ [AS, *tadige* + *stol* + L, *potio,* drink], a toxic condition caused by ingestion of certain varieties of poisonous mushrooms. See also **mushroom poisoning.**

to-and-fro murmur, a friction sound or murmur heard with both systole and diastole.

tobacco /təbak′ō/ [Sp, *tabaco*], a plant whose leaves are dried and used for smoking and chewing, and in snuff. See also **nicotine.**

tobacco withdrawal syndrome, a change in mood or performance associated with the cessation of or reduction in exposure to nicotine. Symptoms may range from lack of concentration to anxiety and temper outbursts. A multitude of physical symptoms can also emerge.

TOBEC, abbreviation for **total body electric conductivity.**

tobramycin sulfate /tō′brəmī′sin/, an aminoglycoside antibiotic.

■ INDICATIONS: It is prescribed in the treatment of external ocular infection, septicemia, and lower respiratory tract and central nervous system infections caused by gram-negative bacilli, including *Pseudomonas*.

■ CONTRAINDICATIONS: Kidney dysfunction, use of potent diuretics, or known hypersensitivity to this or other aminoglycosides prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse reactions are ototoxicity and nephrotoxicity.

Tobruk plaster /tō′bro͝ok/, a plaster cast splint with tapes for skin traction coming through openings in the plaster and connected with a Thomas' splint. It covers and immobilizes the leg from foot to groin. Also called *Tobruk splint*.

tocainide /to-ka′nīd/, an agent used as the hydrochloride salt in treatment of ventricular arrhythmias.

tocainide hydrochloride /tōkā′nīd/, an oral lidocaine-type antiarrhythmic.

■ INDICATIONS: It is prescribed for the suppression of symptomatic ventricular arrhythmias and has unlabeled use for treating trigeminal neuralgia.

■ CONTRAINDICATIONS: It may cause adverse cardiovascular effects, such as worsened arrhythmias and hypotension. It should not be given to patients with second- or third-degree atrioventricular block who do not also have an artificial ventricular pacemaker. It should not be administered to a patient with an uncorrected potassium deficit, and it may interact with beta-blockers, particularly in patients with known heart failure.

■ ADVERSE EFFECTS: Among the most serious adverse effects are hypotension, arrhythmias, dizziness, paresthesias, numbness, tremor, nausea, vomiting, rash, and headache.

-tocia, **1.** suffix meaning "conditions of labor": *mogitocia, omotocia, tomotocia*. **2.** combining form meaning the "product of parturition": *deuterotocia, dystrophiadystocia, odontocia*.

-tocin, suffix for oxytocin derivatives.

toco-, toko- /tō′kō-/, prefix meaning "childbirth or labor": *tocodynamometer, tocography, tocomania*.

tocodynamometer /tō′kōdī′nəmom′ətər/ [Gk, *tokos*, birth, *dynamis*, force, *metron*, measure], an electronic device for monitoring and recording uterine contractions in labor. It consists of a pressure transducer that is applied to the fundus of the uterus by means of a belt, which is connected to a machine that records the duration of the contractions and the interval between them on graph paper. The relative intensity of the contractions is also indicated but cannot be quantified. The tocodynamometer is a component of external monitoring in childbirth. Also spelled **tokodynamometer.** See also **electronic fetal monitor.**

tocolytic drug /-lit′ik/, any drug used to suppress premature labor.

tocopherol. See **vitamin E.**

tocopherolquinone (TQ) /tōkof′ərōlkwī′nōn/, an oxidized form of tocopherol, or vitamin E.

tocotransducer /-transd(y)o͞o′sər/ [Gk, *tokos* + L, *trans*, through, *ducer*, to lead], an electronic device used to measure uterine contractions. See also **tocodynamometer.**

toddler [ME, *toteren*, to walk unsteadily], a child between 12 and 36 months of age. During this period of development the child acquires a sense of autonomy and independence through the mastery of various specialized tasks such as control of body functions, refinement of motor and language skills, and acquisition of socially acceptable behavior, especially toleration of delayed gratification and acceptance of separation from the mother or parents. The period is characterized by exploration of the environment and rapid cognitive development as the child strives for self-assertion and personal interaction with others while struggling with parental discipline and sibling rivalry. Of primary importance for the nurse is an understanding of the dynamics of the growth and development of the toddler to help parents deal effectively with appropriate nutrition, toilet training, temper tantrums, prevention of accidental injury (primarily from falls, poisoning, and burns), and childhood fears, especially anxiety as a result of separation from the parents.

toddlerhood /tod′lərho͝od′/, the state or condition of being a toddler.

Todd's paralysis [Robert Bentley Todd, English physician, 1809–1860; Gk, *paralyein*, to be palsied], weakness, usually on one side of the body, after a seizure, usually lasting a few minutes, hours, or, occasionally, several days.

toe, any one of the digits of the feet.

toe clonus [AS, *tá* + Gk, *klonos*], an increased reflex activity in the large toe caused by a sudden extension of the first phalanx.

toe drop [AS, *tá* + *dropa*], a condition in which the toes droop and cannot be lifted because of paralysis of the tibial muscles.

toeing in. See **metatarsus varus.**

toeing out. See **metatarsus valgus.**

toenail [AS, *ta* + *naegel*], one of the heavy ungual structures covering the terminal phalanges of the toes. Also called **unguis** /ung′gwis/.

Tofranil, a trademark for a tricyclic antidepressant **(imipramine hydrochloride).**

Toga virus. See **hepatitis F.**

toilet training, the process of teaching a child to control the functions of the bladder and bowel. Training programs vary, but all emphasize a positive, consistent, nonpunitive, nonpressured approach. Each program is individualized, depending on the mental and physical age and state of the child, the parent-child relationship, and readiness of the child to learn. Training often begins around 24 months of age, when voluntary control of the anal and urethral sphincters is achieved by most children. When the child has mastered some motor skills, is aware of his or her ability to control the body, and can communicate adequately, training is likely to be easy. Resistance occurs if the parents try to train the child before the child is physiologically and psychologically ready. Bowel training is usually accomplished before bladder training because the urge to evacuate the bowel is stronger than the urge to empty the bladder, and the need is less frequent and more regular. Nighttime bladder control may not be achieved until the child is 4 or 5 years of age or older. Behavior modification, using a system of rewards for each of the various phases of the training, has been successful with both normal and mentally retarded children. A major nursing function is to identify the readiness of the child to learn and to work with the parents, advising them in a nonauthoritarian way of the various techniques.

-toin, suffix for hydantoin derivative antiepileptics.

token economy [AS, *tacen*, to show; Gk, *oikonomia*, household management], a technique of reinforcement used in behavior therapy in the management of a group of people, such as in hospitals, institutions, or classrooms. Individuals are rewarded for specific activities or behavior with tokens that they can exchange for desired objects or privileges.

toko-. See **toco-.**

tokodynamometer. See **tocodynamometer.**

TOLAZamide /tolaz′əmīd/, an oral sulfonylurea antidiabetic agent.

■ INDICATIONS: It is prescribed in the treatment of stable or type 2 diabetes and for some patients sensitive to other types of sulfonylureas or who have failed to respond to other similar drugs.

■ CONTRAINDICATIONS: Unstable diabetes, serious impairment of renal, hepatic, or thyroid function, pregnancy, or known hypersensitivity to this drug or other sulfonylurea medications prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypoglycemia and skin reactions. Blood dyscrasias may occur.

tolazoline hydrochloride /tolaz′əlēn/, an alpha-adrenergic receptor blocker.

■ INDICATIONS: It is prescribed in the treatment of persistent pulmonary hypertension of the newborn and in peripheral vascular disease.

■ CONTRAINDICATION: Hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are cardiac arrhythmia, hypotension or hypertension, exacerbation of stress ulcer, hemorrhage, and mitral stenosis.

TOLBUTamide /tolbo͞o′təmīd/, an oral sulfonylurea antidiabetic.

■ INDICATIONS: It is prescribed in the treatment of stable type 2 diabetes uncontrolled by diet alone and for some patients changing from insulin to oral therapy.

■ CONTRAINDICATIONS: Unstable diabetes, serious impairment of renal, hepatic, or thyroid function, pregnancy, or known hypersensitivity to this drug or to other sulfonylurea medications prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypoglycemia and skin reactions. Blood dyscrasias may occur.

tolcapone, an antiparkinsonian agent.

■ INDICATION: It is used in the treatment of parkinsonism.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Life-threatening effects include hemolytic anemia, leukopenia, and agranulocytosis. Other adverse reactions include dystonia, dyskinesia, dreaming, psychosis, hallucinations, dizziness, chest pain, hypotension, cataract, eye inflammation, diarrhea, constipation, urinary tract infection, urine discoloration, uterine tumor, micturition disorder, sweating, and alopecia. Common side effects include fatigue, headache, confusion, orthostatic hypotension, nausea, vomiting, anorexia, and abdominal distress.

Tolectin, a trademark for a nonsteroidal antiinflammatory agent **(tolmetin sodium).**

tolerance /tol′ərəns/ [L, *tolerare,* to endure], a phenomenon by which the body becomes increasingly resistant to a drug or other substance through continued exposure to the substance. A kind of tolerance is **work tolerance.**

tolerance dose. See **effective dose equivalent limit.**

tolerance test, **1.** an investigation of the ability of the body to metabolize a drug or nutrient, as in a glucose tolerance test. **2.** a physical activity drill administered to evaluate the efficiency of blood circulation or of another body system.

Tolinase, a trademark for an antidiabetic agent (TOLAZamide).

tolmetin sodium /tol′mətin/, a nonsteroidal antiinflammatory agent.

■ INDICATIONS: It is prescribed primarily in the treatment of rheumatoid arthritis, juvenile rheumatoid arthritis, and osteoarthritis.

■ CONTRAINDICATIONS: Impaired renal function, GI disease, or known hypersensitivity to this drug, to aspirin, or to nonsteroidal antiinflammatory medications prohibits its use. Should not be used during second and third trimesters of pregnancy.

■ ADVERSE EFFECTS: Among the more serious adverse effects are peptic ulcer and GI distress. Dizziness, skin rash, and tinnitus commonly occur. This drug interacts with many other drugs.

tolnaftate /tolnaf′tāt/, an antifungal.

■ INDICATIONS: It is prescribed in the treatment of superficial fungus infections of the skin, including tinea pedis, tinea cruris, tinea corporis, and tinea versicolor.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is also not indicated for nail or scalp infections.

■ ADVERSE EFFECTS: Among the more common adverse effects are hypersensitivity reactions and mild irritation of the skin.

Tolosa-Hunt syndrome /tō·lō′sä·hunt/ [Eduardo S. Tolosa, Spanish neurosurgeon, 1900–1981; William Edward Hunt, American neurosurgeon, 1921–1999], unilateral ophthalmoplegia associated with pain behind the orbit and in the area supplied by the first division of the trigeminal nerve; it is thought to result from nonspecific inflammation and granulation tissue in the superior orbital fissure or cavernous sinus. Compare **cavernous sinus syndrome.**

tolterodine, a muscarinic receptor antagonist.

■ INDICATIONS: It is used to treat overactive bladder (frequency and urgency). It controls bladder incontinence by controlling contractions.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity, uncontrolled narrow-angle glaucoma, urinary retention, and gastric retention.

■ ADVERSE EFFECTS: Adverse effects include paresthesia, fatigue, headache, chest pain, hypertension, vision abnormalities, xerophthalmia, abdominal pain, constipation, dry mouth, dyspepsia, dysuria, urinary retention, urinary frequency, urinary tract infection, rash, pruritus, bronchitis, cough, pharyngitis, and upper respiratory infection. Common side effects include anxiety, dizziness, nausea, vomiting, and anorexia.

toluene ($C_6H_5CH_3$) /tol′yo͞o·ēn/, an aromatic, colorless, flammable liquid produced from coal tar, petroleum, or Peruvian tolu balsam. It is used in dyes, explosives, gums, and lacquers and in the manufacture of drugs and the extraction of organic chemicals from plants.

-tome, **1.** suffix meaning a “cutting instrument”: *labiotome, neurotome, thyrotome.* **2.** combining form meaning a “(specified) segment or region”: *dermomyotome, pleurotome, viscerotome.*

-tomic, -tomical, suffix meaning “incisions or sections of tissue”: *dermatomic, phlebotomic, somatomic.*

tomo-, prefix meaning “preparation of a section or layer”: *tomograph.*

tomogram /tō′məgram′/ [Gk, *tome,* section, *gramma,* record], a radiograph produced by tomography.

tomograph /tō′məgraf′/ [Gk, *tome,* section, *graphein,* to record], a radiographic apparatus that makes an image of layers of body tissues at various depths.

tomographic DSA /-graf′ik/, the visualization of blood vessels in the body in three dimensions. See also **digital subtraction angiography.**

tomography /təmog′rəfē/ [Gk, *tome* + *graphein,* to record], **1.** sectional imaging. **2.** a radiographic technique in which the tube and film are moved synchronously during exposure, producing a blurred radiograph in which objects within the focal plane are seen more clearly than objects outside the focal plane. **3.** a radiographic technique that produces a film representing a detailed cross section of tissue at a predetermined depth. It is a valuable diagnostic tool for the discovery and identification of space-occupying lesions such as might be found in the brain, liver, pancreas, and gallbladder. See also **computed tomography, positron emission tomography.**

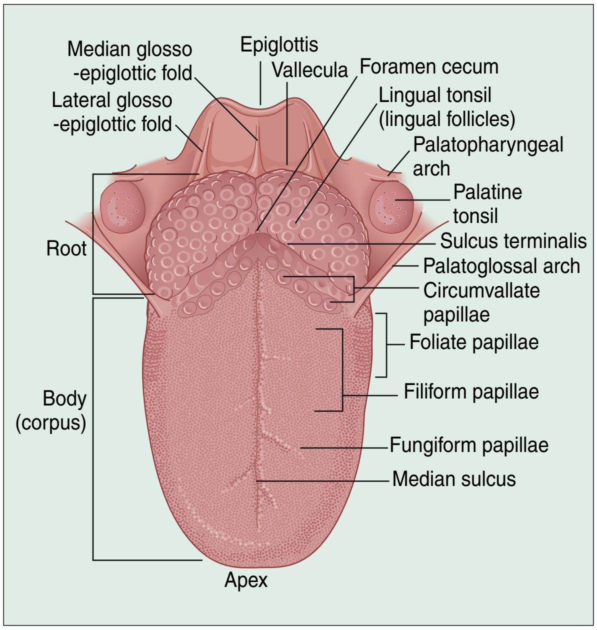
-tomy, suffix meaning a “surgical incision”: *cystotomy, oncotomy, phlebotomy.*

tonaphasia. See **amusia.**

tone. See **tonus.**

tone deafness [Gk, *tonos,* stretching; AS, *deaf*], an inability to detect the pitch or changing pitch of a musical note or a voice change.

tongue /tung/ [AS, *tunge*], the principal organ of the sense of taste that also assists in the mastication and deglutition of food. It is located in the floor of the mouth within the curve of the mandible. Its root is connected to the hyoid bone posteriorly. It is also connected to the epiglottis, soft palate, and pharynx. The apex of the tongue rests anteriorly against the lingual surfaces of the lower incisors. The mucous membrane connecting the tongue to the mandible reflects over the floor of the mouth to the lingual surface of the gingiva and in the midline of the floor is raised into a vertical fold. The dorsum of the tongue is divided into symmetric halves by a median sulcus, which ends posteriorly in the foramen cecum. A shallow sulcus terminalis runs from this foramen laterally and forward on either side to the margin of the organ. From the sulcus the anterior two thirds of the tongue are covered with papillae. The posterior third is smoother and contains numerous mucous glands and lymph follicles. The use of the tongue as an organ of speech is not anatomical but a secondary acquired characteristic. Also called **glossa, lingua.**



Tongue *(Cohen, 2005)*

tongue deviation. See **deviation of tongue.**

tongue-thrust swallow, an immature form of swallowing in which the tongue is projected forward instead of retracted during the act of swallowing. It may result in forward displacement of the maxilla with consequent malocclusion of the teeth.

tongue-tie. See **ankyloglossia.**

-tonia, -tony, suffix meaning “tone, (condition or degree of) muscle tension”: *angiotonia, hemotonia, neurotony, vagotony, vasotonia.*

tonic /ton′ik/, pertaining to a type of afferent or sensory nerve receptor that responds to length changes placed on the noncontractile part of a muscle spindle. It may be triggered by a mechanical external force such as positioning or by an internal stretch caused by intrafusal muscle contraction.

-tonic, **1.** combining form meaning the “quality of muscle contraction or tonus”: *hypertonic, myatonic, normotonic.* **2.** combining form meaning a “solution with a comparative concentration”: *hypertonic, hypotonic, isotonic.*

tonic bite, reflexive, sustained jaw closure, accompanied by increased abnormal tone in the jaw muscles, in response to stimulation of the teeth or gums. It is difficult to release, and its force can damage the teeth or an object placed in the mouth.

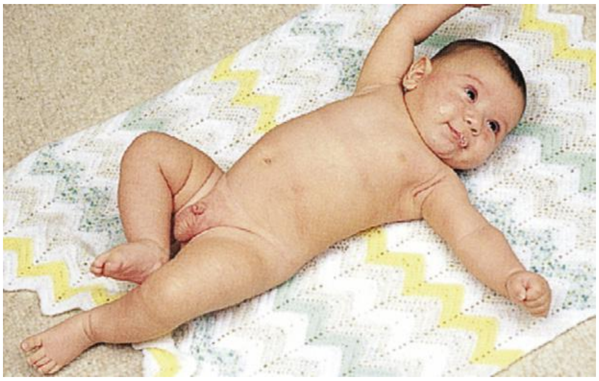
tonic-clonic seizure, an epileptic seizure characterized by a generalized involuntary muscular contraction and cessation of respiration followed by tonic and clonic spasms of the muscles. Breathing resumes with noisy respirations. The teeth may be clenched, the tongue bitten, and control of the bladder or bowel lost. As this phase of the seizure passes, the person may fall asleep or experience confusion. Usually the person has no recall of the seizure on awakening. A sensory warning, or aura, can precede each tonic-clonic seizure. These seizures may occur singly, at intervals, or in close succession. Anticonvulsant medications are usually prescribed as prophylaxis against tonic-clonic seizures. Also called **grand mal seizure.** Compare **absence seizure, focal seizure, psychomotor seizure.**

tonic convulsion [Gk, *tonos,* stretching; L, *convulsio,* cramp], a prolonged generalized contraction of the skeletal muscles. Also called *tonic contraction.* See also **physiological tetanus.**

tonicity /tōnis′itē/ [Gk, *tonikos,* stretching], the quality of possessing tone, or tonus.

tonic labyrinthine reflex (TLR) [Gk, *tonikos* + *labyrinthos,* maze; L, *reflectere,* to bend back], a normal postural reflex in animals, abnormally accentuated in decerebrate humans, characterized by extension of all four limbs when the head is positioned in space at an angle above the horizontal in quadripeds or in the neutral erect position in humans. Also called **decerebrate rigidity.**

tonic neck reflex, a normal response in newborns characterized by extension of the arm and the leg on the side of the body to which the head is quickly turned while the infant is supine and to flex the limbs of the opposite side. The reflex, which prevents the infant from rolling over until adequate neurological and motor development occurs, disappears by 3 to 4 months of age, to be replaced by symmetric positioning of both sides of the body. Absence or persistence of the reflex may indicate central nervous system damage. Also called **asymmetric tonic neck reflex.** See also **symmetric tonic neck reflex.**



Tonic neck reflex
(Lowdermilk et al, 2012/Courtesy Marjorie Pyle, RNC, Lifecircle, Costa Mesa, California)

tonic pupil. See **Adie's pupil.**

tonic spasm [Gk, *tonos*, stretching, *spasmos*], a sustained contraction of a muscle. See **physiological tetanus.**

tonitrophobia /tonit′rōfō′bē·ə/, an abnormal fear of thunder.

tono-, prefix meaning "tone or tension": *tonoclonic, tonoplast, tonoscillograph*.

Tonocard, a trademark for a lidocaine-type oral antiarrhythmic drug **(tocainide hydrochloride).**

tonoclonic /ton′əklon′ik/ [Gk, *tonos*, stretching, *klonos*, tumult], pertaining to muscular spasms that are tonic and then clonic.

tonofibril /ton′əfī′bril/ [Gk, *tonos*, stretching, *fibrilla*, small fiber], a bundle of fine filaments found in the cytoplasm of epithelial cells. The individual strands, or **tonofilaments,** spread throughout the cytoplasm and extend into the intercellular bridge to converge at the desmosome. The system of fibers functions as a supportive element within the cytoskeleton. In keratinizing epithelium the strands are the main precursor of keratin. Also called **epitheliofibril, tenofibril.** See also **keratohyalin.**

tonofilament /ton′ōfil′əmənt/ [Gk, *tonos*, stretching], a proteinaceous fiber found in epithelial cells. Bundles of tonofilaments form a tonofibril, which has a supporting function.

tonograph /ton′əgraf/, an apparatus that makes a record of tension measurements.

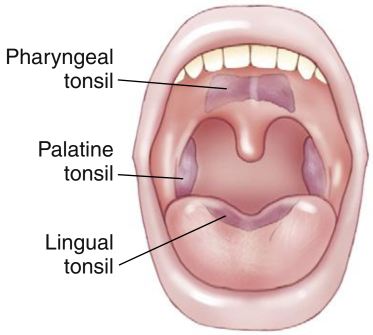
tonography /tōnog′rəfē/, **1.** the measurement over time of intraocular pressure with graphic documentation. **2.** the measurement of tension.

tonometer /tōnom′ətər/ [Gk, *tonos* + *metron*, measure], an instrument used in measuring tension or pressure, especially intraocular pressure.

tonometry /tōnom′ətrē/, the measuring of intraocular pressure by determining the resistance of the eyeball to indentation by an applied force. Several kinds of tonometers are used. The air-puff tonometer, which does not touch the eye, records deflections of the cornea from a puff of pressurized air. The Schiötz impression and the applanation tonometers record the pressure needed to indent or flatten the corneal surface. Applanation tonometry at the slit lamp is considered most accurate. Schiötz tonometry is rarely done today.

tonoscillograph /ton′əsil′əgraf′/, an apparatus that records arterial and capillary pressures with a corresponding pulse tracing.

tonsil /ton′səl/ [L, *tonsilla*], a small rounded mass of tissue, especially lymphoid tissue, such as that composing the palatine tonsils in the oropharynx. Also called **tonsilla.** Compare **intestinal tonsil, lingual tonsil, palatine tonsil, pharyngeal tonsil.**



Tonsils *(Leonard, 2009)*

tonsill-, prefix meaning "tonsils": *tonsillectomy, tonsillith, tonsillitis*.

tonsilla. See **tonsil.**

tonsillar /ton′silər/ [L, *tonsilla*], pertaining to the palatine tonsil.

tonsillar crypt [L, *tonsilla* + Gk, *kryptos*, hidden], a small slitlike invagination on the surface of a palatine or pharyngeal tonsil.

tonsillar fossa. See **amygdaloid fossa.**

tonsillar herniation [L, *tonsilla* + *hernia*, rupture], the herniation of tonsils of the cerebellum through the foramen magnum of the skull. It may occur as a result of intracranial pressure from an injury or tumor.

tonsillar ring. See **Waldeyer's throat ring.**

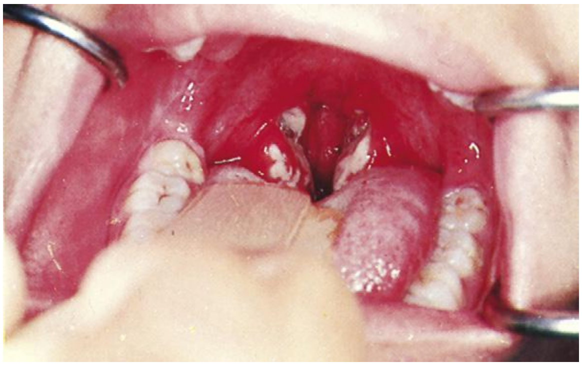
tonsillectomy /ton′silek′təmē/ [L, *tonsilla* + Gk, *ektomē*, excision], the surgical excision of the palatine tonsils, performed to prevent recurrent tonsillitis. Before surgery several laboratory tests, including a bleeding and clotting time, complete blood count, and urinalysis, are done. Tonsillar tissue is dissected and removed, usually with the patient under general anesthesia, and bleeding areas are sutured or cauterized. An increase in pulse rate, falling blood pressure, restlessness, or frequent swallowing warns of possible hemorrhage. When the patient has recovered from anesthesia, ice chips or clear liquids without a drinking straw may be offered. Tonsillectomy is often combined with adenoidectomy. Compare **adenectomy, adenotonsillectomy.**

tonsillitis /-ī′tis/, an infection or inflammation of a tonsil. Acute tonsillitis, frequently caused by *Streptococcus* infection, is characterized by severe sore throat, fever, headache, malaise, difficulty in swallowing, earache, and enlarged tender lymph nodes in the neck. Acute tonsillitis may accompany scarlet fever. Treatment includes systemic antibiotics, analgesics, and warm irrigations of the throat. Soft foods and ample fluids are given. Tonsillectomy is sometimes performed for recurrent tonsillitis or tonsillar abscess. See also **acute tonsillitis, peritonsillar abscess, scarlet fever, strep throat.**

■ OBSERVATIONS: Symptoms include a moderate to severe sore throat, lasting longer than 2 days; difficulty swallowing; pain referred to the ears; enlarged anterior cervical nodes; fever and chills; headache; muscle and joint pain; anorexia; increased secretions from the throat; enlarged, reddened, inflamed tonsils; pus or exudate on the tonsils; halitosis; and edematous or inflamed uvula. Symptoms often last 2 to 3 days after treatment is initiated. Diagnosis is made by direct inspection of the throat and tonsils, and throat cultures are used to identify the causative organism. If not treated, the following can occur: peritonsillar abscess, airway occlusion, rheumatic fever and subsequent cardiovascular disorders, kidney failure, or poststreptococcal glomerulonephritis.

■ INTERVENTIONS: Treatment is directed at the symptoms. Antibiotics are given if the cause is bacterial. Analgesics are used for pain relief. Tonsillectomy is indicated for massive hypertrophy that restricts breathing or obstructs the airway. Adenoidectomy is indicated for hypertrophy of adenoids that obstruct nasal breathing.

■ NURSING CONSIDERATIONS: Nursing care is focused on provision of comfort and rest. Warm, bland fluids or very cold fluids, saltwater gargles, and throat lozenges may alleviate throat discomfort. A cool mist vaporizer and adequate fluids keep mucous membranes moist. Postsurgical care is aimed at prevention of hemorrhage, prevention of aspiration of drainage, and control of pain. The child is positioned on side until fully alert to facilitate drainage of secretions and prevent aspiration. Suctioning is done with care to prevent trauma to the oropharynx. Frequent assessment for bleeding is done with direct visualization of the surgical site. Continual swallowing by child is an obvious sign of early bleeding. Coughing, clearing of throat, and nose blowing are discouraged and activity is limited to prevent hemorrhage. An ice collar may be applied to help alleviate discomfort from sore throat. Continuous pain control and mild sedation is necessary to prevent crying, which can irritate the operative site and promote hemorrhage. Parents should be educated about signs of hemorrhage and prevention (limiting activity, discouraging coughing, clearing throat, avoiding throat irritants, gargles). Instruction is given to treat any sign of bleeding as a medical emergency.



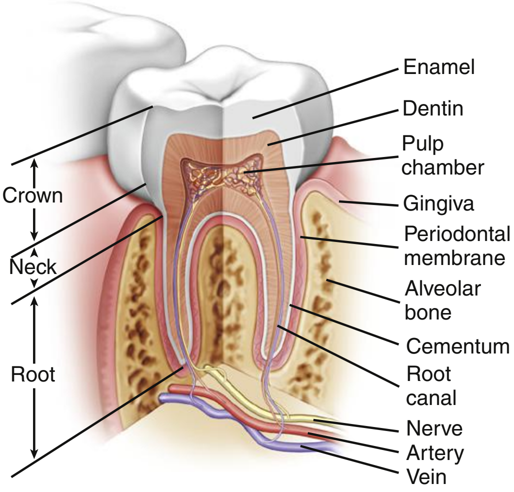
Tonsillitis *(Hockenberry and Wilson, 2011/Courtesy Dr. Edward L. Applebaum, Head, Department of Otolaryngology, University of Illinois Medical Center, Chicago, Illinois)*

tonsilloadenoidectomy /ton′silō·ad′ənoidek′təmē/ [L, *tonsilla* + Gk, *aden,* gland, *eidos,* form, *ektomē,* excision], the surgical removal of tonsil and adenoid tissues.

tonus /tō′nəs/ [Gk, *tonos,* stretching], **1.** also called **muscle tone.** The normal state of balanced tension in the body tissues, especially the muscles. Partial contraction or alternate contraction and relaxation of neighboring fibers of a group of muscles hold the organ or the part of the body in a neutral functional position without fatigue. Tonus is essential for many normal body functions, such as holding the spine erect, the eyes open, and the jaw closed. **2.** also called **tone,** the state of the body tissues being strong and fit.

-tony. See **-tonia.**

tooth *pl.* **teeth** [AS, *toth*], any one of numerous dental structures that develop in the jaws. Although derived from modified bone, they are typically classified as part of the digestive system and are used to cut and grind food in the mouth for ingestion. Each tooth consists of a crown, which projects above the gum; two to four roots embedded in the alveolus; and a neck, which stretches between the crown and the root. Each tooth also contains a cavity filled with pulp, richly supplied with blood vessels and nerves that enter the cavity through a small aperture at the base of each root. The solid part of the tooth consists of dentin, enamel, and a thin layer of bone on the surface of the root. The dentin composes the bulk of the tooth. The enamel covers the exposed part of the crown. Two sets of teeth appear at different periods of life: the 20 primary teeth appear during infancy, the 32 secondary teeth during childhood and early adulthood. See also **primary dentition, secondary dentition.**



Tooth *(Harkreader, Hogan, and Thobaben, 2007)*

tooth abscess [AS, *toth* + L, *abscedere,* to go away], a collection of pus on a tooth, usually close to the root and often the result of a localized infection. If untreated, the pressure of the abscess may destroy the alveolar bone and adjoining soft tissues. Also called **dental abscess.** See also **periapical abscess.**

toothache /to͞o′thāk/ [AS, *toth* + *aeca*], pain in a tooth, usually caused by pulpal infection or damage. Also called **dentalgia, odontalgia, odontodynia.** See also **pulpitis.**

tooth alignment, the arrangement of the teeth in relation to their supporting bone or alveolar process, adjacent teeth, and opposing dentition.

tooth bleaching, the process of removing stains or color from teeth by applying chemicals, such as hydrogen peroxide or urea peroxide.

tooth-borne, describing a dental prosthesis or part of a prosthesis that depends entirely on abutment teeth for support.

tooth-borne base, a denture base restoring an edentulous area that has abutment teeth at each end for support. The residual alveolar ridge tissue that it covers is not used to support the base. See **supporting area.**

toothbrush, an implement of various designs, with bristles, available in a variety of differing amounts of bristle flexibility, fixed to a head at the end of a handle, used for cleaning the teeth and cleaning and massaging the gingival tissues.

tooth eruption, the final stage of odontogenesis, in which a tooth breaks out from its crypt through surrounding tissue.

tooth form, the identifying curves, lines, angles, and contours of a tooth that differentiate it from other teeth.

tooth fulcrum, the axis of movement of a tooth subjected to lateral forces. It is considered to be at the middle third of the part of the tooth root embedded in the alveolus.

tooth germ, a primitive cell in the embryo that is the precursor of a tooth.

tooth inclination, the angle of slope of a tooth or teeth from the vertical plane. Inclinations may be mesial, distal, lingual, buccal, or labial.

toothpaste. See **dentifrice.**

tooth rotation [AS, *toth* + L, *rotare,* to rotate], **1.** the turning of a tooth around its longitudinal axis. **2.** the process by which a tooth is turned.

tooth size discrepancy, lack of harmony of size of individual teeth or groups of teeth when related to those within the same arch or the opposing arch.

TOP, abbreviation for *t*emporal, *o*ccipital, and *p*arietal regions of the skull.

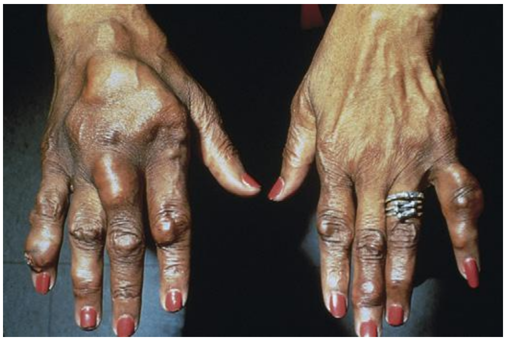
top-, topo-, prefix meaning "place or location": *topalgia, topesthesia, topognosia*.

topesthesia. See **topognosis.**

tophaceous /tōfā′shəs/, pertaining to the presence of chalky accumulations of uric acid crystals (tophi). See also **tophus.**

tophaceous gout [L, *tufa,* porous rock], a form of purine metabolism disorder characterized by formation of chalky deposits of sodium biurate under the skin and in the joints. If untreated, the deposits may eventually destroy the involved joints.

tophus /tō′fəs/ *pl.* **tophi** [L, *tufa,* porous rock], a calculus containing sodium urate that develops in fibrous tissue around joints, typically in patients with gout. **-tophaceous,** *adj.*



Tophus *(Swartz, 2009)*

-topia, -topy, suffix meaning "(condition of) placement of organs in the body": *heterotopia, normotopia, skeletopia*.

topical /top′ikəl/ [Gk, *topos,* place], **1.** pertaining to the surface of a part of the body. **2.** pertaining to a drug or treatment applied topically.

topical anesthesia, anesthesia produced by application of a local anesthetic in the form of a solution, gel, or ointment to the skin, mucous membrane, or cornea. The most common agents include benzocaine, lidocaine, and tetracaine. Cocaine may be applied in solution to the mucous membranes of the nasal passages for certain surgical procedures. Also called **surface anesthesia.** Compare **general anesthesia, local anesthesia, regional anesthesia.**

Topicort, a trademark for a topical glucocorticoid **(desoximetasone).**

topiramate, a miscellaneous anticonvulsant.

■ INDICATIONS: It is used to treat partial seizures, with or without generalization in adults.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects include upper respiratory infection, pharyngitis, sinusitis, diplopia, vision abnormality, rash, weight loss, leukopenia, dizziness, fatigue, cognitive disorder, insomnia, anxiety, depression, paresthesia, weight loss, diarrhea, anorexia, nausea, dyspepsia, abdominal pain, constipation, dry mouth, breast pain, dysmenorrhea, and menstrual disorder.

topo-. See **top-.**

topoanesthesia. See **atopognosia.**

topognosis /top′ognō′sis/ [Gk, *topos* + *gnosis,* recognition], the ability to recognize tactile stimuli. Also called **topesthesia.**

topogometer /top′ōgom′ətər/ [Gk, *topos,* place, *gonia,* angle, *metron,* measure], a movable fixation target attached to an instrument for measuring the radius of curvature of the cornea. It is used in fitting contact lenses of correct curvature.

topographic /top′əgraf′ik/, (in psychiatry) pertaining to a freudian conceptualization of the layers of human consciousness.

topographic anatomy [Gk, *topos,* place, *graphein,* to record, *ana* + *temnein,* to cut], the study of a specific region of a body structure, such as a lower leg, including all of the systems in the part and their relationship to each other. Also called **regional anatomy.**

topographic disorientation, a psychiatric disorder based on Freud's topographic model of the mental apparatus, consisting of conscious, preconscious, and unconscious systems for interpreting perceptions of the outside world and internal perceptions. Under certain conditions, such as frustration or sleep, psychic energy reanimates unconscious memories, resulting in hallucinations in mental disorders.

topography /təpog′refē/ [Gk, *topos,* place, *graphein,* to record], the anatomical description of a body part in terms of the region in which it is located.

topoisomerase /to′po-i′so-mer-ās/, an enzyme involved in mobilization and replication of DNA during cell division.

topoisomerase inhibitors, a class of antineoplastic agents that interfere with the arrangement of DNA in cells.

topology /təpol′əjē/, **1.** orientation of the presenting part of a fetus. **2.** the study of special regions of anatomy. **3.** the science of properties of geometric configuration.

topotecan, an antineoplastic hormone.

■ INDICATION: It is used to treat metastatic carcinoma of the ovary after failure of traditional chemotherapy.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug are known hypersensitivity, lactation, and severe bone marrow depression.

■ ADVERSE EFFECTS: Life-threatening effects are neutropenia, leukopenia, thrombocytopenia, anemia, and sepsis. Other adverse effects are abdominal pain, constipation, diarrhea, obstruction, nausea, stomatitis, vomiting, increased alanine aminotransferase and aspartate aminotransferase, anorexia, arthralgia, asthenia, headache, myalgia, pain, dyspnea, and total alopecia.

TOPV, abbreviation for *trivalent oral polio vaccine*.

TORCH /tôrch/, abbreviation for *t*oxoplasmosis, *o*ther, *r*ubella virus, *c*ytomegalovirus, and *h*erpes simplex viruses, a group of agents that can infect the fetus or the newborn, causing a constellation of morbid effects called the TORCH syndrome.

TORCH syndrome, infection of the fetus or newborn by one of the TORCH agents. The outcomes of a pregnancy complicated by a TORCH agent may be abortion, stillbirth, intrauterine growth retardation, or premature delivery.

■ OBSERVATIONS: At delivery and during the first days after birth an infant infected with any one of the organisms may demonstrate various clinical manifestations, such as fever, lethargy, poor feeding, petechiae on the skin, purpura, pneumonia, hepatosplenomegaly, jaundice, hemolytic and other anemias, encephalitis, microcephaly, hydrocephalus, intracranial calcifications, hearing deficits, chorioretinitis, and microphthalmia. In addition, each of the agents is associated with several other abnormal clinical findings involving abnormal immune response, cataracts, glaucoma, vesicles, ulcers, and congenital cardiac defects.

■ INTERVENTIONS: Before pregnancy, women may be tested for susceptibility to the rubella virus and inoculated against it if not immune. There are currently no vaccines that confer immunity to the other TORCH agents, but the mother may be serologically tested for antibody levels to them.

During pregnancy toxoplasmosis is asymptomatic in about 90% of cases, making diagnosis unlikely. If infection is suspected, serial paired serological tests are performed. A high, rising titer indicates recent infection. Transplacental infection occurs in 35% of mothers infected during pregnancy. If the mother contracts infection in the first trimester, before the placenta is fully developed, the infant may not become infected. If the fetus contracts the infection, severe congenital manifestations of the syndrome usually occur. If the fetus is infected after the first trimester, the baby is usually born with asymptomatic or mild disease. The infection may be spread from the baby during the newborn period. SulfADIAZINE, pyrimethamine, and folic acid are sometimes given to treat the infection. Primary cytomegalovirus infection during pregnancy is usually asymptomatic. If the infection is suspected, serological testing may be performed to demonstrate primary infection because infants born to mothers infected for the first time during pregnancy are much more likely to develop severe congenital anomalies than if the infection is a reactivation of previous cytomegalovirus infection. There is no specific treatment. The child is considered to be infectious, but contagion among newborns from a congenitally infected infant has not been proven. Transplacental rubella virus infection in pregnancy during the first 8 weeks is likely to cause infection in 50% of fetuses and to result in demonstrable defects in 85% of those infected. The risk becomes less as gestation increases to 24 weeks, after which time infection has not been known to result in defects. Rubella is the only TORCH virus that is usually symptomatic, and therefore it is often recognized. Many mothers infected during the first trimester choose to abort the pregnancy. There is no treatment for the infection, but screening and immunization before pregnancy could prevent virtually all cases of congenital rubella. Herpesvirus infection in pregnancy is rarely transplacentally transmitted to the fetus. Primary infection during pregnancy sometimes results in spontaneous abortion or premature delivery. In the newborn the infection is usually systemic and life-threatening. The fetus is most apt to become infected by the virus shed from an active genital lesion during vaginal delivery or as the result of vaginal examination or the placement of an intrauterine catheter or a fetal scalp electrode during labor. If the mother has active genital herpesvirus lesions, intrapartal internal monitoring is contraindicated, vaginal examinations are often omitted, regional anesthetic techniques are avoided, and the infant is delivered by cesarean section. The TORCH infections caused by other agents are asymptomatic in pregnancy, revealing themselves by the syndrome after birth. The congenital effects are not amenable to change or to amelioration by any known treatment.

TORCH test, a series of tests for diseases that exert recognized detrimental effects on the fetus (tests include *T*oxoplasmosis, *O*ther [including syphilis], *R*ubella, *C*ytomegalovirus, and *H*erpes), such as precipitating abortion or premature labor.

Torecan, a trademark for a phenothiazine antiemetic **(thiethylperazine maleate).**

toremifene, an antineoplastic.

■ INDICATIONS: It is used to treat advanced breast carcinoma that is not responsive to other therapy in estrogen-receptor-positive patients (usually postmenopausal).

■ CONTRAINDICATIONS: Known hypersensitivity to this drug and pregnancy prohibit its use.

■ ADVERSE EFFECTS: Life-threatening effects are thrombocytopenia and leukopenia. Other adverse effects include altered taste (anorexia), vaginal bleeding, pruritus vulvae, rash, alopecia, chest pain, depression, hypercalcemia, ocular lesions, retinopathy, corneal opacity, and blurred vision (high doses). Common side effects include nausea, vomiting, hot flashes, headache, and light-headedness.

Torisel, a trademark for **temsirolimus.**

Torkildsen's procedure. See **ventriculocisternostomy.**

Tornalate, a trademark for an orally inhaled bronchodilator **(bitolterol mesylate).**

torose /tôr′ōs/ [L, *torosus*, bulging], knoblike, knobby, or bulging.

torpor /tôr′pər/, **1.** a state of mental or physical inactivity. **2.** an absence or slowness of response to a stimulus.

torque /tôrk/ [L, *torquere*, to twist], **1.** a twisting force produced by contraction of the medial femoral muscles that tend to rotate the thigh medially. **2.** in dentistry, a force applied to a tooth to rotate it on a mesiodistal or buccolingual axis. **3.** a rotary force applied to a denture base. Compare **torsion.**

torr /tôr/ [Evangelista Torricelli, Italian physicist, 1608–1647], a unit of pressure equal to 1333.22 dynes/cm^2, or 1.33322 millibars. One torr is the pressure required to support a column of mercury 1 mm high when the mercury is of standard density and subjected to standard acceleration. These standard conditions are 0° C and 45° latitude, where the acceleration of gravity is 980.6 cm/sec^2. In reading a mercury barometer at other temperatures and latitudes, corrections commonly exceeding 2 torr may be required to compensate for the thermal expansion of the measuring scale used.

tors-, prefix meaning "twisted": *torsiometer, torsive, torsiversion*.

torsades de pointes /tôrsäd′ de pô·aNt′, tôr′sād də point′/ [Fr, *torsader*, to twist together, *pointes*, tips], a type of ventricular tachycardia with a spiral-like appearance ("twisting of the points") and complexes that at first look positive and then negative on an electrocardiogram. It is precipitated by a long Q-T interval, which often is induced by drugs (quinidine, procainamide, or disopyramide) but which may be the result of hypokalemia, hypomagnesemia, or profound bradycardia. The first line of treatment is IV magnesium sulfate, as well as defibrillation if the patient is unstable. See also **long QT syndrome.**

torsemide /tor′sĕ-mīd/, a loop diuretic related to sulfonylurea, used in treatment of edema and hypertension. It is administered orally or intravenously.

torsiometer /tôr′sē·om′ətər/, a device for measuring the amount of torsion of an eye around its anteroposterior axis.

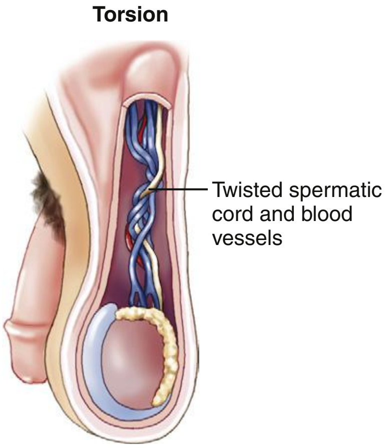
torsion /tôr′shən/ [L, *torquere*, to twist], **1.** the process of twisting in a positive (clockwise) or negative (counterclockwise) direction. **2.** the state of being turned. **3.** (in dentistry) the twisting of a tooth on its long axis.

torsion angle, the angle between the axes of any two different portions of long bones, such as between the head and neck of the femur and its long axis.

torsion dystonia. See **dystonia musculorum deformans.**

torsion fracture, a spiral fracture, usually caused by a torsion injury.

torsion of the testis, the axial rotation of the spermatic cord that cuts off the blood supply to the testicle, epididymis, and other structures. Complete ischemia for 6 hours may result in gangrene of the testis. Partial loss of circulation may result in atrophy. Certain testes are anatomically predisposed to torsion because of inadequate connective tissue, but the condition may be caused by trauma with severe swelling. Torsion of the testis occurs more often on the left than on the right side and is most frequent in the first year of life and during puberty. Surgical correction is required in most cases; if performed within 5 hours of the onset of symptoms, the testis can usually be saved.



Torsion of the testis *(Leonard, 2009)*

torsion spasm. See **dystonia musculorum deformans.**

torso /tôr′sō/ [L, *thyrsus,* stem], the body excluding the head and limbs. Also called **trunk.**

tort [L, *tortus,* twisted], (in law) a civil wrong, other than a breach of contract. Torts include negligence, false imprisonment, assault, and battery. The elements of a tort are a legal duty owed by the defendant to the plaintiff, a breach of duty, and damage from the breach of duty. A tort may be constitutional, in which one person deprives another of a right or immunity guaranteed by the Constitution; personal, in which a person or a person's reputation or feelings are injured; or intentional, in which the wrong is a deliberate act that is unlawful. Many other kinds of torts exist. **—tortious,** *adj.*

torticollis /tôr′tikol′is/ [L, *tortus,* twisted, *collum,* neck], an abnormal condition in which the head is inclined to one side as a result of the contraction of muscles on that side of the neck. It may be congenital or acquired. Treatment may include surgery, heat, support, or immobilization, depending on the cause and severity of the condition. Also called **wryneck.** See also **spasmodic torticollis.**

tortious. See **tort.**

tortipelvis /-pel′vis/ [L, *tortus,* twisted, *pelvis,* basin], a form of muscular dystonia resulting in a distortion of the pelvis or the spine and hips.

tortuous /tôr′cho͞o·əs/ [L, *tortus,* twisted], having or making twists and turns.

Torula histolytica. See ***Cryptococcus neoformans.***

Torulopsis, a genus of Fungi Imperfecti of the family Cryptococcaceae; it is closely related to *Candida,* and some authorities have considered it the same genus. Some species are normal inhabitants of the skin, respiratory tract, GI tract, and urogenital region but may also cause opportunistic infections.

Torulopsis glabrata, a species of fungus that is part of the normal flora of the human mouth, gut, and urinary tract but that in weak or immunocompromised patients may cause opportunistic infections such as meningitis, pneumonia, cystitis, and fungemia. Formerly called ***Candida glabrata.***

torulopsosis /tôr′yəlopsō′sis, tôr′yo͝olop′səsis/ [L, *torulus,* small swelling; Gk, *opsis,* appearance, *osis,* condition], an infection with the yeast *Torulopsis glabrata,* a normal inhabitant of the oropharynx, GI tract, and skin. *T. glabrata* causes disease in severely debilitated patients, in those with impaired immune function, and sometimes in those having prolonged urinary catheterization. Systemic infection is usually treated with amphotericin B.

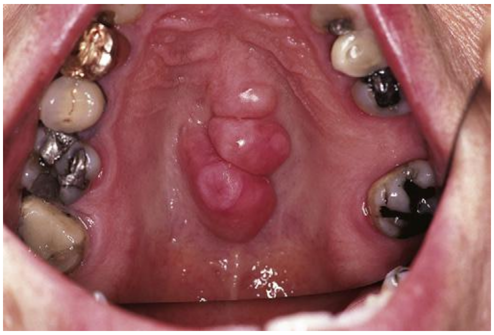
torulosis. See **cryptococcosis.**

torus fracture. See **lead pipe fracture.**

torus levatorius, a broad fold or elevation in the nasopharynx that appears to emerge from just under the opening of the pharyngotympanic tube, continues medially onto the upper surface of the soft palate, and overlies the levator veli palatini muscle.

torus mandibularis. See **mandibular torus.**

torus palatinus. See **palatine torus.**

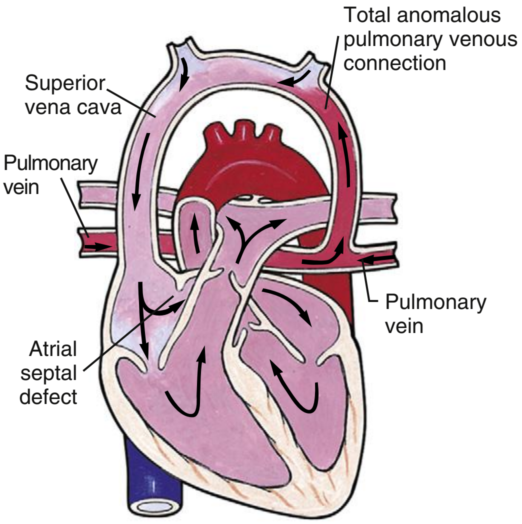


Torus palatinus *(Regezi, Sciubba, and Jordan, 2008)*

torus tubarius, an elevation of the rim of the pharyngotympanic tube where it projects into the nasopharynx. Posterior to the torus tubarius is a deep recess, the **pharyngeal recess.** Also called **Eustachian cushion, tubal prominence.**

total allergy syndrome, a condition of hypersensitivity to a wide range of substances, including pesticides, insecticides, pharmaceutics, certain metals, and chemicals used in the manufacture of plastics and epoxy resins. Also called **twentieth-century syndrome.**

total anomalous venous return [L, *totus,* whole; Gk, *anomalos,* uneven; L, *vena,* vein; ME, *retournen,* to turn back], a rare congenital cardiac anomaly in which the pulmonary veins attach to the right atrium or to various veins draining into the right atrium rather than to the left atrium. These alternate pathways of venous return to the left-sided circulation may be insufficient and cause obstruction, resulting in symptoms. Clinical manifestations include cyanosis,



Total anomalous venous return
(Hockenberry and Wilson, 2011)

pulmonary congestion, and heart failure. Other cardiac defects also may be present, such as atrial septal defect, which shunts blood from the right atrium to the left atrium and helps decompress the right atrium. Corrective surgery is indicated, usually after 1 year of age, but may be necessary at an earlier age if pulmonary venous obstruction or severe congestive heart failure is present. See also **congenital cardiac anomaly.**

total body electric conductivity (TOBEC), a method of measuring body composition by the differences in electric conductivity of fat, bone, and muscle. It is used for monitoring fitness of athletes; in clinical studies of weight control in which physicians want to determine if weight loss is caused by fat, water, or other tissues; and in measurement of fat content of dietary meats. See also **bioelectric impedance analysis.**

total body radiation, radiation that exposes the entire body and, theoretically, all cells in the body.

total body water (TBW), all the water within the body, including intracellular and extracellular water plus the water in the GI and urinary tracts.

total cell volume (TCV), a measure of the adequacy of urea clearance of a hemodialyzer, calculated as the volume of saline necessary to fill its blood compartment. It declines slightly with each reuse of the dialyzer.

total cleavage, mitotic division of a fertilized ovum into blastomeres. Compare **partial cleavage.**

total color blindness. See **color blindness.**

total communication, the combined use of oral language and manual communication by a person with hearing loss.

total elbow arthroplasty, arthroplasty of both sides of the elbow joint, with humeral and ulnar components.

total hip arthroplasty (THA), arthroplasty of both sides of the hip joint, with acetabular and femoral components. See also **total hip replacement.**

total hip replacement, a surgical procedure to correct a hip joint damaged by degenerative disease, often arthritis. The head of the femur and the acetabulum are replaced with metal components. The acetabulum is plastic-coated to avoid metal-to-metal articulating surfaces. See also **total hip arthroplasty, total joint replacement.**

total hysterectomy. See **hysterectomy.**

total intravenous anesthesia (TIVA), anesthesia using only IV agents without the use of inhalational agents. Drugs used are generally of short duration of action and half-life in order to reduce the risks associated with accumulation. TIVA avoids unwanted effects of inhalational agents and the need for complex apparatus.

total iron, the total iron concentration in the blood. The serum reference interval is 50 to 150 mg/dL.

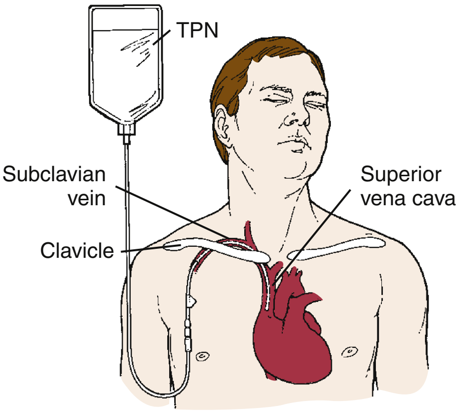
total joint replacement, a surgical procedure for the treatment of severe arthritis and other disorders in which the normal articulating surfaces of a joint are replaced by metal and plastic prostheses. The operation most commonly involves replacement of the hip joint, although the knee and other joints may also be replaced. Also called *total joint arthroplasty.*

total lung capacity (TLC), the volume of gas in the lungs at the end of a maximum inspiration. It equals the vital capacity plus the residual capacity.

total lymphoid irradiation (TLI), a method of inducing a strong immunosuppressive effect in patients undergoing bone marrow transplants, treatment of certain lymphomas, or other therapies requiring immunosuppression. TLI involves exposing all lymph nodes, the thymus, and spleen to a total of 2000 rad in 100-rad doses from a linear accelerator before graft implantation.

total macroglobulins, the heavy serum macroglobulins that are elevated in various diseases, such as cancer, and infections. The normal concentrations in serum are 70 to 430 mg/dL.

total parenteral nutrition (TPN), the administration of a nutritionally adequate hypertonic solution consisting of glucose, protein hydrolysates, minerals, and vitamins through an indwelling catheter into the superior vena cava or other main vein. Fat is also provided in a three-in-one solution or "piggy-backed." The high rate of blood flow results in rapid dilution of the solution, and full nutritional requirements can be met indefinitely. The procedure is used in prolonged coma, severe uncontrolled malabsorption, extensive burns, GI fistulas, and other conditions in which feeding by mouth cannot provide adequate amounts of the essential nutrients. In infants and children it is used when feeding via the GI tract is impossible, inadequate, or hazardous, such as in chronic intestinal obstruction from peritoneal sepsis or adhesions, inadequate intestinal length, or chronic nonremitting severe diarrhea. The hyperalimentation solution is infused through conventional tubing with an IV filter attached to remove any contaminates. In adults the catheter is placed directly into the subclavian vein and threaded through the right innominate vein into the superior vena cava. In infants and small children the catheter is usually threaded to the central venous location by way of the jugular vein, which is entered through a subcutaneous tunnel beneath the scalp. Strict asepsis must be maintained because infection is a grave and present danger of this therapy. Also called **hyperalimentation, intravenous alimentation, parenteral hyperalimentation,** *total parenteral alimentation.*



Total parenteral nutrition: adult

total parenteral nutrition (TPN) administration, a nursing intervention from the Nursing Interventions Classification (NIC) defined as preparation and delivery of nutrients intravenously and monitoring of patient responsiveness. See also **Nursing Interventions Classification.**

total peripheral resistance, the overall resistance to blood flow through the systemic blood vessels.

total quality management (TQM), an approach to the improvement of the provision of services based on the premise that the overwhelming majority of quality failures are the result of flaws in processes and that quality can be improved by controlling these processes. TQM replaces traditional methods of quality management based on the identification and correction of problems as they occur and requires the participation of all members of an organization in improving processes, products, services, and the culture in which they work. TQM involves creation of an organizational structure for identifying and improving processes, the use of data-based statistical analysis to study processes, and the empowerment of employees to take responsibility for their own tasks in a way that encourages both continuous learning and personal responsibility. In a health care setting, this means a shift from an emphasis on tasks to an emphasis on outcomes of care, which provide the data. See also **continuous quality improvement.**

total renal blood flow (TRBF), the total volume of blood that flows into the renal arteries. The average TRBF in a normal adult is 1200 mL per minute. Compare **glomerular filtration rate.**

total thyroxine (T_4) test, a blood test that directly measures the total amount of T_4 present in the patient's blood, with abnormal values indicating either hyperthyroid or hypothyroid states. This test is also used to monitor replacement suppressive therapy.

totem /tō′təm/, an animal, plant, force of nature, or inanimate object that represents the tribal ancestor of a clan. It also serves as a tutelary spirit and protector and may communicate through oracles.

totipotency /tō′tipō′tənsē/, the ability of a cell, particularly a zygote, to differentiate into any of a number of specialized cells and thus form a new organism or regenerate a body part. Also called *totipotence*.

totipotential cell, an embryonic cell that is capable of developing into any variety of body cells.

touch^1 /tuch/ [Fr, *toucher,* to touch], **1.** *n,* the ability to feel objects and to distinguish their various characteristics; the tactile sense. **2.** *n,* the ability to perceive pressure when it is exerted on the skin or mucosa of the body. **3.** *v,* to palpate or examine with the hand.

touch^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as providing comfort and communication through purposeful tactile contact. See also **Nursing Interventions Classification.**

Technique for testing light touch
(Swartz, 2009)

touch deprivation, a lack of tactile stimulation, especially in early infancy. If continued for a sufficient length of time, it may lead to serious developmental and emotional disturbances, such as stunted growth, personality disorders, and social regression. In severe cases a child who is deprived of adequate physical handling and emotional stimulation may not survive infancy. See also **hospitalism.**

touch receptors [Fr, *toucher* + L, *recipere,* to receive], specialized sensory nerve endings that are sensitive to tactile stimuli.

Tourette's syndrome /too-rets′/. See **Gilles de la Tourette's syndrome.**

tourniquet /tur′nikit, to͝or′-/ [Fr, turnstile], a device used in controlling hemorrhage, consisting of a wide constricting band applied to the limb close to the site of bleeding. The use of a tourniquet is a drastic measure and is to be used only if the hemorrhage is life-threatening and if other safer measures have proved ineffective. A tourniquet is also used routinely to distend veins before venipuncture. See also **hemorrhage.**

Application of a tourniquet to control hemorrhage
(Sanders et al, 2007)

tourniquet infusion method, a technique of intraarterial regional chemotherapy used in the treatment of osteogenic sarcoma. The technique uses one or two external tourniquets, depending on the location of the tumor, that slow or interrupt the blood flow to a limb temporarily while an anticancer drug, such as adriamycin, is infused into the area. The method increases the concentration of an antineoplastic drug by as much as 100 times compared with an alternative technique of injecting the drug into the circulation without application of a tourniquet, which results in rapid dilution of the drug by the normal blood volume.

tourniquet test, a test of capillary fragility, caused by an abnormality in the capillary wall or thrombocytopenia, in which a blood pressure cuff is applied for 5 minutes to a person's arm and inflated to a pressure halfway between the diastolic and systolic blood pressure. The number of petechiae within a circumscribed area of the skin may be counted, or the results may be reported in a range from negative (no petechiae) to +4 positive (confluent petechiae).

tower head, tower skull. See **oxycephaly.**

Townes method, a technique for producing radiographic images of the occipital bone, foramen magnum, and dorsum sellae. The patient is supine or facing the x-ray tube with the chin depressed so the orbitomeatal line is perpendicular. The x-ray beam is angled 30 degrees toward the patient's feet and enters the frontal bone above the nasal bones and exits the occipital bone. See also **Haas method.**

tox-, toxi-, toxico-, toxo-, prefix meaning "toxins or poisons": *toxin, toxicology*.

-toxaemia. See **-toxemia.**

toxaemia. See **toxemia.**

Toxascaris leonina /toksas′kəris/, a species of nematode found mainly in domestic animals, commonly known as roundworms. It differs from related species in that it spends its entire developmental cycle in the digestive tract, rather than migrating through the lungs.

toxemia /toksē′mē·ə/ [Gk, *toxikon,* poison, *haima,* blood], the presence of bacterial toxins in the bloodstream. Also spelled **toxaemia.** Also called **septicemia.** See also **preeclampsia.** **—toxemic,** *adj*.

-toxemia, -toxaemia, suffix meaning a "(specified) toxic substance in the blood": *ectotoxemia, gonotoxemia, ophiotoxemia*.

toxemia of pregnancy. See **preeclampsia.**

toxi-. See **tox-.**

-toxia, combining form meaning "condition resulting from a poison in a (specified) region of the body": *neurotoxia, thyrotoxia, urotoxia*.

toxic /tok′sik/ [Gk, *toxikon*], **1.** pertaining to a poison. **2.** pertaining to a severe and progressive disease or condition.

-toxic, -toxical, suffix meaning "poison": *cardiotoxic, hematoxic, spermatoxic*.

toxic albuminuria [Gk, *toxikon,* poison; L, *albus,* white; Gk, *ouron,* urine], a condition of serum albumin in the urine caused by the presence of toxic substances in the body.

toxic alcohols, poisonous alcohols that can damage the heart, kidneys, and nervous system. Ethylene glycol, commonly used in antifreeze, is a toxic alcohol. Severe poisoning is caused only by ingestion and is marked by progressive stages of central nervous system depression, acidosis, and renal failure. Treatment consists of administration of an antidote, hemodialysis, and supportive care.

toxic allergic syndrome. See **Löffler's syndrome, PIE.**

toxic amblyopia, partial loss of vision because of retrooptic bulbar neuritis resulting from poisoning with quinine, lead, wood alcohol, nicotine, arsenic, or certain other poisons.

toxicant /tok′sikənt/, any poisonous agent.

toxic deafness. See **ototoxic hearing loss.**

toxic delirium [Gk, *toxikon,* poison; L, *delirare,* to rave], a symptom of disordered mental status as a result of poisoning.

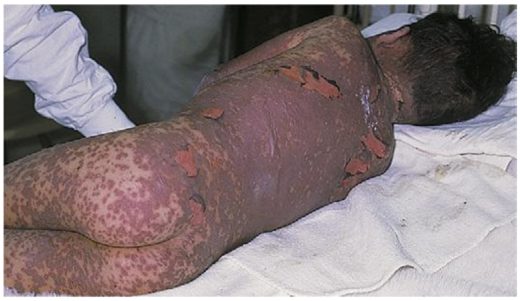
toxic dementia, dementia resulting from excessive use of or exposure to a poisonous substance. See also **dementia.**

toxic dilation of colon [Gk, *toxikon* + L, *dilatare,* to widen; Gk, *kolon*], a condition of transverse colon dilation as a complication of amebic colitis, ulcerative colitis, or other bowel disease. Symptoms may include cramping, fever, rapid heartbeat, and mental confusion.

toxic dose (TD), (in toxicology) the amount of a substance that may be expected to produce a toxic effect. See also **median toxic dose.**

toxic encephalitis [Gk, *toxikon,* poison, *enkephalos,* brain, *itis,* inflammation], encephalitis caused by heavy metal poisoning. It is characterized by convulsions and cerebral edema.

toxic epidermal necrolysis (TEN), a rare life-threatening skin disease characterized by epidermal erythema, superficial necrosis, and skin erosions. This condition, which affects mainly adults, makes the skin appear scalded, often leaving scars. The cause of TEN is unknown, but it may result from toxic or hypersensitive reactions, an immune response, or severe physiological stress. A similar skin disorder may be the result of a staphylococcal infection. Treatment of TEN commonly involves the administration of IV fluids to replace body fluids and maintain electrolyte balance. Frequent laboratory analyses are necessary to monitor hematocrit and hemoglobin, serum proteins, electrolytes, and blood gases. Also called **scalded skin syndrome.** Compare **staphylococcal scalded skin syndrome.**



Toxic epidermal necrolysis

(White and Cox, 2006/Courtesy Dr. O. Dale Collins III)

toxic erythema [Gk, *toxikon,* poison, *erythema,* redness], an inexact term sometimes applied to reddish skin eruptions of undetermined origin.

toxic erythema of the newborn. See **erythema neonatorum.**

toxic gastritis. See **corrosive gastritis.**

toxic goiter, an enlargement of the thyroid gland associated with exophthalmia and systemic disease. See also **Graves' disease, thyroiditis.**

toxic headache, headache caused by systemic poisoning or associated with illness.

toxic hemoglobinuria. See **hemoglobinuria.**

toxic hepatitis, hepatitis produced by a hepatotoxin, such as *Amanita phalloides* toxin; carbon tetrachloride; or any of various drugs.

toxic hepatopathy, liver disease produced by a hepatotoxin such as *Amanita phalloides toxin;* carbon tetrachloride; white phosphorus; or any of various drugs. It can range in severity from subclinical abnormalities to jaundice to fulminant liver failure.

toxicity /toksis′itē/ [Gk, *toxikon*], **1.** the degree to which something is poisonous. **2.** a condition that results from exposure to a toxin or to toxic amounts of a substance that does not cause adverse effects in smaller amounts.

toxic nephropathy, kidney damage caused by the effects of a nephrotoxin. The most common symptoms are dysfunction and then necrosis of the proximal tubules, sometimes progressing to renal failure.

toxic neuritis [Gk, *toxikon,* poison, *neuron,* nerve, *itis,* inflammation], a painful nerve inflammation caused by a metallic, bacterial, or other poison.

toxic nodular goiter, an enlarged thyroid gland characterized by numerous discrete nodules and hypersecretion of thyroid hormones. It occurs most frequently in elderly individuals. Typical signs of thyrotoxicosis such as nervousness, tremor, weakness, fatigue, weight loss, and irritability are usually present, but exophthalmia is rare. Anorexia is more common than hyperphagia, and cardiac arrhythmia or congestive heart failure may be a predominant manifestation. When clinical findings suggest thyrotoxicosis, a therapeutic trial of antithyroid drugs, such as propylthiouracil or methimazol, is indicated, but, after the diagnosis is established, radioactive iodine is considered the treatment of choice, and large doses are usually required.

toxico-. See **tox-.**

Toxicodendron /tok′sikōden′dron/, a genus of plants that includes poison ivy, poison oak, and poison sumac. The toxic agent in the plants is a nonvolatile oil, toxicodendrol. See also **rhus dermatitis.**

toxicokinetics /tok′sikō′kinet′iks/, the passage through the body of a toxic agent or its metabolites, usually in an action similar to that of pharmacokinetics.

toxicologic, toxicological, pertaining to poisons. See **toxicology.**

toxicologist /tok′sikol′əjist/, a specialist in poisons, their effects, and antidotes.

toxicology /-ol′əjē/, the scientific study of poisons, their detection, their effects, and methods of treatment for conditions they produce. **—toxicologic, toxicological,** *adj.*

toxicology screening, a blood or urine test that detects the most commonly abused nonprescription drugs. Testing for drug overdose and poisoning is best done on blood, whereas screening for use or abuse of nonprescription drugs is usually done on urine. Toxicology studies are used to implicate drugs as a cause or factor in the death of a person.

toxic or drug-induced hepatitis, hepatitis resulting from a chemical, parasitic, or metabolic poison.

toxicosis /tok′sikō′sis/ [Gk, *toxikon,* poison, *osis,* condition], a disease condition caused by the absorption of metabolic or bacterial poisons.

toxic psychosis, psychosis that results from the poisonous effects of chemicals or drugs, including those produced by the body itself.

toxic shock syndrome (TSS), a severe acute disease caused by infection with strains of *Staphylococcus aureus,* phage group I, that produces a unique toxin, enterotoxin F. It is most common in menstruating women using high-absorbency tampons but has been seen in newborns, children, and men.

■ OBSERVATIONS: The onset of the syndrome is characterized by sudden high fever, headache, sore throat with swelling of the mucous membranes, diarrhea, nausea, and erythroderma. Acute renal failure, abnormal liver function, confusion, and refractory hypotension usually follow, and death may occur. It is probable that mild forms of the syndrome are not reported and therefore are not diagnosed. No seasonal or geographic factor appears involved in the cause of the disease, and there is no evidence of contagion among household members or through sexual contacts of people who have TSS. Bacteremia, or discernible local infection, is absent in most cases. *S. aureus* may be cultured from many sites, including the pharynx, nares, and cervix, but the drastic effects of infection are the result of the toxin released from the organism rather than from the infection itself.

■ INTERVENTIONS: Aggressive volume expansion by the administration of large amounts of IV fluids, assisted ventilation, and administration of vasopressors may be necessary in treating severe TSS. Early recognition and active supportive treatment greatly improve the survival rates and decrease both prolonged morbidity and recurrence.

toxic substance [Gk, *toxikon,* poison; L, *substantia,* essence], any poison.

toxidrome /tok′s-drōm/, a specific syndromelike group of symptoms associated with exposure to a given poison.

toxidromes, signs and symptoms of toxicity consistently associated with classes of medications.

toxin /tok′sin/, a poison, usually one produced by or occurring in a plant or microorganism. See also **endotoxin, exotoxin.**

-toxin, combining form meaning "poison": *cynotoxin, hypnotoxin, zootoxin.*

toxin-antitoxin [Gk, *toxikon,* poison, *anti,* against, *toxikon*], a mixture of toxin and antitoxin. Diphtheria toxin-antitoxin was formerly used for active immunization.

toxinology /tok′sinol′əjē/, the study of poisons, with particular emphasis on relatively unstable proteinaceous substances. See also **toxicology.**

toxo-. See **tox-.**

Toxocara /tok′səker′ə/, a genus of ascarid nematodes. *T. canis* affects mainly dogs. *T. mystax* affects cats but may also infect humans, particularly children, causing intestinal and respiratory symptoms and damage to the spleen and liver. See also **toxocariasis.**

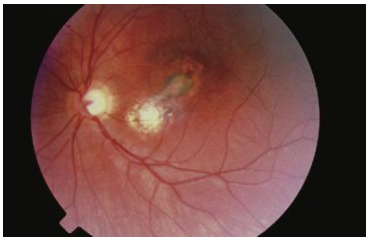
toxocariasis /tok′sōkərī′əsis/ [Gk, *toxo,* bow, *kara,* head, *osis,* condition], infection with the larvae of *Toxocara canis,* the common roundworm of dogs, and with *T. cati,* of cats. Human ingestion of viable eggs, commonly found in soil, leads to the spread of tiny larvae throughout the body, resulting in respiratory symptoms, enlarged liver, skin rashes, eosinophilia, and delayed ocular lesions. Children who eat dirt are particularly subject to this disease. Specific drug therapy is not very useful; the outcome is usually good without therapy. Two major forms of the infection exist: ocular larval migrans (OLM), which can cause an eye disease resulting in blindness, occurs when the worm enters the eye. Visceral larval migrans (VLM) is heavy or repeated infection that causes swelling of organs or the central nervous system. Symptoms of this form are caused by movement of the worms and are manifested as fever, asthma, or pneumonia. Severe forms are rare, VLM is treated with antiparasitic drugs and antiinflamatories, OLM is more difficult to treat and usually involves preventing progression of eye damage. Regular worming of pets helps prevent infection. Also called *visceral larval migrans.*

toxoid /tok′soid/ [Gk, *toxikon,* poison, *eidos,* form], a toxin that has been treated with chemicals or heat to decrease its toxic effect but that retains its antigenic power. It is given to produce immunity by stimulating the creation of antibodies. See also **toxin, vaccine.**

toxophore /tok′səfôr′/, the part of a toxic molecule that is responsible for the poisonous effect.

Toxoplasma /tok′sōplaz′mə/ [Gk, *toxikon* + *plasma,* something formed], a genus of protozoa with only one known species, *T. gondii,* an intracellular parasite of cats and other hosts that causes toxoplasmosis in humans.

toxoplasmosis /tok′sōplazmō′sis/ [Gk, *toxikon* + *plasma* + *osis,* condition], a common infection with the protozoan intracellular parasite *Toxoplasma gondii.* The congenital form is characterized by liver and brain involvement with cerebral calcification, convulsions, blindness, microcephaly or hydrocephaly, and mental retardation. The acquired form is characterized by rash, lymphadenopathy, fever, malaise, central nervous system disorders, myocarditis, and pneumonitis.



Congenital toxoplasmosis: retinal changes
(Conlon and Snydman, 2000)

■ OBSERVATIONS: Cats acquire the organism by eating infected birds and mice. Cysts of the organism are transmitted from cat feces to humans or by human ingestion of inadequately cooked meat containing the cysts. Transplacental transmission occurs only during acute infection of the mother, but the disease is very serious in the fetus and in those with human immunodeficiency virus or other immunosuppressive conditions or impaired immune system. Diagnosis is made by demonstrating rising antibody titers or by immunofluorescent antibody tests. Infection confers immunity.

■ INTERVENTIONS: Combinations of sulfonamides with pyrimethamine are recommended as treatment, possibly reducing the severity of the illness in the fetus.

■ NURSING CONSIDERATIONS: All meat should be heated to at least 140° F (60° C) throughout to kill this parasite. Pregnant women who are not immune are advised not to handle cats, cat feces, or litter boxes.

toxoplasmosis antibody titer, a blood test performed on pregnant women to detect toxoplasmosis infection, which is associated with recognized detrimental effects on the fetus. See also **TORCH syndrome.**

Toynbee maneuver /toin′bē/ [Joseph Toynbee, English otologist, 1815–1866], pinching the nostrils and swallowing. If the auditory tube is patent, the tympanic membrane will retract medially.

Toynbee test /toin′bē/ [Joseph Toynbee], performance of the Toynbee maneuver (q.v.) and monitoring of pressure changes in the middle ear. Subsequent middle ear negative pressure or negative pressure followed by ambient pressure usually indicates normal function of the auditory tube.

TPA, abbreviation for **tissue plasminogen activator.**

TPAL. See **parity.**

TPHA, abbreviation for *Treponema pallidum hemagglutination assay.*

TPN, abbreviation for **total parenteral nutrition.**

TPR, abbreviation for *temperature, pulse, respiration*.

TQ, symbol for **tocopherolquinone.**

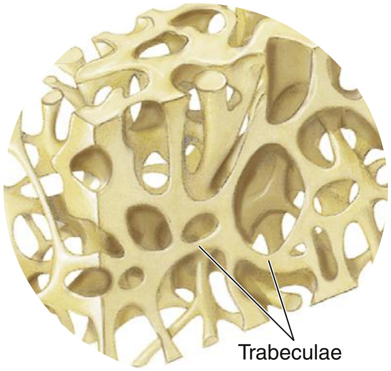
TQM, abbreviation for **total quality management.**

TR, **1.** abbreviation for **repetition time.** **2.** abbreviation for **tricuspid regurgitation.**

trabecula carnea /trəbek′yələ/ *pl.* **trabeculae carneae** [L, little beam, *carneus,* flesh], any one of the irregular bands and bundles of muscle projecting from the inner surfaces near the apex of the ventricles of the heart. Also called **Rathke's bundles.** Compare **chordae tendineae.** See also **heart, left ventricle, right ventricle.**

trabeculae, (in ophthalmology) the part of the eye in front of the canal of Schlemm and within the angle created by the iris and the cornea, responsible for aqueous drainage.

trabecular pattern /trəbek′yələr/ [L, little beam], an irregular meshwork of stress and stress-related struts within a cancellous bone.



Trabecular pattern *(Patton and Thibodeau, 2010)*

trabecula septomarginalis. See **moderator band.**

trabeculated bladder, a noncompliant, hypotonic bladder resulting from hypertrophy of the muscular coat, usually caused by obstruction of the urethra. Increasing postvoid residuals and risk of urinary tract infection may ensue.

trabeculectomy, creation of a fistula between the anterior chamber of the eye and the subconjunctival space by surgical removal of a portion of the trabecular meshwork, performed to facilitate drainage of the aqueous humor in glaucoma.

trabeculoplasty /trabek′yəlōplas′tē/, a plastic surgery procedure used in the treatment of open-angle glaucoma. An argon laser beam is used to blanch the trabecular network of the eye, thereby permitting drainage of the excess fluid that is causing increased pressure within the eyeball.

trabeculotomy /-ot′əmē/, a surgical opening in an orbital trabecula to increase the outflow of aqueous humor.

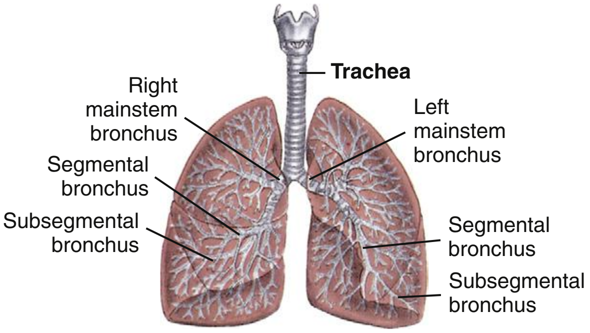
trace element [L, *trahere,* to draw, *elementum,* first principle], an element essential to nutrition or physiological processes, found in such minute quantities that analysis yields a presence of only trace amounts.

trace gas, any gas that represents an extremely small or insignificant portion of a mixture of gases. See also **gas-scavenging system.**

tracer [L, *trahere,* to draw], **1.** a radioactive isotope that is used in diagnostic x-ray techniques to allow a biological process to be seen. After introduction into the body, the tracer binds with a specific substance and is followed with a scanner or fluoroscope as it passes through various organs or systems. Kinds of tracers include **radioactive iodine** and **radioactive carbon.** See also **radioisotope scan.** **2.** a mechanical device that graphically records the outline or movements of an object or part of the body. **3.** a dissecting instrument that is used to isolate vessels and nerves. **—trace,** *v.*

tracer depot method, a technique used to determine local blood flow through skin or muscle, based on the rate at which a radioactive tracer deposited in a tissue is removed by diffusion into the capillaries and washed out by the local blood supply. If blood flow is diminished or absent, as in dead skin, the deposited tracer does not wash out.

trachea /trā′kē·ə/ [Gk, *tracheia,* rough artery], a nearly cylindric tube in the neck, composed of C-shaped cartilage and membrane and trachealis muscle, that extends from the larynx at the level of the sixth cervical vertebra to the fifth thoracic vertebra, where it divides into two bronchi. The trachea conveys air to the lungs. It is about 11 cm long and 2 cm wide. The ventral surface of the tube is covered in the neck by the isthmus of the thyroid gland and various other structures, such as the sternothyroideus and the sternohyoideus. Dorsally the trachea is in contact with the esophagus. Also called **windpipe.** See also **primary bronchus.** **—tracheal,** *adj*.



Trachea *(Wilson and Giddens, 2009)*

tracheal /trā′kē·əl/ [Gk, *tracheia,* rough artery], pertaining to the trachea.

tracheal breath sound. See **bronchial breath sound.**

tracheal gas insufflation, continuous insufflation of a low flow of fresh gas to the distal endotracheal tube, believed capable of flushing out the anatomical dead space and thus reducing $PaCO_2$.

tracheal intubation. See **endotracheal intubation.**

tracheal tugging [Gk, *tracheia,* rough artery; ME, *toggen*], an effect of an aortic aneurysm in which the trachea is pulled downward with each heart contraction.

tracheitis /trā′kē·ī′tis/, any inflammatory condition of the trachea. It may be acute or chronic, resulting from infection, allergy, or physical irritation. Also called **trachitis.**

trachelagra, distortion of the muscles of the neck.

trachelo-, prefix meaning “neck or necklike structure”: *trachelobregmatic, trachelocystitis, tracheloschisis*.

trachelodynia. See **cervicodynia.**

tracheo- /trā′kē·ō-/, prefix meaning “trachea”: *tracheobronchial, tracheomalacia, tracheorrhaphy*.

tracheobronchial /trā′kē·ō·brong′kē·əl/, pertaining to the trachea and bronchi. Also called **bronchotracheal.**

tracheobronchial tree (TBT) /-brong′kē·əl/ [Gk, *tracheia* + *bronchos*, windpipe], an anatomical complex that includes the trachea, bronchi, and bronchial tubes. It conveys air to and from the lungs and is a primary structure in respiration. See also **bronchial tree.**

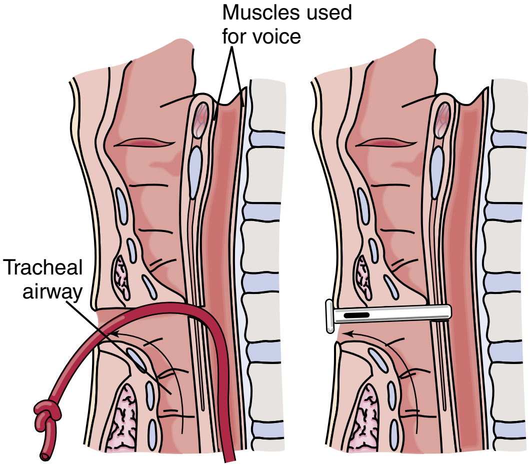
tracheobronchitis /trā′kē·ōbrongkī′tis/, inflammation of the trachea and bronchi, a common symptom of pulmonary infection.

tracheobronchomegaly /-brong′kōmeg′əlē/, an abnormally large upper airway, in which the trachea may be as wide as the spinal column.

tracheoesophageal fistula /trā′kē·ō·ē′səfā′jē·əl/ [Gk, *tracheia* + *oisophagos*, gullet], a congenital malformation in which there is an abnormal tubelike passage between the trachea and the esophagus. Also spelled **tracheooesophageal fistula.**

tracheoesophageal folds, longitudinal folds in the embryonic respiratory diverticulum that fuse to form the tracheoesophageal septum.

tracheoesophageal puncture (TEP), a one-way synthetic valve placed in a surgically created tracheoesophageal fistula to restore speech after laryngectomy.



Tracheoesophageal puncture
(Monahan et al, 2007)

tracheoesophageal shunt, surgical formation of a passageway between the trachea and the esophagus that enables a laryngectomee to speak. The operation results in an ability to produce esophageal speech with normal respiration as a source of air and without the need to belch to produce voice sounds. Also spelled **tracheooesophageal shunt.**

tracheolaryngeal /-lerin′jē·əl/, pertaining to the trachea and larynx.

tracheomalacia /trā′kē·ōməlā′shə/, an eroding of the trachea that is usually caused by excessive pressure from a cuffed endotracheal tube but that can be congenital.

tracheooesophageal fistula. See **tracheoesophageal fistula.**

tracheooesophageal shunt. See **tracheoesophageal shunt.**

tracheopharyngeal /-ferin′jē·əl/, pertaining to the trachea and pharynx.

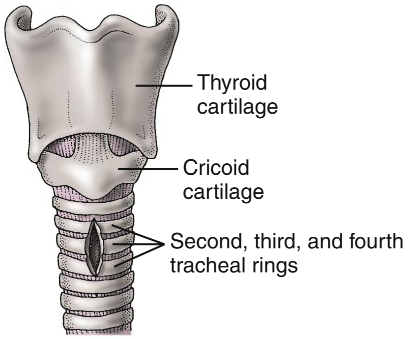
tracheoplasty /trā′kē·ōplas′tē/, plastic surgery of the trachea.

tracheostenosis /-stənō′sis/, constriction of the lumen of the trachea.

tracheostomy /trā′kē·os′təmē/ [Gk, *tracheia* + *stoma*, mouth], an opening through the neck into the trachea through which an indwelling tube may be inserted. After tracheostomy the patient’s chest is auscultated for breath sounds indicative of bilateral air exchange and pulmonary congestion, mucous membranes and fingertips are observed for cyanosis, oxygenation is monitored with pulse oximeters, and humidified oxygen is given via a trach collar placed over the tracheostomy tube. The patient is reassured that the tube is open and that air can pass through it. The tube is suctioned as needed to keep it free from tracheobronchial secretions by using a suction catheter attached to a Y-connector. The catheter is rotated, and intermittent suction is applied for no longer than 10 seconds. Complications of tracheostomy include pneumothorax, respiratory insufficiency, obstruction of the tracheostomy tube or its displacement from the lumen of the trachea, pulmonary infection, atelectasis, tracheoesophageal fistula, hemorrhage, and mediastinal emphysema. If the procedure was done as an emergency, the tracheostomy is closed after normal breathing is restored. If the tracheostomy is permanent, such as with a laryngectomy, the patient is taught self-care. Compare **tracheotomy.**

tracheostomy care [Gk, *tracheia*, rough artery, *stoma*, mouth], care of the tracheostomy patient, consisting of maintenance of a patent airway, adequate humidification, aseptic wound care, and sterile tracheal aspiration. Complications can include injury to the vocal cords, gastric distension and regurgitation, occlusion of the endotracheal tube, and an increased risk of infection.

tracheotomy /trā′kē·ot′əmē/ [Gk, *tracheia* + *temnein*, to cut], an incision made into the trachea through the neck below the larynx, performed to gain access to the airway below a blockage with a foreign body, tumor, or edema of the glottis. The opening may be made as an emergency measure at an accident site, at a hospitalized patient’s bedside, or in the operating room. The patient’s neck is hyperextended, and an incision is made through the skin and through the second, third, or fourth tracheal ring. A small hole is made in the fibrous tissue of the trachea, and the opening is then dilated to allow air intake. In an emergency any available instrument may be used as a dilator, even the barrel of a ballpoint pen with the inner part removed. If the blockage persists, a tracheostomy tube is inserted; if not, the incision is closed after normal respirations are established. After surgery the patient is observed for recurrent respiratory difficulty or cyanosis. Compare **tracheostomy.**

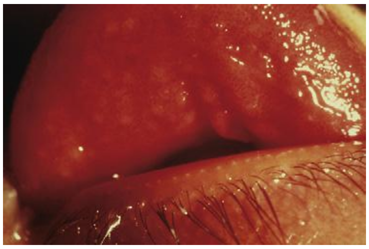


Tracheotomy *(Ignatavicius and Workman, 2010)*

tracheotomy tube [Gk, *tracheia,* rough artery, *temnein,* to cut; L, *tubus*], a curved hollow tube of rubber, metal, or plastic surgically inserted in the trachea to relieve a breathing obstruction.

trachitis. See **tracheitis.**

trachoma /trəkō′mə/ [Gk, roughness], a chronic infectious disease of the eye caused by the bacterium *Chlamydia trachomatis*. It is characterized initially by inflammation, pain, photophobia, and lacrimation. If untreated, follicles form on the upper eyelids, forming scarring that causes trichiasis and corneal sequelae, eventually causing blindness. Tetracycline, erythromycin, and azithromycin usually provide effective treatment. Scarred eyelids may be surgically repaired. Trachoma is a significant cause of blindness and is endemic to hot, dry, poverty-ridden areas. In the United States it is found in the Southwest. Teaching an affected population about the spread of trachoma and having an adequate water supply for washing hands, towels, and handkerchiefs are important factors in eliminating the disease. Also called **Egyptian ophthalmia, granular conjunctivitis.**



Trachoma *(Conlon and Snydman, 2000)*

tracing [L, *trahere,* to draw], a graphic record of a physical event, such as an electrocardiograph tracing made by pens on a moving sheet of paper while the electric impulses of heart muscle contractions are recorded.

trackball, a type of computer peripheral that is larger than a typical mouse having one large ball to use to move the cursor and two large buttons for click commands.

tract [L, *tractus,* trail], **1.** an elongated group of tissues and organs that function together as a pathway, such as the digestive tract or the respiratory tract. **2.** (in neurology) the neuronal axons that are grouped together to form a pathway; a serial arrangement that serves a common function.

traction /trak′shən/ [L, *trahere,* to draw], **1.** (in orthopedics) the process of putting a limb, bone, or group of muscles under tension by means of weights and pulleys to align or immobilize the part to reduce muscle spasm or relieve pressure on it. Kinds of traction include **Bryant's traction, Buck's traction, Russell's traction, skeletal traction, skin traction,** and **split Russell traction.** See also **orthopedic traction. 2.** the process of pulling a part of the body along, through, or out of its socket or cavity, such as axis traction with obstetric forceps in delivering an infant.

traction, 90-90, an orthopedic mechanism, used especially in pediatrics, that combines skeletal traction and suspension with a short-leg cast or a splint to immobilize and position the lower extremity in the treatment of a displaced fractured femur. This type of traction is usually unilateral with the opposite leg in Buck's traction or in split Russell traction for immobilization. The pin used in this kind of skeletal traction is inserted into bone in the knee area and attached to a riser running through a pulley on an overhead traction frame to a pulley and weight system fitted over the foot of the bed. The pulley and weight system at the foot of the bed also accommodates additional attachments to the short-leg cast or splint of the involved lower limb. Application of 90-90 traction may also incorporate a jacket restraint to help immobilize the patient. A variation of this type of traction is often used with adults in the treatment of low back pain.

traction frame, an orthopedic apparatus that supports the pulleys, ropes, and weights by which traction is applied to various parts of the body or by which various parts of the body are suspended. Traction frames are used in the treatment of bone fractures, dislocations, and disease processes of the musculoskeletal system; in the correction of various orthopedic deformities; and in the general immobilization of specific areas of the body. The main components of a traction frame are metal uprights that attach to the bed and support an overhead metal bar. In addition to having traction equipment, traction frames are often rigged with trapeze bars that the patient can grasp to help in changing positions and to exercise the muscles of the arms and the trunk. The components of a traction frame are securely clamped together when in use but can be easily disassembled and reassembled. Compare **Balkan traction frame, claw-type traction frame, IV-type traction frame.**

traction/immobilization care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient who has traction and/or a stabilizing device to immobilize and stabilize a body part. See also **Nursing Interventions Classification.**

traction response, the body's reaction to traction applied to the spine. Alterations of certain signs and symptoms of a musculoskeletal disorder may be revealed by traction tests. For example, if traction relieves a symptom, it may indicate impingement of a nerve root. Traction also may be used therapeutically to increase joint range, overcome muscle spasms, shorten soft tissues, or neutralize pressure and relieve pain in various joints.

trademark, a word, symbol, or device assigned to a product by its manufacturer, registered or not registered, as a part of its identity. See also **generic name.**

traditional Chinese medicine (TCM), the diverse body of medical theory and practice that has evolved in China, comprising four branches: acupuncture and moxibustion, herbal medicine, qi gong, and tui na. Although TCM encompasses a variety of theory and practice, all of its forms share certain underlying characteristics. The body and mind are considered together as a dynamic system subject to cycles of change and affected by the environment, and emphasis is on supporting the body's self-healing ability. Fundamental to TCM are the yin-yang principle and the concept of basic substances that pervade the body: qi, jing (essence), and shen (spirit), collectively known as the three treasures, and the blood (a fluid and material manifestation of qi) and body fluids (which moisten and lubricate the body). Disease arises from a disturbance of qi within the body, the particular pathological process depending on the location of the disturbance; causes are classified into three groups, external (which are environmental), internal (emotions), and miscellaneous (such as diet, fatigue, or trauma). Diagnosis is by visual assessment, listening and smelling, questioning, and palpation; a single biomedical disease may be associated with a large number of TCM diagnoses, and one TCM diagnosis may encompass a number of biomedical diseases. Once a diagnosis is established, therapy aims at restoring the body's homeostasis by treating the root cause of the disease.

tragacanth /trag′əkanth/, a white tasteless vegetable gum derived from a shrub, *Astragalus gummifer,* and related species. It is used as a suspending agent in pharmaceutic preparations, particularly powders and tinctures.

tragal /trā′gəl/ [Gk, *tragos,* goat], pertaining to the tragus. tragophony. See also **egophony.**

Trager approach, service mark for a bodywork technique whose purpose is to train patients to develop awareness of movement patterns that relieve pain and promote relaxation. It consists of two components: tablework, in which the practitioner, in a meditative state, uses touch and gentle passive movement to assist the patient in experiencing new movement patterns, and Mentastics, in which the patient is taught a series of movements designed to relieve tension.

tragi, projections external to the ear. See **tragus.**

tragion /traj′ēən/ [Gk, *tragos,* goat], a cephalometric landmark located at the superior margin of the tragus of the ear.

tragophony, voice with a high-pitched or bleating quality. See **egophony.**

tragus /trā′gəs/ *pl.* **tragi** [Gk, *tragos,* goat], a small tongue-like projection of the auricular cartilage of the ear, anterior to the external meatus.

trained reflex. See **conditioned response.**

traineeship /trānē′ship/ [L, *trahere,* to draw; AS, *scieppan,* to shape], a grant of money allocated to an individual for advanced study in a given field. In nursing many graduate students have been awarded federal traineeships that provide funds for tuition and living expenses.

training effect, a rehabilitation effect in heart patients that can be measured by changes in cardiac function.

training grant, a grant of money or other resources to provide training in a particular field. Many schools of nursing receive federal or state grants to provide specific educational programs. Funds may be allocated for faculty salaries, student aid, or other expenses.

train-of-four, a test for measuring the level of neuromuscular blockade. Four consecutive stimuli are delivered along the path of a nerve, and the response of the muscle is measured in order to evaluate stimuli that are blocked versus those that are delivered. Four equal muscle contractions will result if there is no neuromuscular blockade, but, if nondepolarizing blockade is present, there will be a loss of twitch height and number, which will indicate the degree of blockade. This test is commonly used in intensive care units.

trait [Fr, trace], **1.** a characteristic mode of behavior or any mannerism or physical feature that distinguishes one individual or culture from another. **2.** any characteristic quality or condition that is genetically determined and inherited as part of a specific phenotype. A trait is inherited as homozygous dominant, homozygous recessive, or heterozygous in the ratio of 1:2:1 among offspring of two heterozygous parents. In medicine the term *trait* is used specifically to denote the heterozygous state of a recessive disorder, such as the sickle cell amemia. See also **dominance, gene, Mendel's laws, recessive allele.**

TRALI, abbreviation for **transfusion-related acute lung injury.**

tramadol, a central analgesic.

■ INDICATIONS: It is used to manage moderate to severe pain.

■ CONTRAINDICATIONS: Factors that prohibit its use are known hypersensitivity to this drug or acute intoxication with any central nervous system depressant.

■ ADVERSE EFFECTS: Seizures and GI bleeding are life-threatening effects. Other adverse effects are dizziness, central nervous system stimulation, somnolence, headache, anxiety, confusion, euphoria, hallucination, nausea, constipation, vomiting, dry mouth, diarrhea, abdominal pain, anorexia, flatulence, vasodilation, orthostatic hypotension, tachycardia, hypertension, abnormal electrocardiograms, pruritus, rash, urticaria, vesicles, urinary retention or frequency, menopausal symptoms, dysuria, and menstrual disorders.

TRAM flap, an autogenous myocutaneous flap that uses transverse rectus abdominal muscle (TRAM) to carry lower abdominal skin and fat to the breast for reconstruction. See also **myocutaneous flap.**

trance [L, *transire,* to pass across], **1.** a sleeplike state characterized by the complete or partial suspension of consciousness and loss or diminution of motor activity, as seen in hypnosis, dissociative disorders, and various cataleptic and ecstatic states. **2.** a dazed or bewildered condition; stupor. **3.** a state of detachment from one's immediate surroundings, such as in deep concentration or daydreaming. Kinds of trances are **alcoholic trance, death trance, hypnotic trance,** and **induced trance.**

Trandate, a trademark for an antihypertensive drug **(labetalol hydrochloride).**

trandolapril, an antihypertensive. Its prototype is enalapril.

■ INDICATIONS: It is used to treat hypertension, heart failure, and postmyocardial infarction/left ventricular dysfunction.

■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity, a history of angioedema, and second- or third-trimester pregnancy.

■ ADVERSE EFFECTS: Life-threatening effects include myocardial infarction, stroke, agranulocytosis, neutropenia, leukopenia, anemia, proteinuria, and renal failure. Other adverse effects include palpitations, angina, transient ischemic attacks, bradycardia, arrhythmias, paresthesias, headache, fatigue, drowsiness, depression, sleep disturbances, nausea, vomiting, cramps, diarrhea, constipation, ileus, pancreatitis, hepatitis, rash, purpura, dyspnea, hyperkalemia, hyponatremia, and impotence. Common side effects include hypotension, dizziness, dyspepsia, cough, and myalgia.

tranexamic acid /tran′ek-sam′ik/, an agent that combats fibrinolysis by competitively inhibiting activation of plasminogen. It is used in prophylaxis and treatment of hemorrhage associated with excessive fibrinolysis, such as that after oral surgery in patients with hemophilia. It is administered orally or intravenously.

tranquilizer /trang′kwilī′zər/ [L, *tranquillus,* calm], a drug prescribed to calm anxious or agitated people, ideally without decreasing their consciousness. Major tranquilizers are generally used in the treatment of psychoses and are now generally referred to as antipsychotic drugs. Minor tranquilizers are usually prescribed for the treatment of anxiety, irritability, tension, or psychoneurosis and are now generally referred to as antianxiety drugs or sedative-hypnotics. Tranquilizers tend to induce drowsiness and have the potential for causing physical and psychological dependence. Also spelled *tranquillizer.* See also **antipsychotic.**

trans- /trans-, tranz-/, prefix meaning "across, through, over": *transabdominal, transferase, transplacental.*

transabdominal /-abdom′inəl/ [L, *trans,* across, *abdomen,* belly], pertaining to a procedure through the abdominal wall.

transactional analysis (TA) /-ak′shənəl/ [L, *transigere,* to drive through; Gk, *analyein,* to loosen], a form of psychodynamic psychotherapy developed by Eric Berne, based on a role theory that three different coherent organized egos exist throughout life simultaneously in every person, representing the child, the adult, and the parent. Interactions between people are transactions, originating from a person in one of the ego states, and received by another person who may be in a complementary or a crossed ego state. Transactions are motivated by a need for recognition and contact called "strokes." Transactions occur in six kinds of "time structure": withdrawal, rituals, pastimes, games, activities, and intimacy.

The way in which a person structures time reflects internal conflicts and patterns adopted to cope with those conflicts. The goal of transactional analysis is to enable clients to communicate from the ego state appropriate to the situation and the responses of the individuals, thereby decreasing conflict.

transaminase. See **aminotransferase.**

transamination[1] /-am′inā′shən/, the reaction between an amino acid and an alpha-keto acid in which the enzyme transaminase induces transfer of the amino group to the alpha-ketoacid.

transaortic /-ā·ôr′tik/ [L, *trans,* across; Gk, *aerein,* to raise], through the aorta.

trans arrangement. See **trans configuration.**

transcellular transport, transport of molecules through the cells of an epithelial cell layer.

transcellular water /-sel′yələr/ [L, *trans* + *cella,* storeroom], the part of extracellular water that is enclosed by an epithelial membrane and whose volume and composition are determined by the cellular activity of that membrane.

transcendence /transen′dəns/ [L, *trans* + *scandere,* to climb], the rising above one's previously perceived limits or restrictions.

transcendental meditation (TM), a psychophysiological exercise designed to lower levels of tension and anxiety and increase tolerance of frustration. TM has been described as a state of consciousness that does not require any physical or mental control. During meditation, the person enters a hypometabolic state in which there is reduced activity of the adrenergic component of the autonomic nervous system.

transcervical fracture /transur′vikəl/ [L, *trans,* across, *cervix,* neck, *fractura*], a fracture through the neck of the femur.

transcondylar fracture /transkon′dilər/ [L, *trans* + Gk, *kondylos,* condyle], a fracture that occurs transversely and distally to the epicondyles of any one of the long bones.

trans configuration /-kənfig′yərā′shən/ [L, *trans* + *configurare,* to form from], **1.** an arrangement in which the dominant allele of one pair of genes and the recessive allele of another pair are on the same chromosome. **2.** an arrangement in which at least one mutant gene and one wild-type gene of a pair of pseudoalleles are present on each chromosome of a homologous pair. Also called **trans arrangement, trans position.** Compare **cis configuration. 3.** in chemistry, a form of geometric isomerism in which two substituent groups occur on opposite sides of a structure such as a ring or a double bond. Also referred to as E (entgegen) configuration. Compare **cis configuration.**

transcortical /trans·kor′ti·kəl/ [L, *trans,* across + *cortex,* bark], connecting two different parts of the cerebral cortex; dependent on disease of the tracts connecting different parts of the cerebral cortex.

transcortical apraxia. See **ideomotor apraxia.**

transcortin /-kôr′tin/, a diglobulin protein that binds a majority of cortisol in the plasma. Also called **corticosteroid-binding globulin.**

transcranial Doppler ultrasonography, a form of Doppler ultrasonography in which pulses of ultrasound are directed at vascular formations in the base of the skull, allowing measurements of blood flow velocity in the major basal intracranial arteries on a real-time basis.

transcriptase /transkrip′tās/, an enzyme that induces transcription.

transcription /transkrip′shən/ [L, *trans* + *scribere,* to write], the process by which messenger RNA is formed from a DNA template. See also **anticodon, genetic code.**

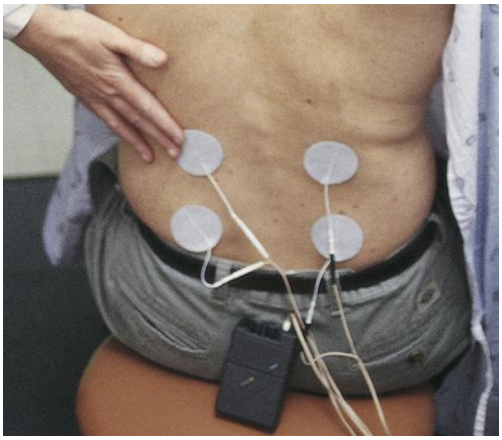
transcription factor, a specific protein required for the initiation of transcription by an RNA polymerase. Each polymerase has its own set of transcription factors.

transcultural nursing /-kul′chərəl/ [L, *trans* + *colere,* to cultivate, *nutrix,* nurse], a field of nursing, founded by Madeleine Leininger, in which the nurse transcends ethnocentricity and practices nursing in other cultural environments. Because current nursing process and theory are not culturally bound and the needs of each person are considered individually, transcultural nursing is a part of all nursing practice.

transcutaneous /-k(y)o͞otā′nē·əs/ [L, *trans* + *cutis,* skin], pertaining to a procedure that is performed through the skin.

transcutaneous electrical nerve stimulation (TENS)[1], a method of pain control by the application of electric impulses to the nerve endings. This is done through electrodes that are placed on the skin and attached to a stimulator by flexible wires. The electric impulses generated are similar to those of the body but different enough to block transmission of pain signals to the brain. TENS is noninvasive and nonaddictive, with no known side effects. It is contraindicated in patients with a demand-type cardiac pacemaker. Also called **transcutaneous nerve stimulation.** See also **galvanic electric stimulation.**

transcutaneous electrical nerve stimulation (TENS) [2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as stimulation of skin and underlying tissues with controlled, low-voltage electrical vibration via electrodes. See also **Nursing Interventions Classification.**



Transcutaneous electrical nerve stimulation

(Ignatavicius and Workman, 2010)

transcutaneous nerve stimulation. See **transcutaneous electrical nerve stimulation.**

transcutaneous oxygen/carbon dioxide monitoring, a method of measuring the oxygen or carbon dioxide in the blood by attaching electrodes to the skin. Oxygen is commonly measured through an oximeter, which contains heating coils to raise the skin temperature and increase blood flow at the surface. Oxygen content is calculated in terms of light absorption at various wavelengths. Transcutaneous carbon dioxide electrodes are similar to blood gas electrodes, with a Teflon membrane tip that is permeable to gases.

transdermal drug delivery (TDD) /-dur′məl/ [L, *trans* + Gk, *derma,* skin], a method of applying a drug to unbroken skin. The drug is absorbed continuously through the skin and enters the systemic system. It is used particularly for the administration of nicotine, nitroglycerin, scopolamine, testosterone, and contraceptives.

NITRO-BID
Nitroglycerin Ointment
NITRO-BID

Transdermal drug delivery
(Perry, Potter, and Elkin, 2012)

transdermal scopolamine, a method of administration of the motion sickness drug scopolamine by application of a skin patch containing the medication.

transducer /-d(y)o͞o′sər/ [L, *trans* + *ducere,* to lead], a hand-held device that sends and receives ultrasound signals. It changes electric impulses into soundwaves, receives reflected soundwaves, and converts them back into electric energy.

transductant /-duk′tənt/, a cell that has acquired a new character by the transfer of genetic material.

transduction /-duk′shən/, a method of genetic recombination by which DNA is transferred from one cell to another by a viral vector. Various bacteriophages transfer DNA from one species of bacteria to another.

transect /transekt′/ [L, *trans* + *secare,* to cut], to sever or cut across, as in preparing a cross section of tissue. See also **transsect, transsection.**

transection. See **transsection.**

transesophageal echocardiography (TEE), an endoscopic/ultrasound test that provides ultrasonic imaging of the heart from a retrocardiac vantage point, thus preventing the interposed subcutaneous tissue, bony thorax, and lungs from interfering with the ultrasound. It is performed to better visualize the mitral valve or atrial septum, to differentiate intracardiac from extracardiac masses and tumors, to diagnose thoracic aortic dissection, to detect valvular vegetation as seen with endocarditis, to determine cardiac sources of arterial embolism, to detect coronary artery disease, and to monitor high-risk patients for ischemia intraoperatively.

trans fats. See ***trans*-fatty acids.**

***trans*-fatty acids,** stereoisomers of the naturally occurring *cis*-fatty acids, found in margarines and shortenings as artifacts after hydrogenation and in commercially baked cakes, cookies, pies, and crackers. A connection has been found between consumption of large amounts of *trans*-fatty acids and increased low-density lipoprotein levels and, thus, increased risk for coronary heart disease. Also called *trans fats*.

transfection /-fek′shən/ [L, *trans* + *inficere,* to taint], the process by which a bacterial cell is infected with purified DNA or RNA isolated from a virus after a specific pretreatment. Acute transfection is short-term infection. **—transfect,** *v*.

transfemoral amputation, amputation of the lower leg between the knee and the hip. Also called **above-knee amputation**, **AK amputation.**

transfer^1**,** to move a person or object from one site to another.

transfer^2**,** a nursing intervention from the Nursing Interventions Classification (NIC) defined as moving a patient with limitation of independent movement. See also **Nursing Interventions Classification.**

transfer agreement /trans′fur/ [L, *transferre,* to carry over, *ad,* toward, *gratus,* pleasure], a written hospital agreement between two health care institutions for the transfer of patients from one to another and the orderly exchange of pertinent clinical information on the patients transferred.

transferase /trans′fərās/ [L, *transferre* + Fr, *diastase,* enzyme], any of a group of enzymes that catalyzes the transfer of a chemical group or radical, such as the phosphate, methyl, amine, or keto groups, from one molecule to another.

transfer DNA (tDNA), DNA transferred from its original source and present in transformed cells.

transference /-fur′əns/ [L, *transferre*], **1.** the shifting of symptoms from one part of the body to another, as occurs in conversion disorder. **2.** (in psychiatry) an unconscious defense mechanism whereby feelings and attitudes originally associated with important people and events in one's early life are attributed to others in current interpersonal situations, including psychotherapy. The phenomenon is used as a tool in understanding the emotional problems of the patient and their origins. See also **countertransference, parataxic distortion.**

transference love, (in psychoanalytic therapy) a projection of libidinal drives expressed by the patient for the psychoanalyst who has "unconsciously" come to represent a person from the patient's past.

transfer factor (TF), a leukocyte extract that transfers delayed hypersensitivity from one person to another. Transfer factor has been studied for its possible use in the treatment of chronic mucocutaneous candidiasis and Wiskott-Aldrich syndrome and as a means of transferring antitumor immunity to patients with various types of cancer.

transfer factor of lungs. See **diffusing capacity of lungs.**

transfer performance, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the ability to change body location independently with or without an assistive device. See also **Nursing Outcomes Classification.**

transferrin /transfer′in/, a plasma protein that is essential in the transport of iron from the intestine into the bloodstream, making it available to the normoblasts in the bone marrow. It also may take part in a slower exchange with ferritin, hemosiderin, and other iron forms in the tissues. See also **hemosiderin, iron transport.**

transferring /-fur′ing/ [L, *trans,* across, *ferre,* to bring], relocating a person in need from one location to another.

transferrin saturation, percentage of iron binding by the major plasma iron transport protein, measured in the blood to detect iron excess or deficiency. The normal transferrin saturation capacity in serum is 20% to 55%. See also **total iron.**

transfer RNA (tRNA), a kind of RNA that carries an anticodon (three nucleotide bases) and a specific amino acid. The identity of the amino acid is determined by the sequence of nucleotides in the anticodon. There are 64 possible anticodons and about two dozen amino acids that are found in proteins. This means that several anticodons may specify to the same amino acid. Each anticodon is complementary to a specific codon in the messenger RNA. The tRNAs (with their amino acids attached) translate the sequence of codons in messenger RNA into a sequence of amino acids in a polypeptide. Also called **adaptor RNA.**

transfixation /-fiksā′shən/, a surgical procedure in which, in an amputation, the soft tissues are cut through from one side to the other, close to the bone. The muscles are then divided from within outward.

transformation /-fôrmā′shən/ [L, *transformare,* to change shape], the integration of exogenous genes into chromosomes in a form that is recognized by the replicative and transcriptional apparatus of the host cell. Transformation occurs rarely in most cell populations.

transformer /-fôr′mər/ [L, *transformare,* to change shape], an electric apparatus that changes alternating current of one voltage into a different voltage of the same frequency.

transforming growth factor (TGF), a group of proteins produced by the cells of a tumor that, when inoculated into a normal cell culture, causes a disorderly increase in the number of cells in the culture.

transfusion /-f(y)o͞o′zhən/ [L, *trans* + *fundere,* to pour], the introduction into the bloodstream of whole blood or blood components, such as plasma, platelets, or packed red blood cells. Whole blood may be infused into the recipient directly from a donor matched for the ABO blood group and antigenic subgroups, but more frequently the donor's blood is collected and stored by a blood bank. See also **blood transfusion. —transfuse,** *v.*

transfusion reaction, any adverse event following a blood transfusion, attributed to the transfusion. The most common reactions are allergic, manifested by hives and urticaria, and febrile nonhemolytic, shown by chills and fever. More serious reactions are hemolytic, due to an antibody in the recipient to an antigen on the donor's red cells, anaphylactic, bacterial contamination of the donor unit, transfusion-related acute lung injury (TRALI), and transfusion-associated circulatory overload (TACO). Delayed reactions may include delayed hemolytic, disease transmission, alloimmunization to red cell or HLA antigens, posttransfusion purpura, and transfusion-associated graft-vs-host-disease. See also **hemolysis.**

■ OBSERVATIONS: Fever is the most common transfusion reaction; urticaria is a relatively common allergic response. Asthma, vascular collapse, and renal failure occur less commonly. A hemolytic reaction from red blood cell incompatibility is serious and must be diagnosed and treated promptly. Symptoms develop shortly after beginning the transfusion, before 50 mL has been given, and include a throbbing headache, sudden deep severe lumbar pain, precordial pain, dyspnea, and restlessness. Objective signs include ruddy facial flushing followed by cyanosis and distended neck veins; rapid, thready pulse; diaphoresis; and cold, clammy skin. Profound shock may occur within 1 hour.

■ INTERVENTIONS: When a hemolytic reaction is suspected, the transfusion is promptly terminated and the infusion line kept open with a normal solution of IV fluid. The remaining bank blood is saved for a repeat type and crossmatch against a fresh sample of blood from the recipient. Direct and indirect antiglobulin tests are usually ordered to detect hemolytic antibodies, and a sample of urine is examined for free hemoglobin. Immediate treatment may include IV mannitol and a solution of 5% dextrose in water to maintain urine flow of more than 100 mL per hour. In the presence of oliguria, the possibility of acute renal failure is evaluated and the patient managed accordingly. Hypovolemia is corrected with saline or plasma expanders, but the administration of more whole blood is avoided, if possible.

■ NURSING CONSIDERATIONS: The need for exceptional care to ensure that typed and crossmatched blood conforms to compatibility standards is emphasized. The identifying information on the blood container is always checked against the transfusion records and the patient's identification on the band. Questioning the patient about previous transfusions may elicit warning indications of possible adverse reactions. After the transfusion is started, the patient is watched for objective signs of a transfusion reaction and is questioned for subjective symptoms. Routine temperature checks are done to detect febrile reactions that can be controlled by antipyretic drugs.

transfusion-related acute lung injury (TRALI), a syndrome seen in persons receiving transfusions, characterized by pulmonary edema, dyspnea, hypoxemia, hypotension, and fever; it is thought to be a reaction to antibodies or other components of the donor blood product. The blood transfusion must be immediately stopped. Patients need oxygen support, and in some cases the syndrome can be fatal.

transgender, individuals who do not fit within rigid gender norms and incorporate one or more aspects, traits, social roles or characteristics of the opposite gender.

transgene /trans′jēn/, a gene that has been transferred from one genome into another. For example, a mouse with a rat hormone gene grows much larger than normal. **—transgenic,** *adj.*

transient /tran′shənt, tran′zē·ənt/ [L, *transire,* to go through], pertaining to a condition that is temporary, such as transient ischemic attack.

transient global amnesia (TGA) [L, *transire,* to go through, *globus,* ball; Gk, *amnesia,* forgetfulness], a temporary short-term memory loss followed by full recovery. The disorder tends to affect middle-aged adults and may be attributed to cerebral ischemia. It is usually not accompanied by other mental deficiencies.

transient ischemic attack (TIA), an episode of cerebrovascular insufficiency, usually associated with partial occlusion of a cerebral artery by an atherosclerotic plaque or an embolus. The symptoms vary with the site and degree of occlusion. Disturbance of normal vision in one or both eyes, dizziness, weakness, dysphasia, numbness, or unconsciousness may occur. The attack usually lasts a few minutes. In rare cases symptoms continue for several hours.

transient lower esophageal sphincter relaxation, relaxation of the lower esophageal sphincter in response to gastric distension, lasting for 10 to 30 seconds and resulting in gastroesophageal reflux.

transient monocular blindness, an episode of total or partial loss of vision in one eye, caused by ischemia of the eye and lasting several minutes or longer. The term is sometimes used synonymously with **amaurosis fugax** and sometimes to designate an episode of longer duration. Also called *transient monocular visual loss.*

transient myeloproliferative disorder, usually transient leukocytosis associated with Down syndrome and generally diagnosed in the first few weeks of life. It is often accompanied by hepatosplenomegaly, pericardial and pleural effusions, hepatic disease, and a pustular rash. Although spontaneous remission occurs in most cases, some affected infants develop a myelodysplastic syndrome or acute leukemia. Also called **congenital leukemoid reaction** and *transient leukemia of infancy.*

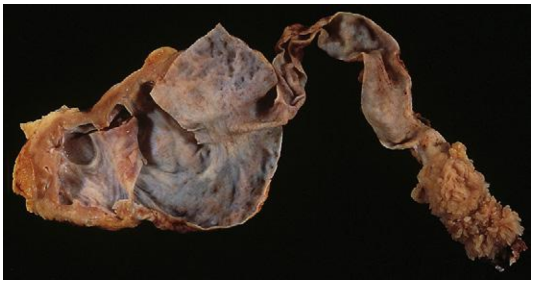
transient myopia [L, *transire,* to go through; Gk, *myops,* nearsighted], a temporary change in visual accommodation secondary to trauma, high blood sugar level, sulfanilamide therapy, and other conditions. See also **pseudomyopia.**

transillumination /-ilo͞o′minā′shən/ [L, *trans,* through, *illuminare,* to light up], **1.** the passage of light through a solid or liquid substance. **2.** the passage of light through body tissues for the purpose of examining a structure interposed between the observer and the light source. A diaphanoscope is an instrument introduced into a body cavity to transilluminate tissues.

transition /tranzish′ən/ [L, *transire,* to go through], the last phase of the first stage of labor, sometimes indicated by cervical dilation of 8 to 10 cm.

transitional /tranzish′ənəl/ [L, *transire,* to go through], between a previous and a succeeding state, or in a state of becoming something else.

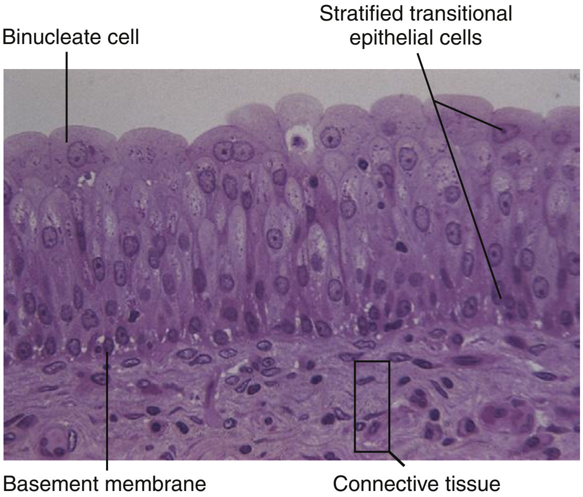
transitional cell carcinoma, a malignant, usually papillary tumor derived from transitional stratified epithelium, occurring most frequently in the bladder, ureter, urethra, or renal pelvis. The majority of tumors in the collecting system of the kidney are of this kind. They have a better prognosis than squamous cell carcinomas in the same site.



Transitional cell carcinoma of the ureter
(Fletcher, 2007)

transitional dentition. See **mixed dentition.**

transitional epithelium, a form of stratified epithelium found characteristically in the mucous membrane of ureter and bladder; in the contracted condition it consists of many cell layers, whereas in the stretched condition fewer layers can be distinguished.



Transitional epithelium
(© Ed Reschke; used with permission)

transitional object, an object used by a child to provide comfort and security while he or she is away from a secure base, such as mother or home.

transitory mania /tran′sitôr′ē/ [L, *transire*, to go through; Gk, *mania*, madness], a mood disorder characterized by the sudden onset of manic reactions that are of short duration, usually lasting from 1 hour to a few days. See also **mania.**

transjugular intrahepatic portosystemic shunt (TIPS) /tranz·jug′yo͞o·lər/, percutaneous creation of a shunt between the hepatic and portal veins within the liver followed by placement of an expandable stent in the tract created, performed by a transjugular route under radiological guidance. It is done for the treatment of bleeding esophageal varices.

translation /-lā′shən/ [L, *translatio*, handing over], the process in which the genetic information carried by nucleotides in messenger RNA directs the amino acid sequence in the synthesis of a specific polypeptide. See also **anticodon, genetic code.**

translocation /-lōkā′shən/ [L, *trans* + *locus*, place], the rearrangement of DNA within a chromosome or the transfer of a segment of one chromosome to a nonhomologous one. In simple translocations, an end segment of one chromosome is transferred onto the end of another, involving a single break in only one of the chromosomes. Translocations in which material from the middle of one chromosome is shifted to the middle of another one are more complex and involve at least three breaks in the participating chromosomes. Such shifting of genetic material can result in serious disorders, such as Down syndrome, which can be caused by a 14/21 translocation, and chronic granulocytic leukemia, in which part of the long arm of chromosome 22 is translocated to the short arm of chromosome 9. Kinds of translocations are **balanced translocation, reciprocal translocation,** and **robertsonian translocation.**

translucent /-lo͞o′sənt/ [L, *trans*, across, *lucens*, shining], pertaining to a medium through which light can pass in a diffused manner so that a field is illuminated but objects cannot be seen distinctly. Compare **transparent.**

transmethylation /-meth′ilā′shən/, the transfer of a methyl group from one compound to another.

transmigration /-mīgrā′shən/ [L, *trans* + *migrare*, to migrate], a movement from one side to another, from inside to outside, or from outside to inside.

transmissible /-mis′ibəl/ [L, *transmittere*, to transmit], capable of being passed from one person or place to another, as in the transmission of a disease.

transmissible neurodegenerative disease. See **prion disease.**

transmissible spongiform encephalopathy, a group of fatal neurodegenerative diseases that are unique in having either infectious or genetic causes. Examples include **Creutzfeldt-Jakob disease** and **Gerstmann-Sträussler syndrome.** A homozygous prion protein genotype predisposes individuals to susceptibility to the diseases.

transmission /-mish′ən/ [L, *transmittere*, to transmit], the transfer or conveyance of a thing or condition, such as a neural impulse, infectious or genetic disease, or a hereditary trait, from one person or place to another. **—transmissible,** *adj.*

transmission-based precautions, safeguards designed for patients documented or suspected to be infected with highly transmissible or epidemiologically important pathogens for which additional precautions beyond standard precautions are needed to interrupt transmission in hospitals. There are three types of transmission-based precautions: airborne precautions, droplet precautions, and contact precautions. They may be combined for diseases that have multiple routes of transmission. They are to be used either singularly or in combination, in addition to standard precautions. See also **Airborne Precautions, contact precautions, Droplet Precautions, Standard Precautions.**

transmission scanning electron microscope, an instrument that transmits a highly magnified, well-resolved, three-dimensional image on a television screen, thus combining the advantages of the electron and the scanning electron microscopes. Compare **electron microscope, scanning electron microscope.**

transmission scanning electron microscopy (TSEM), a technique using a transmission scanning electron microscope in which the atomic number of the part of the sample being scanned is determined and used to modulate a beam of electrons in a cathode-ray tube and in the beam scanning the sample. The image produced is clear, three-dimensional, and highly magnified. Compare **electron microscopy, scanning electron microscopy.**

transmitted light [L, *transmittere,* to transmit; AS, *leoht*], light that has passed through a transparent medium.

transmitter substance. See **neurotransmitter.**

transmucosal /trans′mu-ko′sal/, entering through, or across, a mucous membrane, as the administration of a drug via the cavity between the cheek and gum.

transmural /-m(y)o͞o′rəl/ [L, *trans* + *murus,* wall], pertaining to the entire thickness of the wall of an organ, such as a transmural myocardial infarction, or through any wall such as the body or cyst of a hollow structure.

transmural infarction, death of myocardial tissue that extends from the endocardium to the epicardium as a result of a myocardial infarction.

transmutation /-m(y)o͞otā′shən/ [L, *transmutare,* to change], **1.** a mutation that causes a significant species change during evolution. **2.** the conversion of one chemical element into another by radioactive bombardment.

transovarial transmission /-ōver′ē·əl/ [L, *trans* + *ovum,* egg], the transfer of pathogens to succeeding generations through invasion of the ovary and infection of the eggs, such as occurs in arthropods, primarily ticks and mites.

transparent /-per′ənt/ [L, *trans,* across, *parere,* to appear], pertaining to a clear medium that allows for the transmission of light so that objects on the other side are distinguishable. Compare **translucent.**

transparent septum, a triangular double membrane situated in the median plane and separating the anterior horns of the lateral ventricles of the brain. Also called **septum pellucidum.**

transpeptidase /-pep′tidās/, an enzyme that catalyzes the transfer of an amino group from one peptide chain to another.

transpeptidation /-pep′tidā′shən/, the transfer of an amino acid from one peptide chain to another.

transplacental /trans′pləsen′təl/ [L, *trans* + *placenta,* flat cake], across or through the placenta, specifically in reference to the exchange of nutrients, waste products, and other material between the developing fetus and the mother.

transplant /trans′plant, transplant′/ [L, *transplantare*], **1.** *v*, to transfer an organ or tissue from one person to another or from one body part to another to replace a diseased structure, restore function, or change appearance. Skin and kidneys are the most frequently transplanted structures. Others include cartilage, bone, bone marrow, corneal tissue, parts of blood vessels and tendons, hearts, lungs, and livers. Preferred donors are identical twins or people having the same blood type and immunological characteristics. Success of the transplant depends on overcoming the rejection of the donor tissue by the recipient's immune system. With the patient under local or general anesthesia, the recipient site is prepared, and the donor structure is grafted in place. Its oxygenation and blood supply are preserved during the procedure until the circulation can be restored at the new site. After surgery circulation in the area is observed for signs of impairment. Antirejection drugs are given to suppress the production of antibodies to the foreign tissue proteins. Signs of rejection reaction include fever, pain, and loss of function, usually occurring in the first 4 to 10 days after transplantation. An abscess may form if the reaction is not subdued promptly. The grafted structure may require several weeks to become established. Late rejection may occur several months or even 1 year later. **2.** *n*, any tissue or organ that is transplanted. **3.** *adj*, pertaining to a tissue or organ that is transplanted, a recipient of a donated tissue or organ, or a phenomenon associated with the procedure. Also called **graft, transplantation.**

transplantation /-plantā′shən/ [L, *transplantare,* to transplant], the transfer of tissue from one site to another or from one person or organism to another.

transplantation endometriosis [L, *transplantare,* to transplant; Gk, *endon,* within, *metra,* womb, *osis,* condition], endometrial tissue that is accidentally transplanted to the incision wound during pelvic surgery.

transport /trans′pôrt/ [L, *trans,* across, *portare,* carry], the movement or transference of biochemical substances from one site to another. Active transport involves an expenditure of energy, whereas passive transport allows movement down a gradient without an energy expenditure.

transport: interfacility, a nursing intervention from the Nursing Interventions Classification (NIC) defined as moving a patient from one facility to another. See also **Nursing Interventions Classification.**

transport: intrafacility, a nursing intervention from the Nursing Interventions Classification (NIC) defined as moving a patient from one area of a facility to another. See also **Nursing Interventions Classification.**

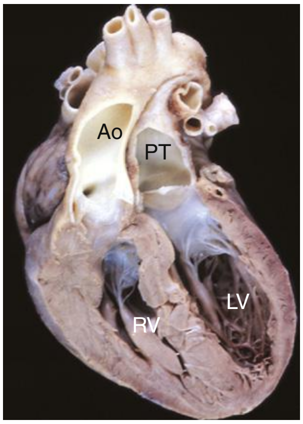
transport maximum, the highest rate in milligrams per minute at which the renal tubules can transfer a substance either from the tubular luminal fluid to the interstitial fluid or from the interstitial fluid to the tubular luminal fluid, beyond which it may be excreted in the urine. In kidney function tests, it is expressed as T_m with inferior letters representing the substance used in the test, such as T_{mPAH} (transport maximum for *p*-aminohippuric acid). Also called **tubular maximum.**

transposable element. See **transposon.**

transposase /trans′pəzās/, an enzyme involved in the movement of a DNA fragment from one site in the genome to another.

trans position /-pəsish′ən/ [L, *transponere*], **1.** an abnormality occurring during embryonic development in which a body part normally on the left is found on the right or vice versa. **2.** the shifting of genetic material from one chromosome to another at some point in the reproductive process, often resulting in a congenital anomaly. **—transpose,** *v.*

transposition of the great vessels, a congenital cardiac anomaly in which the pulmonary artery arises from the left ventricle and the aorta from the right ventricle and there is no communication between the systemic and pulmonary circulations. Life is impossible with this anomaly unless there are associated cardiac defects, such as a septal defect or a patent ductus arteriosus, that enable the mixing of oxygenated and unoxygenated blood. The severity of the condition depends on the type and size of the associated defect. The



Transposition of the great vessels
(Damjanov and Linder, 2000)

primary symptoms are cyanosis and hypoxia, especially in infants with small septal defects, although cardiomegaly is usually evident a few weeks after birth. Signs of congestive heart failure develop rapidly, especially in infants with large ventricular septal defects. Definitive diagnosis is based on cardiac catheterization. Surgical correction of the defect is postponed, if possible, until after 6 months of age, when the infant can better tolerate the procedure. Immediate palliative surgical procedures such as the Rashkind procedure may be performed to decrease pulmonary vascular resistance and prevent congestive heart failure. See also **blue baby.**

transposon /transpō′sən/ [L, *transponere* + on], a segment of DNA that can move from one place to another in a cell's genome or between a bacterial cell and a plasmid or virus. Viruses may even carry a transposon from one bacterium to another. Also called **jumping gene, transposable element.**

transpulmonary pressure /-pul′məner′ē/, the difference between intraalveolar and intrapleural pressure, or the pressure acting across the lung from the pleural space to the alveoli.

transsect. See **transect.**

transsection /transek′shən/ [L, *trans,* across, *sectio*], a cross section of a biological specimen or a cut across the long axis. Also spelled **transection.**

transseptal fiber /transep′təl/ [L, *trans* + *saeptum,* wall], any of the many filamentous tissues of the gingival system that extend mesially from the supraalveolar cementum of one tooth, through the interdental-attached gingiva above the septum of the alveolar bone, to the distal cementum of an adjacent tooth.

transsexual /transek′cho͞o·əl/, a person whose gender identity is the opposite of his or her biological sex.

transsexualism /-iz′əm/, a condition in which a person has an intense desire to change one's biological sex and live as a member of the opposite sex. It is considered a psychiatric disorder if the condition continues for more than 2 years. Some transsexual individuals cross-dress and seek medical or surgical help to change their physical sex characteristics.

transtentorial herniation /trans′tentôr′ē·əl/ [L, *trans* + *tentorium,* tent, *hernia,* rupture], a bulge of brain tissue out of the cranium through the tentorial notch, caused by increased intracranial pressure. See also **tentorial herniation.**

transthermia. See **thermopenetration.**

transthoracic /trans′thôras′ik/, across or passing through the thorax.

transthoracic impedence, resistence to transmission of electric current represented by the skin, fat, muscle, and lung tissues in a patient's chest.

transthoracic pacemaker /-thôras′ik/ [L, *trans,* across; Gk, *thorax,* chest; L, *passus,* step; ME, *maken*], a permanent pacemaker with the pulse generator located in the abdominal wall and the pacing wires attached directly to the epicardium.

transtibial amputation, an amputation of the lower leg between the ankle and knee. Also called **below-knee amputation** and **BK amputation.**

transtracheal oxygen /-trā′kē·əl/ [L, *trans,* across; Gk, *tracheia,* rough artery, *oxys,* sharp, *genein,* to produce], the administration of oxygen via a low-flow catheter inserted directly into the trachea. It is sometimes preferred to the administration of oxygen through a nasal cannula because there is limited loss of oxygen to the environment. Disadvantages include increased risk of infection.

transtrochanteric osteotomy /-trō′kənter′ik/ [L, *trans,* across; Gk, *trochanter,* runner, *osteon* + *temnein,* to cut], a surgical division of the upper end of the femur through the area of the trochanters.

transubstantiation /trans′əbstan′chē·ā′shən/, the replacement or substitution of one kind of tissue for another.

transudate /trans′yədāt/ [L, *trans* + *sudare,* to sweat], a fluid passed through a membrane or squeezed through a tissue or into the space between the cells of a tissue. It is thin and watery and contains few blood cells or other large proteins. See also **edema.**

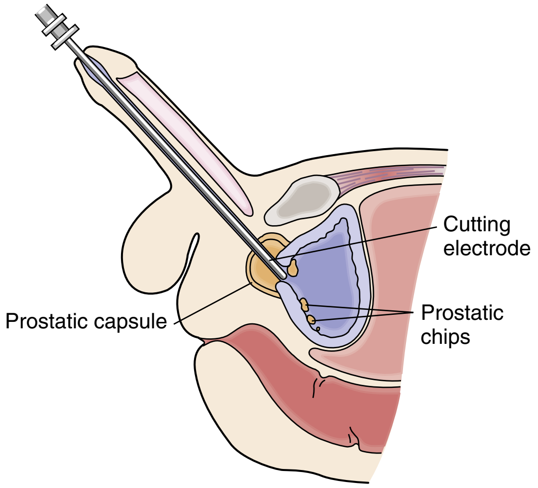
transudation /-yədā′shən/, **1.** the passage of a substance through a membrane as a result of a difference in hydrostatic pressure. **2.** the passage of a fluid through a membrane with nearly all the solutes of the fluid remaining in solution or suspension.

transudative ascites /transyo͞o′dətiv/, an abnormal accumulation in the peritoneal cavity of a fluid that characteristically contains scant amounts of protein and cells. Ascitic fluids with protein levels of less than 2.5 g/mL are considered to be transudates. Transudative ascites is indicative of cirrhosis or congestive heart failure rather than infection, inflammation, or a tumor.

transuranic element, any of the elements with atomic numbers above that of uranium (whose atomic number is 92). All are radioactive and have very short half-lives. None, except for neptunium and plutonium in very small amounts, occurs naturally. They are produced artificially in nuclear reactors and particle accelerators. Also called *transuranium element*.

transurethral laser-induced prostatectomy (TULIP), a type of noncontact laser prostatectomy.

transurethral resection (TUR) /trans′yo͝orē′thrəl/ [L, *trans* + Gk, *ourethra,* urethra; L, *re,* again, *secare,* to cut], the surgical removal of a structure performed through the urethra.



Transurethral resection of the prostate

(Monahan et al, 2007)

transurethral resection of the prostate (TURP), resection of the prostate by means of a cystoscope passed through the urethra.

transvaginal /trans·vaj′i·nəl/ [L, *trans,* across + *vagina,* sheath], performed through the vagina.

transverse /-vurs′/ [L, *transversus*, oblique], at right angles to the long axis of any common part, such as the planes that cut the long axis of the body into upper and lower parts and are at right angles to the sagittal and frontal planes.

transverse acetabular ligament. See **acetabular labrum.**

transverse cervical nerve, a branch of the cervical plexus arising from the anterior rami of the second and third cervical nerves that provides cutaneous innervation to the neck.

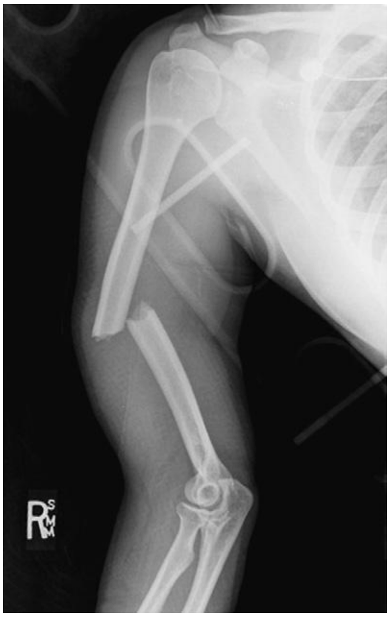
transverse colon, the segment of the colon that extends from the end of the ascending colon at the hepatic flexure on the right side across the midabdomen to the beginning of the descending colon at the splenic flexure on the left side.

transverse colon volvulus, a rare type of colonic volvulus involving the transverse colon.

transverse fissure, a fissure dividing the dorsal surface of the diencephalon and the ventral surface of the cerebral hemisphere. Also called **fissure of Bichat.**

transverse foramen [L, *transversus* + *foramen,* hole], an opening through the transverse process of a cervical vertebra.

transverse fracture, a fracture that occurs at right angles to the longitudinal axis of the bone involved.



Transverse fracture of the humerus
(Kowalczyk and Mace, 2009)

transverse lie, abnormal presentation of a fetus in which the long axis of the baby's body is across the long axis of the mother's body. Unless the baby turns spontaneously or is turned by means of external or internal version, vaginal delivery is impossible.

transverse ligament of the atlas, a thick, strong ligament stretched across the ring of the atlas, holding the dens against the anterior arch. The transverse ligament divides the circular opening of the atlas into posterior and anterior parts. The posterior part transmits the spinal cord and its membranes; the anterior part contains the dens.

transverse magnetization, the magnetization vector oriented in a plane perpendicular to the main external magnetic field in magnetic resonance.

transverse mesocolon /mez′ōkō′lən/, a broad fold of the peritoneum connecting the transverse colon to the dorsal wall of the abdomen. It is continuous with the greater omentum along the ventral surface of the transverse colon and contains between its layers the vessels that supply the transverse colon. Its two layers diverge along the anterior border of the pancreas. Compare **mesentery proper, sigmoid mesocolon.**

transverse myelitis [L, *transversus* + Gk, *myelos,* marrow, *itis,* inflammation], an acute attack of spinal cord inflammation involving both sides of the cord.

transverse palatine suture, the line of junction between the processes of the maxilla and the horizontal parts of the palatine bones that form the hard palate.

transverse pericardial sinus, a passage between the superior and posterior reflections of the serous pericardium. It lies posteriorly to the ascending aorta and the pulmonary trunk, anteriorly to the superior vena cava, and superiorly to the left atrium.

transverse plane, any one of the planes cutting across the body perpendicular to the sagittal and the frontal planes (at right angles to the long axis of the body), dividing the body into superior and inferior parts. Also called **cardinal horizontal plane.** Compare **frontal plane, median plane, sagittal plane.**

transverse presentation [L, *transversus* + *praesentare,* to show], a presentation of the fetal body in an oblique or transverse position across the birth canal.

transverse process, a process of the vertebra that extends posterolaterally from the junction of the pedicle and lamina on each side and is the site for articulation with the ribs in the thoracic region.

transverse rectal folds, semilunar transverse folds in the rectum that support the weight of feces. Also called **Houston's valves.** See also **rectum.**

transverse relaxation time. See **relaxation time.**

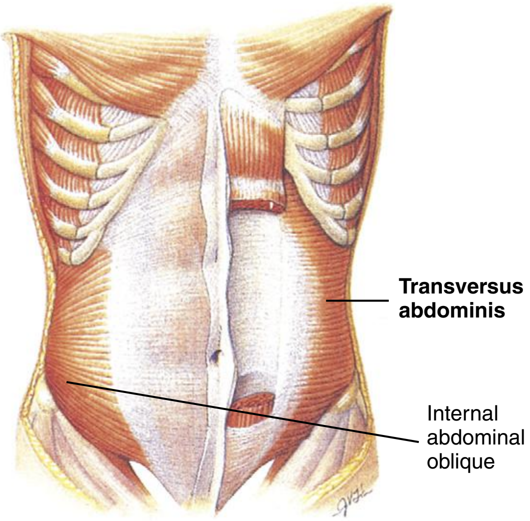
transverse septum, a thick plate of mesodermal tissue that occupies the space between the thoracic cavity and yolk stalk in the early embryo, forming a transverse partition partially separating the coelomic cavity into thoracic and abdominal portions. It gives rise to the central tendon of the diaphragm.

transverse sinus, one of a pair of large venous channels in the posterior superior group of sinuses serving the dura mater, draining into the sigmoid sinuses, then the internal jugular vein. Compare **confluence of the sinuses, inferior sagittal sinus, occipital sinus, straight sinus, superior sagittal sinus.**

transverse tarsal joint, the joint formed by the talocalcaneonavicular and calcaneocuboid joints together.

transversospinales muscles, a group of muscles deep to the erector spinae that consist of the semispinalis, multifidus, and rotatores muscles. When these muscles contract bilaterally, they extend the vertebral column, an action similar to that of the erector spinae group. However, when muscles on only one side contract, they pull the spinous processes toward the transverse processes on that side, causing the trunk to turn or rotate in the opposite direction.

transversus abdominis /-vur′səs/, one of a pair of transverse abdominal muscles that are the anterolateral muscles of the abdomen, lying immediately under the internal abdominal oblique. Arising from the inguinal ligament, the iliac crest, the thoracolumbar fascia, and the last six ribs, it inserts into the linea alba. It serves to constrict the abdomen and, by compressing the contents, to assist in urination, defecation, emesis, parturition, and forced expiration. Also called *transversalis*. Compare **pyramidalis, rectus abdominis.**



Transversus abdominis
(Thibodeau and Patton, 2003)

transversus thoracis muscles, muscles found on the deep surface of the anterior thoracic wall that lie deep to the internal thoracic vessels and secure these vessels to the wall.

transvesical prostatectomy, prostatectomy through an incision of the urinary bladder.

transvestism /-ves′tizəm/, a tendency to achieve psychic and sexual relief by dressing in the clothing of the opposite sex.

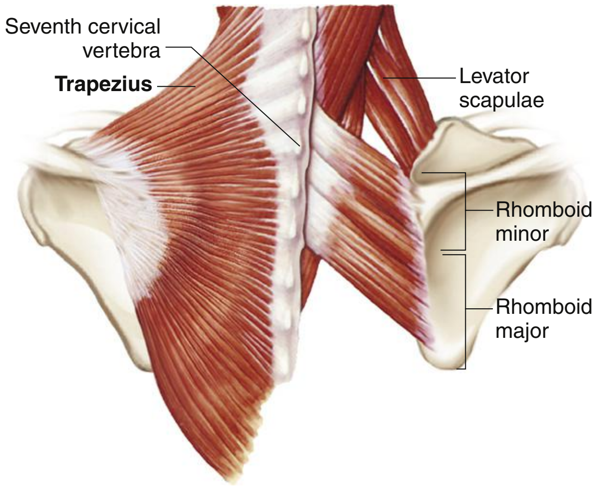
Tranxene, a trademark for a benzodiazepine sedative-hypnotic **(clorazepate dipotassium).**

tranylcypromine sulfate /tran′əlsip′rəmēn/, a monoamine oxidase inhibitor that acts as an antidepressant.
■ INDICATIONS: It is prescribed in the treatment of severe reactive or endogenous mental depression without melancholia and has an unlabeled use for the treatment of posttraumatic stress disorder.
■ CONTRAINDICATIONS: Cerebrovascular or cardiovascular diseases, paranoid schizophrenia, liver dysfunction, alcoholism, pheochromocytoma, or known hypersensitivity to this drug prohibits its use. It is not given to children under 16 years of age.
■ ADVERSE EFFECTS: Among the most serious adverse effects are severe hypertensive episodes that can be precipitated by ingestion of foods rich in tyramine or by concurrent administration of many sympathomimetic drugs. Common side effects include headache, vertigo, dry mouth, blurred vision, and orthostatic hypotension.

trapeze bar /trapēz′/, a triangular metal apparatus above a bed, used to help the patient move and support weight during transfer or position change.

trapezium /trəpē′zē·əm/ *pl.* **trapezia, trapeziums** [Gk, *trapezion,* small table], a carpal bone in the distal row of carpal bones. The trapezium articulates with the scaphoid proximally, the first metacarpal distally, and the trapezoideum and the second metacarpal medially. Also called **greater multangular, os trapezium.**

trapezius /trəpē′zē·əs/ [Gk, *trapezion,* small table], a large, flat, triangular superficial muscle of the shoulder and upper back. It arises from the occipital bone, the ligamentum nuchae, and the spinous processes of the seventh cervical and all the thoracic vertebrae. It acts to rotate the scapula upward; adduct, raise, or lower the shoulder; and retract the shoulder.



Trapezius
(Patton and Thibodeau, 2010)

trapezoid /trap′əzoid/ [Gk, *trapezion,* small table, *eidos,* form], having the shape of a trapeze, an irregular four-sided figure with one set of parallel sides.

trapezoidal arch /trap′əzoidəl/ [Gk, *trapezion* + *eidos,* form; L, *arcus,* bow], a dental arch that has slightly less convergence than that of a tapering arch. The anterior teeth in the arch are somewhat square or abruptly rounded from tip to tip of the canines, which are at the corners of the arch.

trapezoid bone [Gk, *trapezion* + *eidos* + AS, *ban*], the carpal bone, located in the distal row of carpal bones between the trapezium and the capitate. It resembles a wedge, with the broad end at the dorsal surface, the narrow end at the palmar surface. Also called **lesser multangular bone, os trapezoideum.**

TRAPS, abbreviation for **tumor necrosis factor receptor-associated periodic syndrome.** See **familial periodic fever.**

trastuzumab, a miscellaneous antineoplastic.
■ INDICATIONS: It is used in the treatment of metastatic breast cancer with the overexpression of HER2.
■ CONTRAINDICATIONS: Factors that prohibit its use include known hypersensitivity to this drug or to Chinese hamster ovary cell protein.
■ ADVERSE EFFECTS: Life-threatening effects are tachycardia, congestive heart failure, and leukopenia. Other adverse reactions include depression, insomnia, neuropathy, peripheral neuritis, acne, herpes simplex, nausea, vomiting, anorexia, diarrhea, anemia, arthralgia, bone pain, edema, peripheral edema, cough, dyspnea, pharyngitis, rhinitis, and sinusitis. Common side effects include dizziness, numbness, paresthesias, rash, and flulike syndrome (fever, headache, chills).

Trasylol /tras′ilol/, a trademark for a preparation of **aprotinin,** an antihemorrhagic agent.

trauma /trou′mə, trô′mə/ [Gk, wound], **1.** physical injury caused by violent or disruptive action or by the introduction into the body of a toxic substance. **2.** psychic injury resulting from a severe emotional shock. **—traumatic,** *adj.,* **traumatize,** *v.*

-trauma, suffix meaning a "wound or injury, psychic or physical": *arthrotrauma, barotrauma, neurotrauma.*

trauma center, a service providing emergency and specialized intensive care to critically ill and injured patients.

trauma registry, a repository of data on the incidence, diagnosis, and treatment of acute trauma victims treated by emergency service personnel.

trauma therapy: child, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of an interactive helping process to resolve a trauma experienced by a child. See also **Nursing Interventions Classification.**

traumatic /trômat′ik/ [Gk, *trauma,* wound], pertaining to an injury, usually a serious and unexpected injury.

traumatic abscess, a pus collection that develops in tissue that has been damaged by a wound or injury.

traumatic anesthesia [Gk, *trauma* + *anaisthesia,* lack of feeling], a total lack of normal sensation in a part of the body, resulting from injury, destruction of nerves, or interruption of nerve pathways.

traumatic bone cyst. See **simple bone cyst.**

traumatic delirium, delirium after severe head injury, characterized by alertness and consciousness, with disorientation, confabulation, and amnesia apparent. See also **delirium.**

traumatic dislocation [Gk, *trauma,* wound; L, *dis* + *locare*], a dislocation caused by an injury.

traumatic epilepsy [Gk, *trauma,* wound, *epilepsia,* seizure], a form of motor or sensory seizures caused by a brain injury. Also called **posttraumatic epilepsy.**

traumatic fever, an elevation in body temperature secondary to mechanical trauma, particularly a crushing injury. Such fevers may last 1 or 2 days. The increased body temperature may help provide resistance to subsequent infection, and increased wound temperature may accelerate local healing.

traumatic gangrene [Gk, *trauma,* wound, *gaggraina*], gangrene that follows a severe injury resulting in damage to blood vessels.

traumatic herpes [Gk, *trauma,* wound, *herpein,* to creep], herpes that develops at the site of an injury.

traumatic meningitis [Gk, *trauma,* wound, *meninx,* membrane, *itis,* inflammation], meningitis that develops as a result of injury to the skull or spinal column.

traumatic myelitis [Gk, *trauma,* wound, *myelos,* marrow, *itis,* inflammation], a spinal cord inflammation resulting from an injury.

traumatic myositis, an inflammation of the muscles resulting from a wound or other trauma.

traumatic neuritis [Gk, *trauma,* wound, *neuron,* nerve, *itis,* inflammation], inflammation of a nerve, resulting from an injury.

traumatic neuroma, a mass of nerve elements and fibrous tissue produced by the proliferation of Schwann cells and fibroblasts after severe injury to a nerve. A kind of traumatic neuroma is **amputation neuroma.**

traumatic occlusion, repeated excessive force in closure of the teeth that injures the teeth, the periodontal tissues, the residual ridge, or other oral structures. The closure extends beyond the reparative ability of the attachment apparatus (cementum, periodontal ligaments, and alveolar bone).

traumatic proctitis, rectal irritation caused by a foreign body in the rectum, such as during a medical procedure or anal intercourse.

traumatic psychosis [Gk, *trauma,* wound, *psyche,* mind, *osis,* condition], a psychiatric disorder that results from injury to the head, with symptoms usually indicating brain trauma. It is differentiated from psychic trauma in which personality damage can be traced to an unpleasant experience, such as sexual assault.

traumatic rhabdomyolysis, skeletal muscle destruction after a crush injury. During reperfusion of the damaged tissue after crushing pressure has been relieved, myoglobin, potassium, and phosphorus are released into the circulation, causing symptoms of renal failure, hypovolemic shock, and hyperkalemia.

traumatic shock [Gk, *trauma,* wound; Fr, *choc*], the emotional or psychological state after trauma that may produce abnormal behavior. The most common types are hypovolemic shock from blood loss and neurogenic shock caused by a disruption of the integrity of the spinal cord.

traumatic spondylopathy. See **Kümmell's disease.**

traumatic thrombosis [Gk, *trauma,* wound, *thrombos,* lump, *osis,* condition], intravascular coagulation of a vein or other blood vessel after injury or irritation. The condition may develop as an adverse effect of an IV injection that damages the wall of a vein. See also **thrombophlebitis.**

traumatize. See **trauma.**

traumato-, prefix meaning "trauma, injury, wound": *traumatogenic, traumatopnea, traumatopyra.*

traumatology /trô′mətol′əjē/ [Gk, *trauma* + *logos,* science], **1.** the study of wounds and injuries. **2.** a surgical specialty dealing with the treatment of wounds, injuries, and resulting disabilities. **—traumatologic, traumatological,** *adj.*

traumatopathy /trô′mətop′əthē/ [Gk, *trauma* + *pathos,* disease], a pathological condition resulting from a wound or injury. **—traumatopathic,** *adj.*

traumatophilia /trô′mətōfil′ē·ə/ [Gk, *trauma* + *philein,* to love], a psychological state in which the individual derives unconscious pleasure from injuries and surgical operations. **—traumatophiliac,** *n.,* **traumatophilic,** *adj.*

traumatopnea /trô′mətop′nē·ə/ [Gk, *trauma* + *pnein,* to breathe], partial asphyxia with collapse of the patient, caused by a penetrating thoracic wound permitting air to enter the pleural space and compress the lungs. Also called **open pneumothorax.**

traumatopyra /trô′mətōpī′rə/ [Gk, *trauma* + *pyr,* fire], an elevated temperature resulting from a wound or injury.

traumatotherapy /-ther′əpē/ [Gk, *trauma* + *therapeia,* treatment], the medical, surgical, and psychological treatment of wounds, injuries, and disabilities resulting from trauma. **—traumatotherapeutic,** *adj.*

traumatropism /trômat′rəpiz′əm/ [Gk, *trauma* + *trepein,* to turn], the tendency of damaged tissue to attract microorganisms and promote their growth, frequently causing infections after injuries, especially burns.

travail /trəvāl′/ [OFr, *travaillier,* to work], **1.** physical or mental exertion, especially when distressful. **2.** in obstetrics, the effort of labor and childbirth.

Travelbee, Joyce, (1926–1973), a nursing theorist who developed the Human-to-Human Relationship Model and theory, presented in her book *Interpersonal Aspects of Nursing* (1966, 1971). Travelbee based the assumptions of her theory on the concepts of logotherapy. Logotherapy theory was first proposed by Viktor Frankl, a survivor of Auschwitz, in his book *Man's Search for Meaning* (1963). Travelbee believed nursing is accomplished through human-to-human relationships that begin with the original encounter and then progress through stages of emerging identities, developing feelings of empathy, and later feelings of sympathy. The nurse and patient attain a rapport in the final stage. See also **logotherapy.**

traveler's diarrhea [OFr, *travailler,* to work; Gk, *dia,* through, *rhein,* to flow], any of several diarrheal disorders commonly seen in people visiting regions of the world other than their own. Such disorders can be caused by bacterial, viral, or parasitic infections. Some strains of *Escherichia coli,* which produce a powerful exotoxin, are the common cause. Other causative organisms include *Giardia lamblia* and species of *Salmonella* and *Shigella.* Symptoms last for a few days and include abdominal cramps, nausea, vomiting, slight fever, and watery stools. Relapse is rare. Treatment depends on identification of the cause and includes rehydration with beverages containing electrolytes. Preventive measures include using pure or boiled water and beverages for drinking and brushing the teeth and eating only fruits and vegetables with a skin or peel that can be removed and discarded before consumption. Also called *Montezuma's revenge,* **turista.**

travel medicine, the subspecialty of tropical medicine consisting of the diagnosis and treatment or prevention of diseases of travelers. Also called *travelers' medicine*.

traverse /travurs′/, **1.** *v,* to travel or pass across, over, or through. **2.** *n,* a single, complete movement of the x-ray tube around the object being scanned in computed tomography.

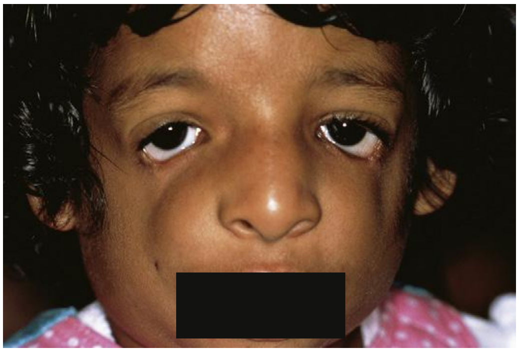
travoprost /trav′o-prost/, a synthetic prostaglandin analogue used in the treatment of elevated intraocular pressure in patients with open-angle glaucoma or ocular hypertension. It is administered topically to the conjunctiva.

tray agglutination test, a type of sperm agglutination test in which small amounts of sperm and serum are mixed on a microscopic tray for examination. Also called *Friberg test*.

trazodone /tra′zo-dōn/, an antidepressant used orally as the hydrochloride salt to treat major depressive episodes with or without prominent anxiety.

TRBF, abbreviation for **total renal blood flow.**

Treacher Collins syndrome [Edward Treacher Collins, English ophthalmologist, 1862–1919], an inherited disorder, characterized by mandibulofacial dysostosis. See also **Pierre Robin's syndrome.**



[redacted]

Treacher Collins syndrome
(Regezi, Sciubba, and Jordan, 2008)

treadmill, exercise equipment that allows the individual to walk or run in place on a rotating belt. A treadmill may be flat or inclined.

treadmill stress test. See **stress test.**

treatment [Fr, *traitement*], **1.** the care and management of a patient to combat, ameliorate, or prevent a disease, disorder, or injury. **2.** a method of combating, ameliorating, or preventing a disease, disorder, or injury. Active or **curative treatment** is designed to cure; palliative treatment is directed to relieve pain and distress; prophylactic treatment is for the prevention of a disease or disorder; **causal treatment** focuses on the cause of a disorder; **conservative treatment** avoids radical measures and procedures; **empiric treatment** uses methods shown to be beneficial by experience; **rational treatment** is based on a knowledge of a disease process and the action of the measures used. Treatment may be **pharmacological,** using drugs; **surgical,** involving operative procedures; or **supportive,** building the patient's strength. It may be **specific** for the disorder, or **symptomatic** to relieve symptoms without effecting a cure.

treatment behavior: illness or injury, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to palliate or eliminate pathology. See also **Nursing Outcomes Classification.**

treatment guardian, a person who is appointed by the court for the purpose of consenting to or refusing medical treatment for a patient.

treatment plan [Fr, *traitement* + L, *planta*], (in dentistry) a schedule of procedures and appointments designed to restore, step by step, a patient's oral health. The plan contains the advantages, disadvantages, costs, alternatives, and sequelae of treatment. It must be presented to the patient, as well as to the insurance company, for approval.

treatment room, a room in a patient care unit, usually in a hospital, in which various treatments or procedures requiring special equipment are performed, such as removing sutures, draining a hematoma, packing a wound, or performing an examination.

Trecator-SC, a trademark for a tuberculostatic **(ethionamide).**

Trechona /trikōn′ə/, a genus of spiders, family Dipluridae, commonly called funnel web spiders, the bite of which is toxic and irritating to humans.

tree [AS, *treow*], **1.** an anatomical structure with branches that spread out like those of a tree, such as the bronchial tree and the tracheobronchial tree. **2.** a pattern of searching for information in a computer database, following a series of branching options from a general category to reach specific desired items while eliminating unwanted possibilities. MEDLINE and other computer databases are organized in a "logic tree" pattern.

-trema, **1.** suffix meaning a "hole, orifice, opening": *gonotrema, helicotrema, peritrema*. **2.** suffix meaning "creatures possessing an opening": *Eurytrema, Monotrema, Troglotrema*.

Trematoda /trem′ətō′də/, a class of flatworms, Platyhelminthes, that includes flukes. The adults are external or internal parasites of vertebrates. Intestinal infections in North America are rare except through flukes in foods imported from Asia or the tropics.

trematode /trem′ətōd/ [Gk, *trematodes,* pierced], any species of flatworm of the class Trematoda, some of which are parasitic to humans, infecting the liver, the lungs, and the intestines. Kinds of trematodes include the organisms causing **clonorchiasis, fascioliasis, paragonimiasis,** and **schistosomiasis.** See also **fluke.**

trematodiasis, infection with trematodes (flukes). Also called *distomiasis*.

trembles /trem′bəls/, a toxic reaction experienced by cattle that have eaten white snakeroot or rayless goldenrod, pasture weeds that contain tremetone, a ketone. The toxic chemical is eliminated in the milk of the cows, causing sickness in humans who drink the milk.

tremor /trem′ər, trē′mər/ [L, shaking], rhythmic, purposeless, quivering movements resulting from the involuntary alternating contraction and relaxation of opposing groups of skeletal muscles, occurring in some elderly individuals, certain families, and patients with various neurodegenerative disorders. Senile tremor is characterized by fine quick movements, especially of the hands, rhythmic head nodding, and increased trembling during purposeful movements. Familial tremor, which may be hereditary, and the tremor occurring in multiple sclerosis also increase during voluntary movement and may be intensified by anxiety, excitement, and self-consciousness. The tremors of Graves' disease, alcoholism, mercury poisoning, and other toxicoses are usually less rhythmic. The tremor in lead poisoning often affects the lips. The fine, quick, continuous tremor present in Parkinson's disease sometimes disappears during purposeful movements. Examples are **resting tremor** and **intention tremor.**

tremulous /trem′yələs/ [L, *tremulare,* to tremble], pertaining to tremors, or involuntary muscular contractions.

tremulous pulse [L, *tremulare,* to tremble, *pulsare,* to beat], a feeble, fluttering pulse.

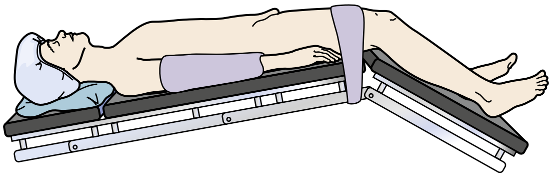
trench fever [OFr, *trenchier,* to cut; L, *febris,* fever], a self-limited infection caused by *Bartonella,* a rickettsial organism transmitted by body lice, characterized by weakness, fever, rash, and leg pains. It was common during World War I but is now rare. Also called **5-day fever, quintana fever.**

trench foot [OFr, *trenchier,* to cut; AS, *fot*], a condition of moist gangrene of the foot caused by the freezing of wet skin.

trench mouth. See *acute necrotizing ulcerative gingivitis.*

Trendelenburg gait /trendel′ənbərg, tren′d(e)lənbo͞org′/ [Friedrich Trendelenburg, German surgeon, 1844–1924], an abnormal gait associated with a weakness of the gluteus medius. It is characterized by the dropping of the pelvis on the unaffected side of the body at the moment of heelstrike on the affected side. In this deviation the pelvic drop during the walking cycle lasts until heelstrike on the unaffected side and is accompanied by an apparent lateral protrusion of the affected hip. The person with a Trendelenburg gait also shortens the step on the unaffected side and displays a lateral deviation of the entire trunk and the affected side during the stance phase of the affected lower limb. This gait is one of the more common gait deviations. Also called **uncompensated gluteal gait.** Compare **compensated gluteal gait.**

Trendelenburg position [Friedrich Trendelenburg], a position in which the head is low and the body and legs are on an inclined plane. It is sometimes used in pelvic surgery to displace the abdominal organs upward, out of the pelvis, or to increase the blood flow to the brain in hypotension and shock.



Trendelenburg position *(Phillips, 2007)*

Trendelenburg test [Friedrich Trendelenburg], a simple test for incompetent valves in a person who has varicose veins. The person lies down and elevates the leg to empty the vein, then stands, and the vein is observed as it fills. If the valves are incompetent, the vein fills from above. If the valves are normal, they do not allow backflow of blood, and the vein fills from below.

Trental, a trademark for an oral hemorrheological drug **(pentoxifylline).**

trepan. See **trephine.**

trephination /trif′inā′shən/, the surgical excision of a circular piece of bone or other tissue accomplished with a cylindric saw.

trephine /trifīn′, trifēn′/ [Gk, *trypan,* to bore], a circular sawlike instrument used in removing pieces of bone or tissue, usually from the skull. Also called **trepan.**

trepidation /trep′idā·shən/ [L, *trepidare,* to tremble], a state of anxiety.

Treponema /trep′ənē′mə/ [Gk, *trepein,* to turn, *nema,* thread], a genus of gram-negative spirochetes, including some pathogenic to humans, such as the organisms causing bejel, pinta, syphilis, and yaws.

treponemal antigen test /trep′o-ne′mal/, any of various tests detecting specific antitreponemal antibodies in serum in the diagnosis of the *Treponema pallidum* infection of syphilis.

Treponema pallidum, an actively motile, slender spirochetal organism that causes syphilis.

treponematosis /trep′ənē′mətō′sis/ *pl.* **treponematoses** [Gk, *trepein* + *nema* + *osis,* condition], any disease caused by spirochetes of the genus *Treponema*. All these infections are effectively treated with penicillin; often one dose, given intramuscularly, results in cure. Kinds of treponematoses are **bejel, pinta, syphilis,** and **yaws.**

treprostinil, an antiplatelet agent used to treat pulmonary arterial hypertension.

-tresia, suffix meaning "perforation": *atresia, proctotresia, sphenotresia.*

tretinoin /tret′inō′in/, a retinoic acid derivative.

■ INDICATIONS: It is prescribed in the topical treatment of acne vulgaris and fine wrinkles and is administered orally for inducing remission in acute promyelocytic leukemia.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or pregnancy prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects of topical administration are photosensitivity and red, edematous, blistered, or crusted skin. Almost everybody taking the drug orally experiences some degree of weakness, fatigue, headache, and fever, but adverse effects are seldom reasons for discontinuing use of the drug.

Trevor's disease. See **dysplasia epiphysealis hemimelica.**

Trexan, a trademark for an oral opioid antagonist **(naltrexone hydrochloride).**

-trexate, suffix for folic acid analogs used as antimetabolites.

TRF, abbreviation for *thyrotropin-releasing factor.* See **thyrotropin-releasing hormone.**

TRH, abbreviation for **thyrotropin-releasing hormone.**

TRH stimulation test, TRH test, abbreviation for *thyrotropin-releasing hormone test.* See **thyrotropin-releasing hormone stimulation test.**

tri-, prefix meaning "three or thrice": *triage, tribrachia, tridermoma.*

triacetin /trī·as′itin/, an antifungal.

■ INDICATIONS: It is prescribed to suppress the growth of superficial fungus infections of the skin, including athlete's foot.

■ CONTRAINDICATIONS: There are no known contraindications.

■ ADVERSE EFFECTS: There are no known serious adverse effects.

triacetyloleandomycin. See **troleandomycin.**

triad /trī′əd/ [Gk, *trias,* three], a combination of three, such as two parents and a child.

triage /trē·äzh′/ [Fr, *trier,* to sort out], **1.** in military medicine, a classification of casualties of war and other disasters according to the gravity of injuries, urgency of treatment, and place for treatment. **2.** a process in which a group of patients is sorted according to their need for care. The kind of illness or injury, the severity of the problem, and the facilities available govern the process, as in a hospital emergency department. **3.** in disaster medicine, a process in which a large group of patients is sorted so that care can be concentrated on those who are likely to survive.

triage: disaster, a nursing intervention from the Nursing Interventions Classification (NIC) defined as establishing priorities of patient care for urgent treatment while allocating scarce resources. See also **Nursing Interventions Classification.**

triage: emergency center, a nursing intervention from the Nursing Interventions Classification (NIC) defined as establishing priorities and initiating treatment for patients in an emergency center. See also **Nursing Interventions Classification.**

triage: telephone, a nursing intervention from the Nursing Interventions Classification (NIC) defined as determining the nature and urgency of a problem(s) and providing directions for the level of care required, over the telephone. See also **Nursing Interventions Classification.**

trial /trī′əl/, a process of quality testing.

trial forceps [Fr, *trier,* to sort out], an obstetric operation consisting of an attempt to deliver an infant with obstetric forceps. The forceps are applied to the baby's head, and moderate traction is applied. The delivery is continued only if the trial indicates that delivery can be accomplished safely. The procedure is abandoned if proper application of the forceps or rotation of the baby's head is not possible or if the trial indicates that completion of the delivery with forceps will require inordinately heavy traction likely to be more traumatic to the mother or baby than cesarean section. Trial forceps is usually performed with a double setup so that cesarean section can be carried out immediately if necessary. Compare **failed forceps.** See also **double setup.**

trial of labor [Fr, *trier,* to sort out; L, *labor,* work], childbirth in which there is doubt as to whether the head of the fetus will pass through the pelvic brim. The situation must be monitored and assessed carefully to avoid fetal or maternal distress.

triamcinolone /trī′amsin′əlōn/, a corticosteroid.

■ INDICATIONS: It is prescribed topically as an antiinflammatory agent in the treatment of dermatoses, stomatitis, and lichen planus lesions, is inhaled for the treatment of allergies and asthma, is injected (e.g., into joints) for the treatment of local inflammation, and is taken orally in low doses for treatment of adrenocortical insufficiency and in higher antiinflammatory/immunosuppressive doses for the treatment of systemic diseases such as systemic lupus erythematosus.

■ CONTRAINDICATIONS: Fungal infections or known hypersensitivity to this drug prohibits its systemic use. Viral or fungal infections of the skin, impaired circulation, or known hypersensitivity to this drug prohibits its topical use.

■ ADVERSE EFFECTS: Among the more serious adverse effects to the systemic administration of the drug are GI, endocrine, neurological, fluid, and electrolyte disturbances. Skin reactions may occur from topical administration of this drug.

triamterene /trī·am′tərēn/, a potassium-sparing diuretic.

■ INDICATIONS: It is usually prescribed alone or with another diuretic in the treatment of edema, hypertension, and congestive heart failure.

■ CONTRAINDICATIONS: Anuria, severe liver or kidney dysfunction, hyperkalemia, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are electrolyte disturbances, particularly hyperkalemia. GI disturbances also may occur.

triangle [L, *triangulus,* three-cornered], a predictable emotional process that takes place when there is difficulty in a relationship. Triangles represent dysfunctional efforts to reduce fusion or conflict in a relationship. The three corners of a triangle can be composed of three people or two people and an object, group, or issue.

triangular bandage /trī·ang′gyələr/, a square of cloth folded or cut into the shape of a triangle. It may be used as a sling, a cover, or a thick pad to control bleeding.

triangular bone, the pyramidal carpal bone in the proximal row on the ulnar side of the wrist. Also called **cuneiform bone, os triquetrum.**

triangular dullness. See **Korányi's sign.**

triangularis /trī·ang′gyo͞o·lar′is/ [L], triangular muscle of facial expression.

triangular ligaments, two folds of peritoneum that, with the coronary ligaments, attach the liver to the diaphragm.

Triavil, a trademark for a central nervous system fixed-combination drug containing a phenothiazine antipsychotic (**perphenazine**) and a tricyclic antidepressant (amitriptyline hydrochloride).

triazolam /tri·az′əlam/, a benzodiazepine hypnotic agent. This drug was withdrawn from the market in the United Kingdom; it continues to be available in the United States. Its prototype is lorazepam.

■ INDICATION: It is prescribed in the short-term treatment of insomnia.

■ CONTRAINDICATIONS: Known sensitivity to this drug or to other benzodiazepines or concurrent use of drugs that block CYP3A4 (e.g., ketoconazole) prohibits its use. It is not given to pregnant women, lactating mothers, or patients younger than 18 years.

■ ADVERSE EFFECTS: Among the most serious adverse effects are anterograde amnesia, paradoxical reactions, tachycardia, depression, confusion or memory impairment, and visual disturbances.

triazole /trī′ah-zōl, tri-a′zōl/, **1.** an organic compound in which three atoms of the five that make up the ring are nitrogen atoms. **2.** any of a class of antifungal agents that contain this compound.

tribe [L, *tribus*], a taxonomic division of organisms, subordinate to a family and superior to a genus, or subtribe.

-tribe, suffix meaning a "surgical instrument used to crush a body part": *cephalotribe, sphenotribe, vasotribe.*

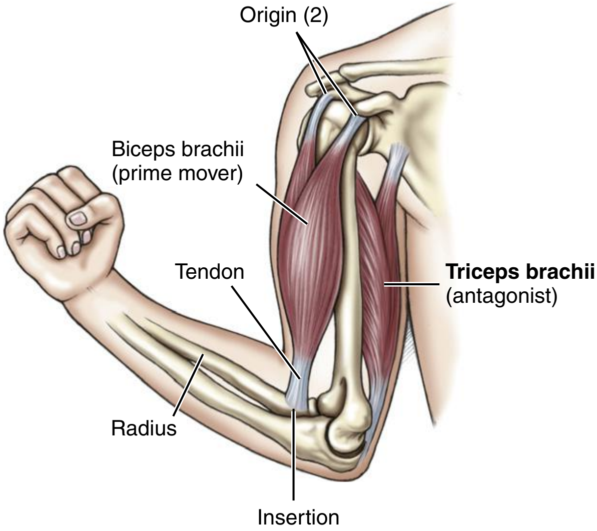
tribology /tribol′əjē/ [Gk, *tribo,* to rub, *logos,* science], the study of friction, wear, and lubrication of articulating surfaces.

TRIC /trik/, abbreviation for *trachoma inclusion conjunctivitis* agent, which refers to *Chlamydia trachomatis,* the organism that causes both inclusion conjunctivitis and trachoma. See also ***Chlamydia.***

tricarboxylic acid cycle. See **citric acid cycle.**

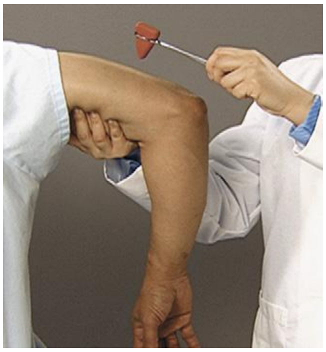
TRICARE, a health care insurance system for military dependents and members of the military services that covers care not available through the usual U.S. military medical service or public health service facilities. CHAMPUS was the first federal third-party reimbursement system to pay for care rendered by nurse-midwives and nurse practitioners. Formerly called **Civilian Health and Medical Programs for Uniformed Services.**

triceps brachii /trī′seps brak′ē·ī/ [L, three-headed, *brachium,* arm], a large muscle that extends the entire length of the posterior surface of the humerus. Proximally it has a long head, a lateral head, and a medial head. The three parts of the muscle converge in a long tendon and insert in the posterior aspect of the olecranon. It functions to extend the forearm and to adduct and extend the arm. Also called **triceps.** Compare **biceps brachii.**



Triceps brachii *(Herlihy, 2011)*

triceps reflex, a deep tendon reflex elicited by tapping sharply the triceps tendon proximal to the elbow with the forearm in a relaxed position. The response is a definite extension movement of the forearm. The reflex is accentuated by lesions of the pyramidal tract above the level of the seventh or eighth vertebra. See also **deep tendon reflex.**



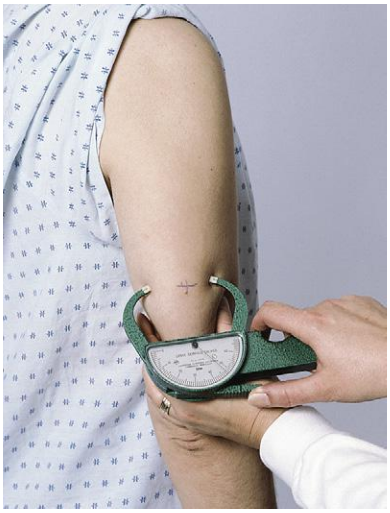
Triceps reflex test *(Seidel et al, 2011)*

triceps skinfold (TSF), the thickness of a fold of skin around the triceps muscle. It is measured primarily to estimate the amount of subcutaneous fat.

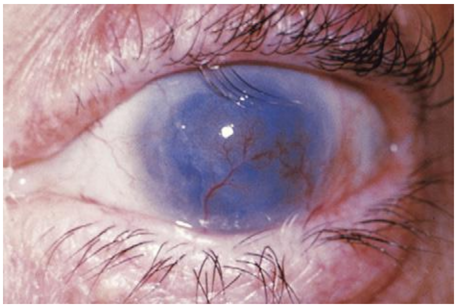
triceps surae limp, an abnormal action in the walking or gait cycle, associated with a deficiency in the elevating and propulsive factors on the affected side of the body, especially a deficiency of the triceps surae. Such a deficiency prevents the triceps surae from raising the pelvis and carrying it forward during the walking cycle. The pelvis consequently sags below its normal level and lags behind in the walking movement.

trichi-, tricho-, -trichia, -trichosis, combining forms meaning "hair", *trichinosis, trichophagia, glossotrichia.*

trichiasis /trikī′əsis/ [Gk, *thrix*, hair, *osis*, condition], an abnormal inversion of the eyelashes that irritates the eyeball. It usually follows infection or inflammation. Compare **ectropion.**



Triceps skinfold measurement *(Seidel et al, 2011)*



Trichiasis in late trachoma *(Stone and Gorbach, 2000)*

trichinosis /trik′inō′sis/ [Gk, *thrix* + *osis*, condition], infestation with the parasitic roundworm *Trichinella spiralis*, transmitted by eating raw or undercooked meat containing cysts (pork, bear, or other wild game). Early symptoms of infection include abdominal pain, nausea, fever, and diarrhea. Later, muscle pain, tenderness, fatigue, and eosinophilia are observed. Light infections may be asymptomatic. Also called *trichinellosis, trichiniasis.*

■ OBSERVATIONS: Encysted larvae in improperly cooked pork mature in the intestines of the host, with mature worms depositing their larvae in the intestinal wall. The larvae penetrate the intestinal mucosa and move to other parts of the body through the blood and lymphatic systems, ultimately invading skeletal muscles, especially the diaphragm and the chest muscles, where they encyst. Larval penetration of the brain or heart may result in death. Serological tests, skin sensitivity tests, and microscopic examination of specimens of infested muscle obtained by a biopsy often contribute to the diagnosis.

■ INTERVENTIONS: There is no specific treatment. Analgesics, thiabendazole, and corticosteroids may relieve symptoms. Bed rest is recommended to prevent relapse and possible death. After 2 or 3 months, the organisms are completely encysted and cause no further symptoms.

trichiuriasis. See **trichuriasis.**

trichlorfon /tri-klor′fon/, metrifonate. Also spelled *trichlorphon.*

trichlormethiazide /trīʹklôrməthīʹəzīd/, a thiazide diuretic. The prototype is hydrochlorothiazide.

■ INDICATIONS: It is prescribed in the treatment of hypertension and edema.

■ CONTRAINDICATIONS: Anuria or known hypersensitivity to this drug, to thiazide medications, or to sulfonamide derivatives prohibits its use.

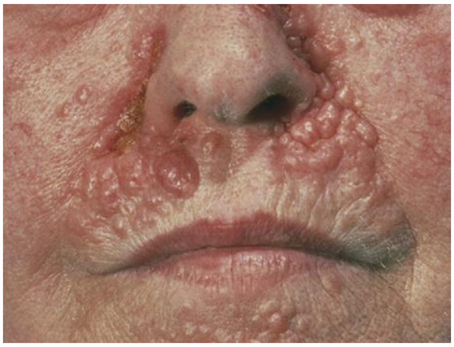
■ ADVERSE EFFECTS: Among the more serious adverse effects are hypokalemia, hyperglycemia, hyperuricemia, and various hypersensitivity reactions.

trichloroethylene /trīklôrʹō·ethʹilēn/, a general anesthetic, administered by mask with N_2O, for dentistry, minor surgery, and the first stages of labor. It is too cardiotoxic for deep anesthesia, even in light planes of anesthesia. It is not currently used in clinical anesthesia practice in developed countries.

tricho-. See **trichi-.**

trichobasalioma hyalinicum. See **cylindroma,** def. 2.

trichoepithelioma /trikʹō·epʹithēʹlē·ōʹmə/ *pl.* **trichoepitheliomas, trichoepitheliomata** [Gk, *thrix* + *epi,* above, *thele* nipple, *oma,* tumor], a cutaneous tumor derived from the basal cells of the follicles of fine body hair. One form of trichoepithelioma is an inherited condition and usually occurs as multiple growths. Also called **acanthoma adenoides cysticum, epithelioma adenoides cysticum.**



Trichoepithelioma

(Hordinsky, Sawaya, and Scher, 2000)

trichoid /trikʹoid/, resembling a hair.

trichologia /trikʹəlōʹjē·ə/ [Gk, *thrix* + *legein,* to pull], an abnormal condition in which a person pulls out his or her own hair, which may be seen in delirium.

trichology /trikolʹəjē/, the study of the anatomy, development, and diseases of the hair.

trichomania. See **trichotillomania.**

trichomatous /trikomʹətəs/ [Gk, *trichoma,* hairy growth], **1.** pertaining to an introversion of the margin of the eyelid. **2.** pertaining to matted hair or ingrowing hair.

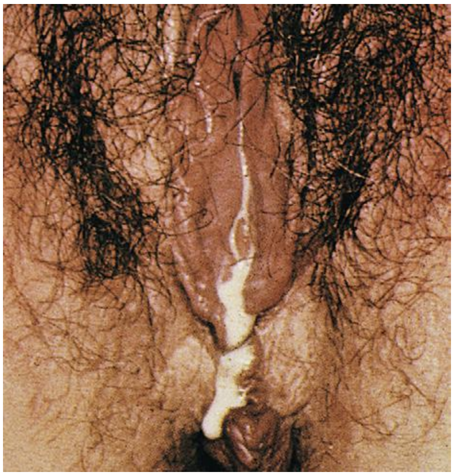
trichomonacide /trikʹōmonʹəsīd/ [Gk, *thrix* + *monas,* unit; L, *caedere,* to kill], an agent destructive to *Trichomonas vaginalis,* a parasitic protozoan flagellate that causes a refractory type of vaginitis, cystitis, and urethritis. Metronidazole is used in the treatment of women with trichomoniasis and their asymptomatic partners. **—trichomonacidal,** *adj.*

Trichomonas /trikʹəmonʹəs/, a genus of flagellate protozoa that includes many species that are parasitic. Some live in the mouth of humans and are found around carious teeth. Other species are found in the vagina and urethra of women. They are a cause of trichomoniasis.

Trichomonas tenax, a species of protozoa that is found in the human mouth, particularly in cases of pyorrhea.

Trichomonas vaginalis [Gk, *thrix* + *monas* + L, *vagina,* sheath], a motile protozoan parasite that causes vaginitis with a copious malodorous discharge and pruritus. See also **trichomoniasis.**

trichomoniasis /trikʹəmənīʹəsis/ [Gk, *thrix* + *monas* + *osis,* condition], a vaginal infection caused by the protozoan *Trichomonas vaginalis.* It is characterized by itching; burning; and frothy, pale yellow to green, malodorous vaginal discharge. With chronic infection all symptoms may disappear, although the organisms are still present. In men, infection is usually asymptomatic but may be evidenced by a persistent or recurrent urethritis. Infection is transmitted by sexual intercourse, (rarely) by moist washcloths, or, in newborns, by passage through the birth canal. Diagnosis is by microscopic examination of fresh vaginal secretions. Treatment is by oral metronidazole and tinidazole. Reinfection is common if sexual partners are not treated simultaneously.



Trichomoniasis

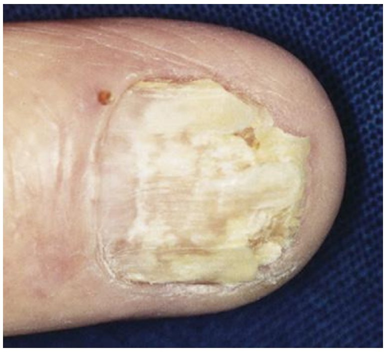
(Zitelli and Davis, 2007/Courtesy Dr. Ellen Wald, University of Wisconsin Children's Hospital)

trichopathy /trikopʹəthē/ [Gk, *thrix,* hair, *pathos,* disease], any disease condition involving the hair.

trichophagia /trikʹo-faʹjah/, the habit of eating hair, a form of pica.

trichophytic granuloma. See **Majocchi's granuloma.**

Trichophyton /trikofʹiton/ [Gk, *thrix* + *phyton,* plant], a genus of fungi that infects skin, hair, and nails. See also **dermatomycosis, dermatophyte.**



Trichophyton rubrum

(Hordinsky, Sawaya, and Scher, 2000/Courtesy Dr. J. Del Russo)

trichosis /trikō′sis/ [Gk, *thrix*, hair, *osis*, condition], any abnormal condition of hair growth, including alopecia, excessive female hair growth, or abnormal hair color.

-trichosis. See **trichi-.**

trichosporosis [Gk, *thrix,* hair, *spora,* seed, *osis,* condition], a fungus disease of the hair shaft, giving the hair a metallic appearance and caused by *Trichosporon beigelii*. Also called **white piedra.** See also **piedra.**

trichostrongyliasis /trik′ōstron′jəlī′əsis/ [Gk, *thrix* + *strongylos,* round, *osis,* condition], infestation with *Trichostrongylus,* a genus of nematode worm. Also called *trichostrongylosis*. See also **nematode.**

Trichostrongylus /trik′ōstron′jiləs/ [Gk, *thrix* + *strongylos*], a genus of roundworm, some species of which are parasitic to humans, such as *T. orientalis*. See also **trichostrongyliasis.**

trichotillomania /trik′ōtil′ōmā′nē·ə/ [Gk, *thrix* + *tillein,* to pull, *mania,* madness], an impulse disorder characterized by a desire to pull out one's hair, frequently seen in cases of severe mental retardation and delirium. Also called **hair pulling, trichomania.** See also **trichologia. —trichomanic, trichotillomanic,** *adj*.

trichromacy /tri-kro′mah-se/, trichromatic vision.

trichromatic /tri′kro-mat′ik/, **1.** having or pertaining to three different colors. **2.** able to distinguish the three primary colors. See *trichromatic vision*.

trichromatism /tri-kro′mah-tiz'm/, trichromatic vision.

trichuriasis /trik′yərī′əsis/ [Gk, *thrix* + *oura,* tail, *osis,* condition], infestation with the roundworm *Trichuris trichiura*. The condition is usually asymptomatic, but heavy infestation may cause nausea, abdominal pain, diarrhea, and, occasionally, anemia and rectal prolapse. It is common in tropical areas with poor sanitation. Eggs are passed in feces. Contamination of the hands, food, and water results in ingestion of the eggs, which hatch in the intestines where the adult worms embed two thirds of their length in the intestinal mucosa. The worms may live 15 to 20 years. Treatment is with mebendazole; prevention includes proper disposal of feces and good personal hygiene. Also called **trichiuriasis** /trik′ē-/.

Trichuris /trikyŏŏr′is/ [Gk, *thrix* + *oura*], a genus of parasitic roundworms of which the species *T. trichiura* infects the intestinal tract. Adult worms, which are 30 to 50 mm long, resemble a whip, with a threadlike anterior and a thicker posterior. Also called **whipworm.** See also **trichuriasis.**

Trichuris trichiura, a species of whipworms, commonly found in warm, moist regions of the world. Ingestion of whipworm eggs results in infection in humans. The parasites live mainly in the cecum or large intestine. Heavy infections cause abdominal pain and diarrhea. Very heavy infections may result in anemia because of intestinal blood loss.

tricitrates /tri-sit′rāts/, a solution of sodium citrate, potassium citrate, and citric acid. It is used as a systemic or urinary alkalizer and neutralizing buffer and for prevention of kidney stones.

trick knee. See **locked knee.**

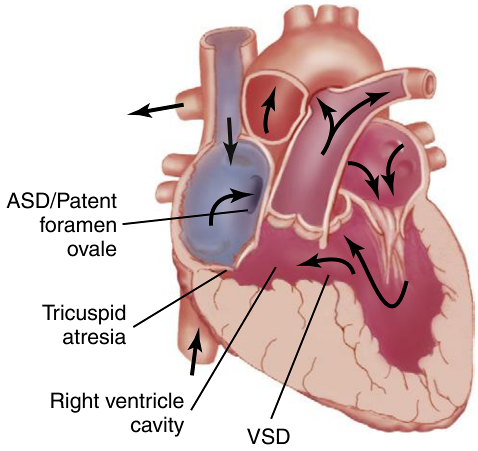
triclosan /tri-klo′san/, an antibacterial effective against gram-positive and most gram-negative organisms and exhibiting slight activity against yeasts and fungi. It is used as a detergent in surgical scrubs, soaps, and deodorants.

tricrotic pulse /trīkrot′ik/, an abnormal pulse that has three peaks of elevation on a sphygmogram, representing the pressure wave from the heart in systole followed by two pressure waves in diastole.

tricuspid /trīkus′pid/ [Gk, *treis,* three; L, *cuspis,* point], **1.** *adj,* pertaining to three points or cusps. **2.** *adj,* pertaining to the tricuspid valve of the heart. **3.** *n,* a tooth with three points or cusps, rare in humans. Also called *tricuspal,* **tri-dent, tridentate.**

tricuspid area [Gk, *treis,* three; L, *cuspis,* point], the region of the chest near the left lower sternum and opposite the fourth and fifth costal cartilages, where sounds of the tricuspid heart valve are best heard by auscultation. Also called **tricuspid-valve area.**

tricuspid atresia, a congenital cardiac anomaly characterized by the absence of the tricuspid valve so that there is no opening between the right atrium and right ventricle. Other cardiac defects, such as atrial and ventricular septal defects, are usually present, allowing some shunting of blood into the lungs. Clinical manifestations include severe cyanosis, dyspnea, anoxia, and signs of right-sided heart failure. Definitive diagnosis is made by cardiac catheterization, although radiographic studies usually reveal a small, underdeveloped right ventricle and large atria, giving the heart a round shape, and decreased pulmonary vascularity. Immediate palliative treatment includes pulmonary artery anastomoses to increase blood flow to the lungs and atrial septostomy if the atrial septal defect is small. Total corrective surgery has been successful in a limited number of older children.



Tricuspid atresia *(James and Ashwill, 2007)*

tricuspid insufficiency, incomplete closure of the tricuspid valve, resulting in tricuspid regurgitation.

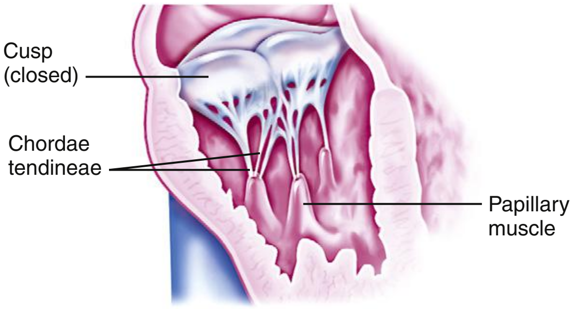
tricuspid murmur [Gk, *treis,* three; L, *cuspis,* point, *murmur,* humming], one of the heart murmurs caused by a defective tricuspid valve. The tricuspid diastolic and systolic murmurs resemble mitral valve diastolic and systolic murmurs.

tricuspid oriface. See **right atrioventricular orifice.**

tricuspid regurgitation (TR) [Gk, *treis,* three; L, *cuspis,* point + *re, gurgitare,* again to flow back], the backflow of blood from the right ventricle into the right atrium, resulting from imperfect functioning (insufficiency) of the tricuspid valve.

tricuspid stenosis, narrowing or stricture of the tricuspid valve. It is relatively uncommon and usually associated with lesions, caused by rheumatic fever, of other valves. Clinical characteristics include a diastolic pressure gradient between the right atrium and right ventricle, jugular vein distension, pulmonary congestion, and, in severe cases, hepatic congestion and splenomegaly.

tricuspid valve, a valve with three main cusps situated between the right atrium and right ventricle of the heart. The cusps of the tricuspid valve include the ventral, dorsal, and medial cusps. The cusps are composed of strong fibrous tissue and are anchored to the papillary muscles of the right ventricle by several tendons. As the right and left ventricles relax during the diastolic phase of the heartbeat, the tricuspid valve opens, allowing blood to flow into the ventricle. In the systolic phase of the heartbeat, both blood-filled ventricles contract, pumping out their contents, while the tricuspid and mitral valves close to prevent any backflow. Also called **right atrioventricular valve.** Compare **aortic valve, mitral valve, pulmonary valve, semilunar valve.** See also **atrioventricular valve, heart valve.**



Tricuspid valve

tricuspid-valve area. See **tricuspid area.**

tricyclic antidepressant (TCA), any of a group of antidepressant drugs that contain three fused rings in their chemical structure and that potentiate the action of catecholamines. These drugs rapidly block the reuptake of amine neurotransmitters, but the exact mechanism of their effect is unknown because a period of time is required for the beneficial antidepressant effects to appear. The tricyclic antidepressants include a number of compounds, which may be grouped into four classes on the basis of chemical structure: dibenzazepines, dibenzocycloheptadienes, dibenzoxazepines, and dibenzoxepines. Besides their use to treat depression, various tricyclic antidepressants are used for other conditions, such as obsessive-compulsive disorder, panic disorder, and neurogenic pain.

tricyclic compound /trīsik′lik/ [Gk, *treis* + *kyklos,* circle; L, *componere,* to put together], a chemical substance containing three rings in the molecular structure, especially a tricyclic antidepressant drug used in the treatment of reactive or endogenous depression. These drugs also have anticonvulsant, antihistaminic, anticholinergic, hypotensive, and sedative effects. See also **antidepressant.**

trident, tridentate. See **tricuspid.**

Tridesilon, a trademark for a glucocorticoid **(desonide).**

Tridione, a trademark for an anticonvulsant **(trimethadione).**

trientene /tri′en-tēn/, a chelating agent used as the hydrochloride salt for chelation of copper in treatment of Wilson's disease; administered orally.

trientine hydrochloride /trī·en′tēn/, an oral medication for treatment of an inherited defect in copper metabolism (Wilson's disease).

■ INDICATIONS: It is prescribed for the relief of symptoms of Wilson's disease for people who cannot tolerate penicillamine.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: The most serious side effects are possible iron deficiency and hypersensitivity reactions.

triethanolamine polypeptide oleate-condensate /trī·eth′ənol′əmēn/, a ceruminolytic agent prescribed to reduce excessive earwax, used as a solution in propylene glycol. A possible serious adverse effect is severe contact dermatitis.

trifacial nerve. See **trigeminal nerve.**

trifluoperazine hydrochloride /trī′flo͞o·ōper′əzēn/, a phenothiazine antipsychotic.

■ INDICATIONS: It is prescribed in the treatment of schizophrenia and other psychoses.

■ CONTRAINDICATIONS: Concurrent administration of central nervous system depressants, coma, hepatic or renal dysfunction, severe hypotension, blood dyscrasias, or known hypersensitivity to this drug prohibits its use. It must be used with caution in patients with Parkinson's disease.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, hepatotoxicity, extrapyramidal reactions, blood dyscrasias, and hypersensitivity reactions.

trifluorothymidine /trīflo͝or′ōthī′mədēn/, an antiviral.

■ INDICATIONS: It is prescribed in the treatment of keratoconjunctivitis, herpetic keratitis, and other forms of keratitis caused by herpes simplex virus.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Ocular toxicity may result from continued use beyond 21 days.

■ ADVERSE EFFECTS: Among the more serious adverse effects are hypersensitivity reactions, stromal edema, and increased ocular pressure.

trifocal lens /trīfō′kəl/ [Gk, *treis,* three; L, *focus,* hearth, *lens,* lentil], an eyeglass lens ground with three foci to allow correction of near, intermediate, and far vision.

trifurcation /-furkā′shən/ [Gk, *treis,* three; L, *furca,* fork], pertaining to a vessel or other structure with three branches.

trigeminal /trījem′inəl/ [Gk, *treis,* three; L, *geminus,* twins], **1.** pertaining to the three-branch trigeminal (fifth cranial) nerve innervating the face, eyes, nose, mouth, and jaws. **2.** See **trigeminy.**

trigeminal nerve [Gk, *treis* + *geminus,* twin], either of the largest pair of cranial nerves, essential for the act of chewing and general sensibility of the face. The trigeminal nerves have sensory, motor, and intermediate roots and connect to three areas in the brain. Also called **fifth cranial nerve, nervus trigeminus, trifacial nerve, trigeminus.**

trigeminal neuralgia, a neurological condition of the trigeminal facial nerve, characterized by paroxysms of flashing, stablike pain radiating along the course of a branch of the nerve from the angle of the jaw. It is caused by degeneration of the nerve or by pressure on it. Any or all of the three branches of the nerve may be affected. Neuralgia of the first branch results in pain around the eyes and over the forehead; of the second branch, in pain in the upper lip, nose, and cheek; of the third branch, in pain on the side of the tongue and the lower lip. The momentary bursts of pain recur in clusters lasting many seconds. Paroxysmal episodes of the pains may last for hours. Also called **prosopalgia, tic douloureux.**

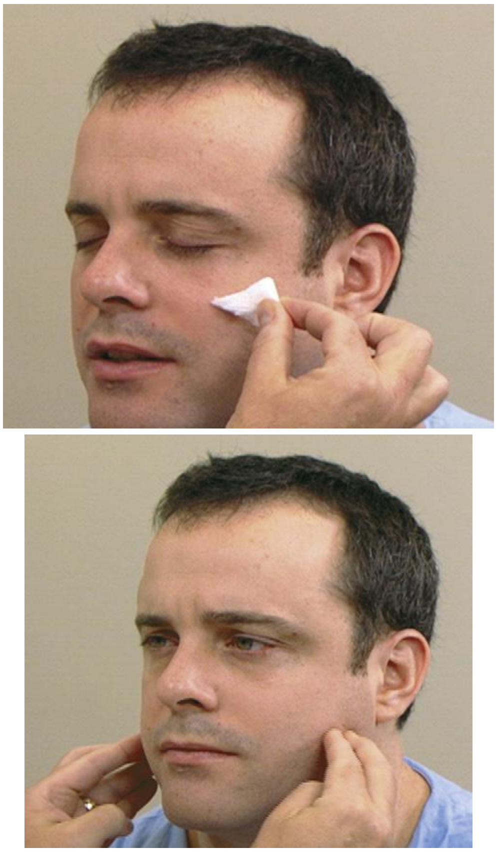
trigeminal pulse, an abnormal pulse in which every third beat is absent. See also **bigeminal pulse, trigeminy.**

trigeminus. See **trigeminal nerve.**

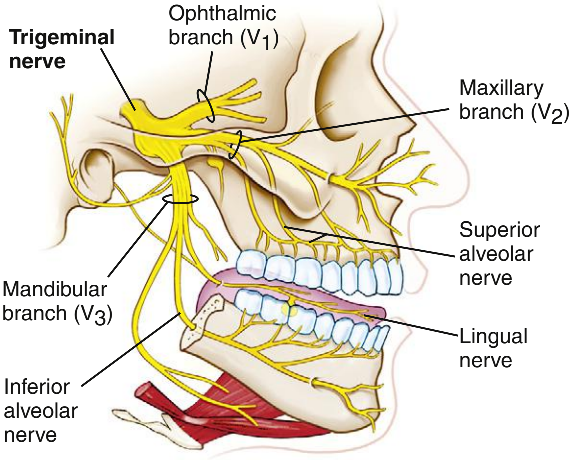
trigeminy /trījem′inē/ [Gk, *treis* + L, *geminus,* twin], **1.** a grouping in threes. **2.** a cardiac arrhythmia characterized by the occurrence of three heartbeats in a repeating pattern: two normal beats coupled to an ectopic beat, or two ectopic beats coupled to a normal beat. **—trigeminal,** *adj.*

trigger [D, *trekker,* that which pulls], a substance, object, or agent that initiates or stimulates an action.

triggered activity [D, *trekker,* that which pulls; L, *activus*], rhythmic cardiac activity that results when a series of after-depolarizations reach the threshold potential.



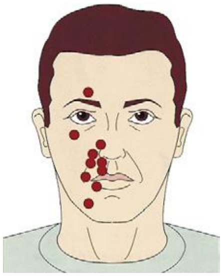
Assessment of trigeminal nerve *(Swartz, 2009)*



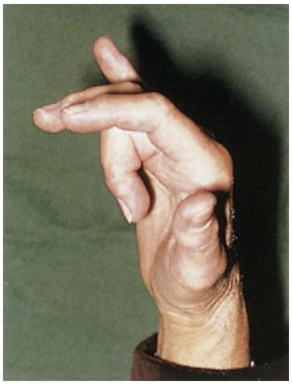
Trigeminal nerve

trigger finger, a phenomenon in which the movement of a finger is halted momentarily in flexion or extension and then continues with a jerk. Also called **jerk finger.**

trigger point, a point on the body that is particularly sensitive to touch and, when stimulated, becomes the site of a painful neuralgia. Also called *trigger zone*.



Trigeminal neuralgia: distribution of trigger zones
(Perkin, 2002)



Trigger finger, locked position
(Moll, 1997)

triglyceride /trīglis′ərīd/, a simple fat compound consisting of three molecules of fatty acid (e.g., oleic, palmitic, or stearic) and glycerol. Triglycerides make up most animal and vegetable fats and are the principal lipids in the blood, where they circulate within lipoproteins. The total amount of triglyceride and the amount, proportion, and kinds of lipoproteins are important in the diagnosis and treatment of many diseases and conditions, including diabetes, hypertension, and heart disease. Normally the total amount of triglyceride in the blood does not exceed 200 to 300 mg/dL. For improved metabolic health and protection to the heart and blood vessels, the American Heart Association recommends an optimum fasting triglyceride level of 100 mg/dL.

triglycerides test (TGs), a blood test that detects levels of fats existing within the bloodstream that are transported by very low-density lipoproteins (VLDLs) and chylomicrons. It is done as part of a lipid profile, which also evaluates cholesterol and lipoproteins to assess the risk of coronary and vascular disease.

trigonal muscles, a submucous sheet of smooth muscle at the bladder base (trigone), continuous with ureteral muscles above and with those of the proximal urethra below. Its superficial and deep layers are morphologically distinct.

trigone /trī′gōn/ [Gk, *trigonos*, three-cornered], **1.** a triangular space, especially one at the base of the shoulder. **2.** the first three dominant cusps, considered collectively, of an upper molar.

trigonelline /trig′ōnel′ēn/, an alkaloid derived from various kinds of plant products, including coffee beans, fenugreek, and seeds of *Cannabis sativa*, as well as from sea urchins and jellyfish. Trigonelline is used in the manufacture of poultices and other medicinals.

trigone of the bladder /trīgō′n/, a triangular area of the bladder between the opening of the ureters and the orifice of the urethra. Also called **trigonum vesicae.**

trigonitis /trī′gənī′tis/, inflammation of the trigone of the bladder, which often accompanies urethritis.

trigonum vesicae. See **trigone of the bladder.**

trihexyphenidyl hydrochloride /trīhex′ifen′idil/, an anticholinergic agent.

■ INDICATIONS: It is prescribed in the treatment of Parkinson’s disease and to control drug-induced extrapyramidal reactions.

■ CONTRAINDICATIONS: Narrow-angle glaucoma, asthma, obstruction of the genitourinary or GI tract, severe ulcerative colitis, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blurred vision, central nervous system effects, tachycardia, dry mouth, decreased sweating, and hypersensitivity reactions.

trihybrid /trīhī′brid/ [Gk, *treis* + *hybrida,* mixed offspring], pertaining to an individual, organism, or strain that is heterozygous for three specific traits; the offspring of parents differing in three specific gene pairs or that is heterozygous for three particular traits or gene loci being followed.

trihybrid cross, the mating of two individuals, organisms, or strains that have different gene pairs that determine three specific traits or in which three particular characteristics or gene loci are being followed.

trihydric alcohol /trīhid′rik/, an alcohol containing three hydroxyl groups. An example is **glycerin.**

triiodothyronine (T_3) /trī′ī·ō′dōthī′rənēn/, a hormone that helps regulate growth and development, helps control metabolism and body temperature, and, by a negative-feedback system, acts to inhibit the secretion of thyrotropin by the pituitary gland. Triiodothyronine is produced mainly from the deiodination of thyroxine in the peripheral tissues but is also synthesized by and stored in the thyroid gland as an amino acid residue of the protein thyroglobulin. Triiodothyronine circulates in the plasma, where it is bound mainly to thyroxine-binding globulin and thyroxine-binding prealbumin, proteins that protect the hormone from metabolism and excretion during its half-life of 2 days or less before it is degraded in the liver. The hormone is the most active thyroid hormone and affects all body processes, including gene expressions. It is a component of various drugs, such as liotrix and liothyronine sodium, used in the treatment of hypothyroidism and simple goiter. Normal adult blood levels are 110 to 230 ng/dL. See also **thyroid hormone.**

triiodothyronine resin uptake test, a thyroid function test measuring how many sites on **thyroxine-binding globulin** are occupied by endogenous triiodothyronine (T_3) and how many sites remain available. An excess of radioactive exogenous T_3 is added to the sample, followed by the addition of a resin that also binds T_3. A portion of the radioactive T_3 binds to sites on TBG not already occupied by endogenous thyroid hormones, and the remainder binds to the resin. The amount of labeled hormones bound to the resin (the T_3 resin uptake) can be subtracted from the total that was added, and the remainder is the amount that was bound to the unoccupied binding sites on the TBG.

triiodothyronine (T_3) test, a test used to accurately measure thyroid function. Since nonthyroidal diseases can convert thyroxine to T_3 in the liver, and because there is considerable overlap between hypothyroid states and normal thyroid function, T_3 is less useful in indicating hypothyroid states. It is used primarily to determine hyperthyroidism.

trikates /tri′kāts/, a solution of potassium acetate, potassium bicarbonate, and potassium citrate used as a potassium supplement in the treatment and prevention of hypokalemia. It is administered orally.

Trilafon, a trademark for a phenothiazine antipsychotic **(perphenazine).**

trilaminar blastoderm /trīlam′inər/ [Gk, *treis* + L, *lamina,* plate; Gk, *blastos,* germ, *derma,* skin], the stage of embryonic development in which all three of the primary germ layers, the ectoderm, mesoderm, and entoderm, have formed. Compare **bilaminar blastoderm.**

trill [It, *trillare,* to make a ringing sound], a vibratory, quavering, warbling sound, as produced by human voice, birds, insects, or musical instruments.

trilogy of Fallot /tril′əjē, falō′/ [Etienne-Louis A. Fallot, French physician, 1850–1911 Gk, *treis* + *logos,* word;], a congenital cardiac anomaly consisting of pulmonary stenosis, interatrial septal defect, and right ventricular hypertrophy. For discussion of diagnosis and treatment, see **tetralogy of Fallot.**

trimalleolar fracture. See **Cotton’s fracture.**

trimester /trīmes′tər, trī′-/ [L, *trimestris,* three months], one of the three periods of approximately 3 months into which pregnancy is divided. The first trimester includes the time from the first day of the last menstrual period to the end of 12 weeks. The second trimester, closer to 4 months in length than 3, extends from the twelfth to the twenty-eighth week of gestation. The third trimester begins at the twenty-eighth week and extends to the time of delivery.

trimethadione /trī′methədī′ōn/, an anticonvulsant.

■ INDICATIONS: It is prescribed to prevent absence (petit mal) seizures, particularly seizures that are resistant to other therapies.

■ CONTRAINDICATIONS: Severe renal or hepatic impairment, blood dyscrasias, or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are exfoliative dermatitis, blood dyscrasias, and aplastic anemia. Sedation, diplopia, photophobia and hemeralopia (an inability to see as distinctly in bright light as in dim light) may occur.

trimethobenzamide hydrochloride /trīmeth′ōben′zəmīd/, an anticholinergic and antiemetic.

■ INDICATIONS: It is prescribed for the relief of postoperative nausea and vomiting and nausea and vomiting associated with gastroenteritis.

■ CONTRAINDICATIONS: Reye’s syndrome or known hypersensitivity to benzocaine-like local anesthetic or this drug prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects with high doses are drowsiness, allergic reactions, and extrapyramidal reactions. Adverse reactions are rare at usual dosages.

trimethoprim /trīmeth′əprim/, an antibacterial.

■ INDICATIONS: It is prescribed in the treatment of infections, particularly of the urinary tract, middle ear, and bronchi.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or megaloblastic anemia resulting from folate deficiency prohibits its use. It should not be used to treat streptococcal pharyngitis.

■ ADVERSE EFFECTS: Among the more serious adverse effects are blood dyscrasias and allergic, GI, and central nervous system disorders.

trimethoprim and sulfamethoxazole. See **sulfamethoxazole and trimethoprim.**

trimipramine maleate /trimip′rəmēn/, a tricyclic antidepressant.

■ INDICATIONS: It is prescribed in the treatment of depression.

■ CONTRAINDICATIONS: Concomitant use of a monoamine oxidase inhibitor within 14 days or known hypersensitivity to this drug prohibits its use. It is not given during recovery from myocardial infarction or to schizophrenic patients. It is not recommended for children.

■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation tachycardia, seizures, parkinsonism, blurred vision, hypotension, and aggravation of glaucoma.

Trimox, a trademark for an antibiotic (amoxicillin trihydrate).

Trimpex, a trademark for an antibacterial **(trimethoprim).**

Trinalin, a trademark for a fixed combination medication containing an antihistamine (azatadine) and a decongestant (pseudoephedrine).

trinucleotide. See **codon.**

triolein breath test, a breath test for pancreatic function. The fasting patient is administered triolein labeled with either carbon 13 or carbon 14, and levels of labeled carbon dioxide in the exhaled breath are subsequently measured at regular time intervals; low levels of carbon dioxide indicate inadequate pancreatic lipase, such as with a pancreatic disease or cystic fibrosis.

tripanosomal. See **trypanosome.**

tripelennamine hydrochloride /trī′pelen′əmēn/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of rhinitis and hypersensitivity reactions of the skin.

■ CONTRAINDICATIONS: Asthma, glaucoma, difficulty in emptying the bladder, concomitant administration of a monoamine oxidase inhibitor, or known hypersensitivity to this drug prohibits its use. It is not given to premature infants or newborns or to lactating mothers.

■ ADVERSE EFFECTS: Among the more serious adverse effects are sedation, tachycardia, and GI upset.

tripe palms, a condition of thickened velvet or moss-textured palms with pronounced skin ridge pattern. Tripe palms has been associated with certain malignancies, including lung and stomach cancers and pulmonary carcinomas.

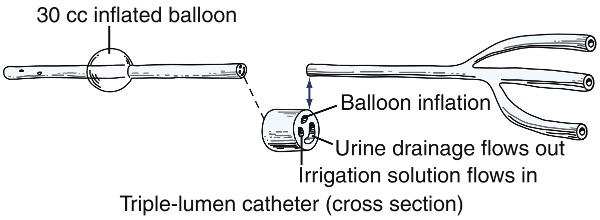
triphasic /trīfā′zik/ [Gk, *treis,* three, *phasis,* appearance], having three phases or stages.

triple-dye treatment, a therapy for burns in which three dyes, 6% gentian violet, 1% brilliant green, and 0.1% acriflavine base, are applied.

triplegia /trīplē′jə/ [Gk, *treis,* three, *plege,* stroke], a condition of paralysis on one side of the body plus paralysis of an arm or leg on the opposite side.

triple-lumen catheter [L, *triplus,* triple; L, *lumen,* light; Gk, *katheter,* a thing lowered into], any catheter with three separate passages, each of which is marked with the name of a fluid or medication. Some have infusion plugs and are flushed every 8 hours with a heparin or normal saline solution.

triple-lumen drain, a drain consisting of three tubes placed one inside another. One passage is for irrigation, one for drainage, and one for inflation of the bulb.



30 cc inflated balloon
Balloon inflation
Urine drainage flows out
Irrigation solution flows in
Triple-lumen catheter (cross section)

Triple-lumen catheter *(Perry, Potter, and Elkin, 2012)*

triple point, the combination of temperature and pressure in which a given substance may exist in solid, liquid, and vapor forms, all in equilibrium at the same time. Every substance has a theoretic triple point.

triple response, a triad of phenomena that occur in sequence after an intradermal injection of histamine. First, a red spot develops, spreading outward for a few millimeters, reaching its maximal size within 1 minute and then turning bluish. Next, a brighter red flush of color spreads slowly in an irregular flare around the original red spot. Finally, a wheal filled with fluid forms over the original spot. Also called *triple response of Lewis.*

triple sugar iron reaction, any one of several reactions seen in certain bacterial cultures growing on triple sugar iron agar, a culture medium used to aid in the identification of *Escherichia coli, Proteus, Salmonella, Shigella,* and other pathogenic enteric bacteria.

triple sulfa, a combination of sulfathiazole, sulfacetamide, and sulfabenzamide, administered intravaginally in the treatment of bacterial vaginosis caused by *Gardnerella vaginalis.*

triple sulfonamides. See **trisulfapyrimidines.**

triplet /trip′lit/ [L, *triplus*], **1.** any one of three offspring born of the same gestation period during a single pregnancy. See also **Hellin's law. 2.** (in genetics) the unit of three consecutive bases in one polynucleotide chain of deoxyribonucleic acid or RNA that codes for a specific amino acid. See also **codon, genetic code.**

triple X syndrome. See **XXX syndrome.**

triploid (3*n*) /trip′loid/ [L, *triplus* + *eidos*], **1.** *n,* an individual, organism, strain, or cell that has three complete sets of chromosomes, triple the haploid number characteristic of the species. In humans the triploid number is 69. It is found in rare cases of aborted or stillborn fetuses. Of triploid fetuses born alive, all are characterized by gross and multiple malformations; they live for only a few hours. **2.** *adj,* also *triploidic,* pertaining to such an individual, organism, strain, or cell. Compare **diploid, haploid, tetraploid.** See also **polyploid. —triploidy,** *n.*

triploidy /trip′loidē/, the state or condition of having three complete sets of chromosomes.

tripod /trī′pod/ [Gk, *treis,* three, *pous,* foot], any object with three legs or three feet.

tripodial symmelia /trīpō′dē·əl/ [Gk, *treis,* three, *pous,* foot, *syn,* together, *melos,* limb], a fetal anomaly characterized by the fusion of the lower extremities and the presence of three feet. Compare **dipodial symmelia, monopodial symmelia, sirenomelia.**

triprolidine /trī·prol′idēn/, an antihistamine.

■ INDICATIONS: It is prescribed in the treatment of hypersensitivity reactions, including rhinitis, skin rash, and pruritus.

■ CONTRAINDICATIONS: Asthma or known hypersensitivity to this drug prohibits its use. It is not given to newborns or lactating mothers. Adverse reactions may occur in elderly patients.

tripsis /trip′sis/ [Gk, rubbing], **1.** massage. **2.** the process of reducing the particle size of a substance by grinding it with a mortar and pestle. Also called **trituration.**

-tripsis, suffix meaning "to crush, break, or pulverize": *anatripsis, entripsis, syntripsis.*

-tripsy, suffix meaning "to crush, break, or pulverize": *basiotripsy, lithotripsy, sarcotripsy.*

triptorelin, a gonadotropin-releasing hormone used to treat advanced prostate cancer.

triradiate cartilage, a secondary ossification center of the hip bone, occurring as a Y-shaped strip in the floor of the acetabulum.

trisaccharide /trīsak′ərīd/ [Gk, *treis,* three, *sakcharon,* sugar], a carbohydrate composed of three monosaccharide units linked together.

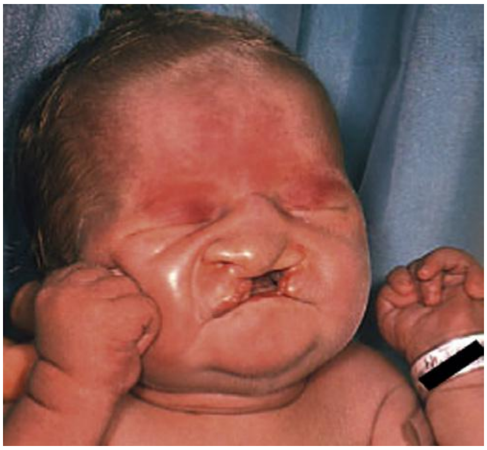
trisalicylate /tri′sah·lis′ilāt/, a compound containing three salicylate ions.

trismus /triz′məs/ [Gk, *trismos,* gnashing], a prolonged tonic spasm of the muscles of the jaw. Also called *(informal)* **lockjaw.** See also **tetanus.**

trisomy /trī′səmē/ [Gk, *treis* + *soma,* body], a chromosomal aberration characterized by the presence of one more than the normal number of chromosomes in a diploid complement. In humans the trisomic cell contains 47 chromosomes and is designated $2n + 1$. The additional member can join any of the normal homologous pairs, although most human trisomies involve the small chromosomes, such as those in the E or G group or the sex chromosomes. Partial trisomy occurs when only a part of a chromosome attaches to another. In genetic nomenclature, trisomies are indicated by the exact chromosome or karyotypic group in which the addition is made, such as trisomy 13 or trisomy D. Also called *trisomia.* Compare **monosomy.** See also **aneuploidy, multipolar mitosis, trisomy syndrome. —trisomic,** *adj.*

trisomy 8, a congenital condition associated with the presence of an extra chromosome 8 within the C group. Those with the condition are slender and of normal height and have a large asymmetric head, prominent forehead, deep-set eyes, low-set prominent ears, and thick lips. There is mild to severe mental and motor retardation, often with delayed and poorly articulated speech. Skeletal anomalies and joint limitation, especially permanent flexion of one or more fingers, may occur. There are unusually deep palmar and plantar creases, which are diagnostically significant. Most trisomy 8 individuals are mosaic, with no abnormal or only slight clinical manifestations, or they are only partially trisomic, with part of the extra chromosome 8 missing, and show varying degrees of the clinical symptoms. In general, trisomy 8 is a less severe condition than other trisomies, especially trisomy 13 and trisomy 18, so that mortality is low. Also called **trisomy C syndrome.**

trisomy 13, a congenital condition caused by the presence of an extra chromosome in the D group, predominantly chromosome 13, although in rare instances chromosome 14 or 15. It occurs in approximately 1 in 5000 births and is characterized by multiple midline anomalies and central nervous system defects, including holoprosencephaly, microcephaly, myelomeningocele, microphthalmos, and cleft lip and palate. There is also severe mental retardation; polydactyly; deafness; convulsions; and abnormalities of the heart, viscera, and genitalia. Most infants with the condition are severely affected and do not survive beyond the first 6 months of life. The symptom combination of cleft lip and palate, polydactylism, and microcephaly is sometimes identified as the triad. Also called **Patau's syndrome, trisomy D syndrome,** *trisomy 13-15.*



Trisomy 13: midline defect

(Lipson, 2005)

trisomy 18, a congenital condition caused by the presence of an extra chromosome 18, characterized by severe mental retardation and multiple deformities. Among the most common defects are scaphocephaly or other skull abnormalities; micrognathia; abnormal facies with low-set malformed ears and prominent occiput; cleft lip and palate; clenched fists with overlapping fingers, especially the index over the third finger; clubfeet; and syndactyly. Ventricular septal defect, patent ductus arteriosus, atrial septal defect, and renal anomalies are also common. The condition occurs in about 1 in 3000 births and predominantly in females, at a 3:1 sex ratio, and survival for more than a few months is rare. Also called **Edwards' syndrome, trisomy E syndrome,** *trisomy 16-18.*

trisomy 21. See **Down syndrome.**

trisomy 22, a congenital condition caused by the presence of an extra chromosome 22 in the G group, characterized by psychomotor retardation and various developmental anomalies. Common defects include microcephaly, micrognathia, hypotonia, hypertelorism, abnormal ears with preauricular tags or fistulas, and congenital heart disease. In partial trisomy 22 the extra chromosome is much smaller than the normal pair and causes coloboma of the iris, anal atresia, or both, as well as various other defects. See also **cat-eye syndrome.**

trisomy C syndrome. See **trisomy 8.**

trisomy D syndrome. See **trisomy 13.**

trisomy E syndrome. See **trisomy 18.**

trisomy syndrome, any condition caused by the addition of an extra member to a normal pair of homologous autosomes or to the sex chromosomes or by the translocation of a part of one chromosome to another. Most trisomies occur as a result of complete or partial nondisjunction of the chromosomes during cell division. The more severe conditions are related to trisomies of the autosomes rather than the sex chromosomes. The most common trisomy syndromes with clearly established clinical manifestations are trisomy 8, trisomy 13, trisomy 18, trisomy 21, and trisomy 22. See also **trisomy.**

trisplanchnic /trīsplangk′nik/, pertaining to three visceral body cavities: skull, thorax, and abdomen.

trisulfapyrimidines /trīsul′fəpirim′idīnz/, three antibacterials in combination (sulfadiazine, sulfamerazine, and sulfamethazine), rarely prescribed today. Also called **triple sulfonamides.**

tritium (^{3}H) /trit′ē·əm, trish′əm/ [Gk, *tritos,* third], the radioactive isotope of the hydrogen atom, used as a tracer; a beta emitter. See also **deuterium, protium.**

trituration, the process of removing impurities from a substance by grinding it under a solvent in which the impurities are much more soluble than the substance itself. See also **tripsis.**

trivalence /trīvā′ləns/ [Gk, *treis* + L, *valere,* to be worth], an ability of an atom or group of atoms to bond with three monovalent elements in a compound.

trivalent /trīvā′lənt/ [Gk, *treis* + L, *valere,* to be worth], **1.** pertaining to an atom or group of atoms with the capability of bonding with or replacing three monovalent elements. **2.** designating a vaccine that can prevent diseases or conditions.

trivial name /triv′ē·əl/, a chemical name that is not derived from a systematic nomenclature system such as the IUPAC nomenclature system. The name may or may not indicate its relationship to molecular structure and to other chemicals. The name may be accepted as an official nonproprietary designation because of common usage. Examples include caffeine, folic acid, and aspirin.

Tri-Vi-Flor, a trademark for an oral pediatric fixed-combination drug containing sodium fluoride and vitamins A, C, and D.

tRNA, abbreviation for **transfer RNA.**

Trobicin, a trademark for an antibacterial **(spectinomycin hydrochloride).**

trocar /trō′kär/ [Fr, *trois,* three, *carres,* sides], a sharp, pointed rod that fits inside a tube. It is used to pierce the skin and the wall of a cavity or canal in the body to aspirate fluids, to instill a medication or solution, or to guide the placement of a soft catheter. The trocar is usually removed, and the catheter, tube, or instrument is left in place. See also **cannula.**

trochanter /trōkan′tər/ [Gk, runner], one of the two bony projections on the proximal end of the femur that serve as the point of attachment of various muscles. The two protuberances are the trochanter major and the trochanter minor.

trochanteric fossa, a fossa on the greater trochanter to which the obturator externus muscle is attached.

trochanter major [Gk, *trochanter,* runner; L, *major,* great], a large projection from the proximal end of the shaft of the femur. It is a point of attachment for the gluteus minimus and gluteus medius muscles. Also called **greater trochanter.**

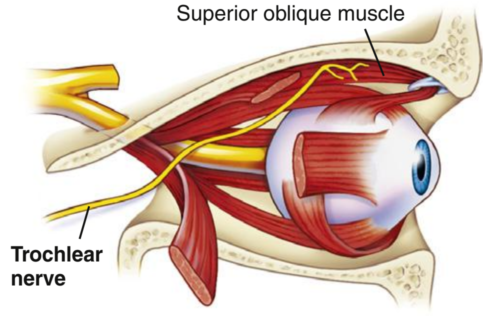
trochanter minor. See **lesser trochanter.**

troche /trō′kē/ [Gk, *trochos,* lozenge], a small oval, round, or oblong tablet containing a medicinal agent incorporated in a flavored, sweetened mucilage or fruit base that dissolves in the mouth, releasing the drug. Also called **lozenge, rotula,** *trochiscus.*

trochlea /trok′lē·ə/, a pulley-shaped part or structure.

trochlear /trok′lē·ər/ [L, *trochlea,* pulley], **1.** pertaining to a trochlea or something that is pulley shaped. **2.** relating to the trochlear (fourth cranial) nerve.

trochlear nerve [L, *trochlea,* pulley; *nervus,* nerve], either of the smallest pair of cranial nerves, essential for eye movement and eye muscle sensibility. The trochlear nerves branch to supply the superior oblique muscle and communicate with the ophthalmic division of the trigeminal nerve, connecting with two areas in the brain. Also called **fourth cranial nerve, nervus trochlearis.**



Trochlear nerve

trochlear notch of ulna, a large depression in the ulna, formed by the olecranon and coronoid processes, that articulates with the trochlea of the humerus.

trochoid joint. See **pivot joint.**

trolamine /trol′əmēn/, a contraction for *triethanolamine.*

troleandomycin /trol′ē·an′dōmī′sin/, a macrolide antibiotic.

■ INDICATIONS: It is prescribed in the treatment of certain infections, including pneumococcal pneumonia and group A streptococcal infections of the upper respiratory tract. It has orphan drug status for the treatment of corticosteroid-dependent asthma due to its steroid-sparing properties.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug or concomitant use of ergot alkaloids prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are GI disturbances, mild to severe allergic reactions (including anaphylaxis), and hepatotoxicity.

Trombiculidae /trom′bikyo͞o′lidē/, a family of mites, including harvest mites, red bugs, and chiggers. The larvae are parasitic and the adults are free-living. The mites are disease vectors of typhus, rickettsiae, scrub itch, tsutsugamushi disease, and other infections.

trombiculosis /trombik′yəlō′sis/ [Gk, *tromein,* to tremble, *osis,* condition], an infestation with mites of the genus *Trombicula,* some species of which carry scrub typhus.

-tron, suffix meaning a "(specified) type of vacuum tube": *dynatron, magnetron, thyratron.*

Tronothane, a trademark for a local anesthetic **(pramoxine hydrochloride).**

trop-, -trop, combining form for atropine derivatives.

trop-, tropo-, prefix meaning "turn, turning" or "tendency, affinity": *tropism, tropomyosin.* See also **tropho-,** with which this combining form is sometimes confused.

-tropal. See **-tropia.**

-trope, suffix meaning "influencing or influenced by": *gonadotrope, heliotrope, rheotrope.*

troph-. See **tropho-.**

-troph, **1.** suffix meaning "that which nourishes an embryo": *embryotroph, hemotroph, histotroph.* **2.** suffix meaning an "organism that gets nourishment from a (specified) source": *autotroph, metatroph, prototroph.*

trophectoderm. See **trophoblast.**

trophic /trof′ik/ [Gk, *trophe,* nutrition], pertaining to a nutritive effect on or quality of cellular activity.

-trophic, suffix meaning "a type of nutrition or nutritional requirement": *chondrotrophic, lipotrophic, viscerotrophic.*

trophic action [Gk, *trophe,* nutrition; L, *agere,* to do], the stimulation of cell reproduction and enlargement by nurturing and causing growth.

trophic fracture, a fracture resulting from the weakening of bone, caused by nutritional disturbances.

trophic hormones, hormones secreted by the adenohypophysis (anterior lobe of pituitary gland) that stimulate target organs.

trophic ulcer, a pressure ulcer caused by external trauma to a part of the body that is in poor condition because of disease, vascular insufficiency, or loss of afferent nerve fibers. Trophic ulcers may be painless or associated with severe causalgia. See also **pressure ulcer.**

trophism /trof′izəm/ [Gk, *trophe,* nutrition], the influence of nourishment.

tropho- /trof′ə-, trō′fə-/, prefix meaning "food or nourishment": *trophoblast, trophoedema, trophoneurosis.* See also **trop-.**

trophoblast /trof′əblast′/ [Gk, *trophe* + *blastos,* germ], the outermost layer of tissue that forms the wall of the blastocyst of placental mammals in the early stages of embryonic development. It functions in the implantation of the blastocyst in the uterine wall and in supplying nutrients to the embryo. At implantation the cells differentiate into two layers: the inner cytotrophoblast, which forms the chorion, and the syncytiotrophoblast, which develops into the outer layer of the placenta. Also called **trophectoderm. —trophoblastic,** *adj.*

trophoblastic cancer /-blas′tik/, a malignant neoplastic disease of the uterus derived from chorionic epithelium, characterized by the production of high levels of human chorionic gonadotropin (HCG). The tumor may be an invasive hydatid mole (chorioadenoma destruens) formed by grossly enlarged vesicular chorionic villi or a malignant uterine choriocarcinoma that arises from nonvillous chorionic epithelium. One half of the cases of choriocarcinoma follow a molar pregnancy, 25% an abortion, 22.5% a normal pregnancy, and 2.5% an ectopic pregnancy. A hydatid mole invades the myometrium and often forms extrauterine nodules that may spread to distant sites. Choriocarcinoma forms a dark red hemorrhagic nodular tumor on or in the uterine wall and metastasizes early in its course to the lungs, brain, liver, bones, vagina, or vulva. Initial symptoms are vaginal bleeding and a profuse, foul-smelling discharge; a persistent cough or hemoptysis signals pulmonary involvement. As the disease progresses, there may be frequent hemorrhage, weakness, and emaciation. Diagnostic measures include serial assays to determine whether the HCG level in the blood is elevated and histological examination of specimens obtained by curettage. Hysterectomy is indicated in most cases, but surgery does not eliminate the possibility of a recurrence. Chemotherapy is effective in curing a large percentage of patients with trophoblastic tumors. Also called *trophoblastic disease.* See also **choriocarcinoma, hydatid mole.**

trophotropic /trof′ətrop′ik/ [Gk, *trophe* + *trepein,* to turn], pertaining to a combination of parasympathetic nervous system activity, somatic muscle relaxation, and cortical beta rhythm synchronization, such as in a resting or sleep state.

trophotropism /trof′ətrop′izəm/, movement toward or away from nutrient sources.

trophozoite /trof′əzō′īt/ [Gk, *trophe* + *zoon,* animal], an immature ameboid protozoon. Diseases in which trophozoites may be isolated by bacteriological studies include amebic dysentery, malaria, and trichomonas vaginitis. When fully developed, a trophozoite may be identified as a schizont.

-trophy, -trophia, suffix meaning a "condition of nutrition or growth": *cyotrophy, embryotrophy, lipotrophy.*

-tropia, -tropal, -tropic, -tropous, **1.** suffix meaning a "turn or deviation from normal": *anatropic, hemitropic, stereotropic.* **2.** suffix meaning a "tendency to have an influence on, or be influenced by": *corticotropic, pancreatropic, radiotropic.*

tropical acne /trop′ikəl/, a form of acne that is caused or aggravated by high temperature and humidity. It is characterized by large nodules or pustules on the neck, back, upper arms, and buttocks.

tropical medicine [Gk, *tropikos,* of the solstice; L, *medicina*], the branch of medicine concerned with the diagnosis and treatment of diseases commonly occurring in tropical and subtropical regions of the world, generally between 30 degrees north and south of the equator.

tropical sore. See **cutaneous leishmaniasis.**

tropical spastic paraparesis. See **chronic progressive myelopathy.**

tropical sprue, a malabsorption syndrome of unknown cause that is endemic in the tropics and subtropics. It is characterized by abnormalities in the mucosa of the small intestine, resulting in protein malnutrition and multiple nutritional deficiencies, often complicated by severe infection. Symptoms include diarrhea, anorexia, and weight loss. Megaloblastic anemia may result from folic acid and vitamin B_{12} deficiency. Treatment includes administration of antibiotics, particularly tetracycline; folic acid; iron; calcium; and vitamins A, D, K, and B complex; as well as a balanced diet high in protein and normal in fat content. See also **nontropical sprue.**

tropical typhus. See **scrub typhus.**

-tropin, suffix meaning "stimulating effect of a hormone or other substance on a target organ or system": *somatotropin.*

-tropism. See **-tropy.**

-tropo. See **-trop.**

tropocollagen /trop′əkol′əjən/ [Gk, *trepein,* to turn, *kolla,* glue, *genein,* to produce], fundamental units of collagen fibrils obtained by prolonged extraction of insoluble collagen with dilute acid.

tropomyosin /trop′əmī′əsin/ [Gk, *trepein* + *mys,* muscle], a protein component of sarcomere filaments, which, together with troponin, regulates interactions of actin and myosin in muscle contractions.

troponin /trō′pənin/ [Gk, *trepein,* to turn], a protein in the striated cell ultrastructure that modulates the interaction between actin and myosin molecules. It is believed to be part of the calcium-binding complex of the thin myofilaments. See also **tropomyosin.**

troponins test, blood tests that measure levels of cardiac troponins (T and I), which are the standard biochemical markers for cardiac disease. This test assists in evaluating patients with suspected acute coronary ischemic syndrome. It is particularly useful in differentiating cardiac from noncardiac chest pain, evaluating patients with unstable angina, detecting reperfusion associated with coronary recanalization, estimating myocardial infarction size, and detecting perioperative myocardial infarction.

-tropous. See **-tropia.**

-tropy, -tropism, suffix meaning "influenced by or having an affinity for" something specified: *allotropy, ergotropy, syntropy.*

trospium, an anticholinergic.

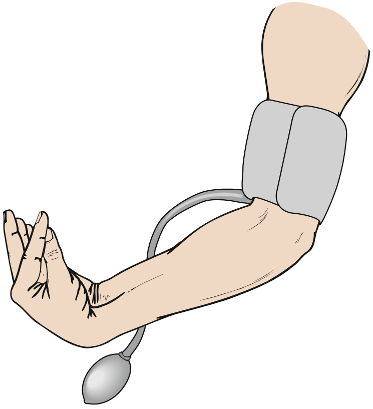
■ INDICATION: This drug is used to treat overactive bladder.

■ CONTRAINDICATIONS: Uncontrolled narrow-angle glaucoma, urinary retention, gastric retention, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include fatigue, dizziness, headache, dry eyes, vision abnormalities, flatulence, abdominal pain, and dyspepsia. Common side effects include constipation and dry mouth.

trough /trôf/ [AS, *trog*], a groove or channel, such as the gingival trough around the neck of a tooth.

Trousseau's sign /tro͝osōz′/ [Armand Trousseau, French physician, 1801–1867; L, *signum,* mark], **1.** a test for latent tetany in which carpal spasm is induced by inflating a sphygmomanometer cuff on the upper arm to a pressure exceeding systolic blood pressure for 3 minutes. A positive test may be seen in hypocalcemia and hypomagnesemia. **2.** a reddened streak, the result of drawing a finger across the skin. It is seen with a variety of nervous system disorders.



Trousseau's sign *(Lewis et al, 2011)*

Trousseau's syndrome [Armand Trousseau], superficial migratory thrombophlebitis associated with visceral cancer.

trovafloxacin /tro′vah-flok′sah-sin/, an antibacterial effective against a broad spectrum of gram-positive and gram-negative organisms. It is administered orally as the mesylate salt in the treatment of serious infections.

Trp, abbreviation for **tryptophan.**

true ankylosis. See **ankylosis.**

true birth rate [ME, *treue,* faith, *burthe* + L, *reri,* to calculate], the ratio of total births to the total female population of childbearing age, between 15 and 45 years of age. Compare **birth rate, crude birth rate, refined birth rate.**

true chondroma. See **enchondroma.**

true conjugate, a radiographic measurement of the distance from the upper margin of the symphysis pubis to the sacral promontory. It is usually 1.5 to 2 cm less than the diagonal conjugate. See also **conjugate.**

true denticle. See **denticle.**

true diverticulum [ME, *treue,* faith; L, *diverticulare,* to turn aside], diverticulum that includes all the same tissue layers as the organ from which it originates.

true dwarf. See **primordial dwarf.**

true glottis. See **glottis.**

true hermaphroditism [ME, *treue,* faith; Gk, *Hermaphroditos,* son of Hermes and Aphrodite], a condition in which an individual is born with both male and female gonads.

true labor, uterine contractions that result in a change in the cervix and the birth of an infant.

true neuroma, any neoplasm composed of nerve tissue.

true oxygen, the calculated concentration as either a percentage or a fraction that, when multiplied by the expiratory minute volume at STPD, gives oxygen uptake.

true pelvis. See **pelvis.**

true rib. See **rib, vertebrosternal rib.**

true shunt. See **zero V/Q.**

true suture, an immovable fibrous joint of the skull in which the edges of bones interlock along a series of processes and indentations. The three kinds of true sutures are the sutura dentata, the sutura limbosa, and the sutura serrata. Compare **false suture.**

true twins. See **monozygotic twins.**

true value, (in statistics) a value that is closely approximated by the definitive value and somewhat less closely by the reference value.

true vocal cords [ME, *treue,* faith; L, *vocalis,* of the voice; Gk, *chorde,* string], the vocal folds of the larynx (plicae vocales), as distinguished from the vestibular folds (plicae vestibulares), called false vocal cords. They are located inferior to the false vocal cords. See also **vocal cord.**

truncal /trung′kəl/ [L, *truncus*], pertaining to the trunk of the body or to any arterial or nerve trunk.

truncal ataxia, a loss of coordinated muscle movements for maintaining normal posture of the trunk.

truncal obesity, obesity that preferentially affects or is located in the trunk of the body as opposed to the extremities.

truncated /trung′kātid/, **1.** amputated from the trunk. **2.** cut across at right angles to the long axis.

truncus /trung′kəs/ [L, trunk], the main stem of an anatomical part from which branches may arise, such as the sympathetic nerve chain or jugular lymph trunk.

truncus arteriosus [L, trunk; Gk, *arteria,* airpipe], the embryonic arterial trunk that initially opens from both ventricles of the heart and later divides into the aorta and the pulmonary trunk, the two parts separated by the bulbar septum.

truncus brachiocephalicus, a branch of the aorta that divides into the right common carotid and right subclavian arteries.

trunk [L, *truncus*], **1.** the main stalk of an anatomical structure with many branches, such as an artery or nerve. **2.** also called **torso,** the body excluding the head and appendages.

trunk balance, the ability to maintain postural control of the trunk, including the shifting and bearing of weight on each side to free an extremity for a particular function such as reaching and grasping. Weight shifting can be anterior, posterior, lateral, or diagonal and involve righting, equilibrium, and protective reactions. Head and neck control allows for dissociation of the shoulder and pelvic girdles from the trunk.

trunk incurvation reflex. See **Galant reflex.**

Trusopt, a trademark for a carbonic anhydrase inhibitor (dorzolamide hydrochloride).

truss [Fr, *trousser,* to pack up], an apparatus worn to prevent or retard the herniation of the intestines or other organ through an opening in the abdominal wall.

trust [ME, protection], a risk-taking process whereby an individual's situation depends on the future behavior of another person.

truth [AS, *treowo*], a rule or statement that conforms to fact or reality.

truth serum, a common name for any of several sedatives, such as the short-acting barbiturates, that have been administered intravenously in subjects to elicit information that may have been repressed. It has been used successfully in helping to identify amnesia victims.

truth telling, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of whole truth, partial truth, or decision delay to promote the patient's self-determination and well-being. See also **Nursing Interventions Classification.**

trypanocide /tri-pan′o-sīd/, a drug destructive to trypanosomes, especially the species of protozoan parasite transmitted to humans by various insect vectors common in Africa and Central and South America. Various arsenic preparations are used to treat African sleeping sickness, caused by *Trypanosoma gambiense* and *T. rhodesiense,* and Chagas' disease, caused by *T. cruzi,* in the Americas. Also called **trypanosomicide. —trypanosomicidal,** *adj.*

Trypanosoma /trip′ənōsō′mə/ [Gk, *trypanon,* borer, *soma,* body], a genus of parasitic organisms, several species of which can cause significant diseases in humans. Most *Trypanosoma* organisms live part of their life cycle in insects and are transmitted to humans by insect bites. See also **trypanosome, trypanosomiasis.**

Trypanosoma brucei gambiense. See **Gambian trypanosomiasis.**

Trypanosoma brucei rhodesiense. See **Rhodesian trypanosomiasis.**

Trypanosoma cruzi. See **Chagas' disease.**

trypanosomal infection. See **trypanosomiasis.**

trypanosome /trip′ənōsōm′, tripan′-/, any organism of the genus *Trypanosoma*. See also **trypanosomiasis.** **—trypanosomal,** *adj*.

trypanosomiasis /trip′ənō′sōmī′əsis/ [Gk, *trypanon* + *soma* + *osis,* condition], an infection by an organism of the *Trypanosoma* genus. Kinds of trypanosomiasis are **African trypanosomiasis** and **Chagas' disease.** Also called **trypanosomal infection.**

trypanosomicide /trip′ənōsō′misīd/ [Gk, *trypanon* + *soma* + L, *caedere,* to kill]. See **trypanocide.**

trypsin /trip′sin/ [Gk, *tripsis,* rubbing], a proteolytic digestive enzyme produced by the exocrine pancreas that catalyzes in the small intestine the breakdown of dietary proteins to peptones, peptides, and amino acids.

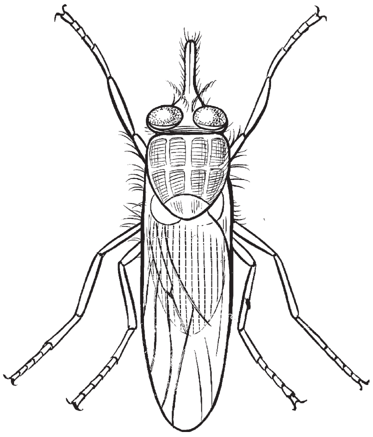
trypsin, crystallized, a proteolytic enzyme from the pancreas of the ox, *Bos taurus,* that has been used as a debriding agent for open wounds and ulcers.

trypsin inhibitor, one of a group of peptides, present in such varied sources as soybeans, egg white, and human colostrum, that mask or inhibit the active site of the trypsin molecule. Also called **kunitz inhibitor.**

trypsinogen /tripsin′əjən/ [Gk, *tripsis* + *genein,* to produce], the inactive precursor form of trypsin. Trypsinogen is secreted in pancreatic juice and converted to active trypsin through the action of enterokinase in the intestine. Also called **protrypsin.**

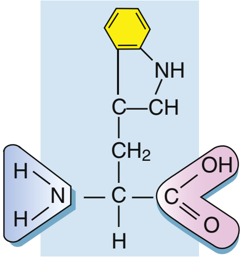
tryptase. See **proteinase.**

tsetse fly /tset′sē, tsē′tsē/ [Afr, *tsetse* + AS, *flyge*], a blood-sucking fly found in regions of Africa, mainly south of the Sahara desert. It is an insect of the *Glossina* genus and a secondary host of trypanosomes, which cause African sleeping sickness and other diseases in humans and domestic and wild animals. Also spelled **tzetze fly.** See also **trypanosomiasis.**



Tsetse fly *(Auerbach, 2007)*

tryptophan (Trp) /trip′təfan/, an amino acid essential for normal growth and nitrogen balance. Tryptophan is the precursor of several important biomolecules, including serotonin and niacin. See also **amino acid, protein.**



Chemical structure of tryptophan

TSEM, abbreviation for **transmission scanning electron microscopy.**

TSH, abbreviation for **thyroid-stimulating hormone.**

T-shaped fracture, an intercondylar fracture that has both longitudinal and transverse portions in the form of a T.

TSH assay, thyroid-stimulating hormone test.

TSH releasing factor. See **thyrotropin-releasing hormone.**

TSH test, abbreviation for **thyroid-stimulating hormone test.**

tsp, abbreviation for **teaspoon.**

T-spine, thoracic spine.

TSS, abbreviation for **toxic shock syndrome.**

TSTA, abbreviation for *tumor-specific transplantation antigen*.

tsutsugamushi disease. See **scrub typhus.**

TT, **1.** abbreviation for **thrombolytic therapy.** **2.** abbreviation for **therapeutic touch.**

t test, a statistic test used to determine whether there are differences between two means or between a target value and a calculated mean.

TTP, abbreviation for **thrombotic thrombocytopenic purpura.**

T tube, **1.** a tubular device in the shape of a T, inserted through the skin into a cavity or a wound and used for drainage. **2.** an apparatus used to connect a source of humidified oxygen to the endotracheal tube so that a spirometer can be attached for the evaluation of tidal volume.

T tube cholangiography, a type of biliary tract radiographic examination in which a water-soluble iodinated contrast medium is injected into the bile duct through an indwelling, T-shaped rubber tube. The tube is inserted in the common bile duct as a routine postoperative procedure to provide drainage.

T tubule system, a system of tubular invaginations along the surface of all striated muscle cell membranes, providing an extension of the membrane into the cells. The system is believed to be part of an extensive endomembrane system involved in storing calcium ions and in the movement of action potentials into the cells. T tubules are likely to be the link between membrane stimulation and the triggering of the release of calcium ions from the sarcoplasmic reticulum.

T.U., **1.** abbreviation for *toxin unit*. **2.** abbreviation for *tuberculin unit*.

tubal abortion /t(y)o͞o′bəl/ [L, *tubus* + *ab,* away from, *oriri,* to be born], a condition of pregnancy in which an embryo, ectopically implanted, is expelled from the uterine tube into the peritoneal cavity. Tubal abortion is often accompanied by significant internal bleeding, causing acute abdominal and pelvic pain, or it may be asymptomatic, the products of conception being resorbed. Rarely the conceptus reimplants on the peritoneum and continues growing to become an abdominal pregnancy. See also **abdominal pregnancy, ectopic pregnancy, tubal pregnancy.**

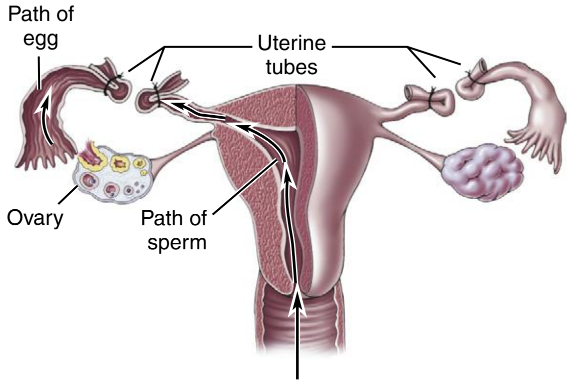
tubal air cells, air cells on the floor of the eustachian tube close to the carotid canal.

tubal dermoid cyst, a tumor derived from embryonal tissues that develops in an oviduct.

tubal embryo transfer (TET), **1.** a method of ART consisting of retrieval of oocytes from the ovary, followed by their fertilization and culture in the laboratory with placement of the resulting embryos in the fallopian tubes by laparoscopy more than 24 hours after the original retrieval. **2.** laparoscopic transfer of cryopreserved embryos to the fallopian tubes.

tubal factor infertility, female factor infertility caused by an abnormality of the uterine tubes, such as scarring or obstruction following a urinary tract infection, pelvic inflammation, or sexually transmitted infection.

tubal ligation, one of several sterilization procedures in which both fallopian tubes are blocked to prevent conception from occurring. Through a small abdominal incision, the fallopian tubes are ligated in two places with laser; and the intervening segment is burnt, crushed, or excised. The procedure is less commonly performed vaginally. Complications of the procedure, which are rare but serious, include pulmonary embolism, hemorrhage, infection, and tubal pregnancy. The requirements for informed consent for sterilization procedures vary among states and institutions.



Tubal ligation *(Herlihy, 2011)*

tubal pregnancy, an ectopic pregnancy in which the conceptus implants in the fallopian tube. Approximately 2% of all pregnancies are ectopic; of these, approximately 90% are tubal. Tubal pregnancy seldom occurs in primigravidas. The most important predisposing factor is prior tubal injury. Pelvic infection, scarring and adhesions from surgery, or intrauterine device complications may result in damage that diminishes the motility of the tube. Transport of the ovum through the tube after fertilization is slowed, and implantation takes place before the conceptus reaches the uterine cavity. Most often the tube, which cannot long contain the growing fetus, ruptures, precipitating an intraperitoneal hemorrhage. If not stopped, the hemorrhaging can lead rapidly to shock and often death. Some conceptuses apparently die and are resorbed in the tube. Diagnosis of tubal pregnancy is often difficult. With rupture of the fallopian tube, women commonly experience sudden sharp pain in one side of the lower abdomen, but signs and symptoms of tubal pregnancy are insidiously variable, and the classic triad of amenorrhea, pelvic pain, and a tender adnexal mass are present only 50% of the time. Recovery of blood from the cul-de-sac by means of culdocentesis is highly suggestive of a ruptured fallopian tube and tubal pregnancy; it requires immediate surgical exploration of the abdomen. Absence of blood on culdocentesis does not rule out the presence of an unruptured tubal pregnancy. Laparotomy may be required, particularly if a woman's pregnancy test is positive, the pelvic findings are suggestive, and sonography of the pelvis cannot demonstrate an intrauterine pregnancy. Because of the lethal potential of an undiagnosed tubal pregnancy, women who report any of the characteristic symptoms early in their pregnancies, particularly during the time before the existence of a normal intrauterine pregnancy can be confirmed, must be considered susceptible. In women who have a history of prior pelvic disease and in those who have symptoms or signs of tubal pregnancy, emergency treatment requires an immediate IV infusion via a large-bore IV catheter, type and crossmatch of blood for blood replacement, and treatment of shock as necessary. In very early ectopic pregnancy, treatment by methotrexate is 90% effective. Otherwise, treatment is surgical and involves laparotomy, removal of the entire products of conception and any intraperitoneal blood present, and the removal or repair of the involved tube. Conditions that predispose to a first tubal pregnancy also predispose to a second; a woman who has had one tubal pregnancy has one chance in five of having another in a subsequent pregnancy. Depending on the location of the developing embryo, the condition is classified as an ampullary, fimbrial, or interstitial tubal pregnancy.

tubal prominence. See **torus tubarius.**

tube /t(y)o͞ob/ [L, *tubus*], a hollow, cylindric piece of equipment or structure of the body.

tube care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with an external drainage device exiting the body. See also **Nursing Interventions Classification.**

tube care: chest, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with an external water-seal drainage device exiting the chest cavity. See also **Nursing Interventions Classification.**

tube care: gastrointestinal, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with a gastrointestinal tube. See also **Nursing Interventions Classification.**

tube care: umbilical line, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a newborn with an umbilical catheter. See also **Nursing Interventions Classification.**

tube care: urinary, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with urinary drainage equipment. See also **Nursing Interventions Classification.**

tube care: ventriculostomy/lumbar drain, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of a patient with an external cerebrospinal fluid drainage system. See also **Nursing Interventions Classification.**

tube feeding, the administration of nutritionally balanced liquefied foods or nutrients through a tube inserted into the esophagus, stomach, duodenum, or jejunum. The conditions for which tube feeding is administered include after mouth or gastric surgery, in severe burns, in paralysis or obstruction of the esophagus, in severe cases of anorexia nervosa, and for unconscious patients or those unable to chew or swallow.

Also called **esophageal feeding, gavage feeding, jejunostomy feeding, nasogastric feeding.** See also **drip gavage, enteral tube feeding.**

tube feeding care, the nursing care and management of a patient receiving nourishment through a nasogastric tube.

■ METHOD: The tip of a nasogastric tube is lubricated with a water-soluble lubricant, inserted into a nostril, and rapidly advanced into the stomach as the patient, if conscious, is asked to swallow hard repeatedly. Correct placement of the tube may be best determined by x-rays. Placement also may be checked, although not as reliably, by listening for a bubbling sound through a stethoscope placed over the stomach as 5 mL of air is injected into the tube. The pH of secretions may also be checked. If the patient coughs forcefully when 1 or 2 mL of water is injected into the tube, it is placed in the upper respiratory tract rather than the stomach. The tube, held securely and comfortably by a tape across the nose or upper lip, may be left in place in adults and older children but usually is removed and reinserted for each feeding in infants. Before each feeding the patient is helped up to a semi-Fowler's position or is turned on the right side and elevated slightly if unconscious. If a cuffed tracheostomy tube or endotracheal tube is in place, the cuff is inflated. The nasogastric tube is checked for proper placement and for the amount of residual formula in the stomach. Any solid medication to be given with the feeding is dissolved in water. The normal liquefied diet formula contains a mixture of milk, eggs, sugar, skim milk powder, and protein hydrolysates. A low-residue formula consists of amino acids, sugars, vitamins, and minerals. Blue food coloring can be added to the formula to help detect aspirations by distinguishing gastric contents from respiratory secretions. Depending on the patient's preference, the formula is at or below room temperature when administered slowly by gravity at a rate of no more than 300 mL an hour. During feeding the patient is observed for respiratory distress, nausea, vomiting, abdominal cramps, and restlessness. At the completion of the procedure, the tube is flushed with water as ordered and then clamped. The patient receives oral hygiene and lubrication and cleaning of the nares and is maintained in the same position for 30 minutes after feeding. At that time, the cuff on the tracheostomy or endotracheal tube is deflated.

■ INTERVENTIONS: The nurse positions the patient for feeding, checks the tube placement, notes and replaces the amount of residual formula, and reports residual volume in excess of 100 mL, or 75% of the previous feeding. Bags and tubing need to be changed per institutional protocol to prevent bacterial growth. The nurse administers the feeding, ensures that the patient and family members understand the purpose of the procedure, and cautions the patient to report symptoms such as nausea, abdominal cramps, diarrhea, or constipation.

■ OUTCOME CRITERIA: A formula containing the proper proportions of protein, carbohydrate, and fat administered through a nasogastric tube can provide adequate nutrition over a short term. A high content of simple sugars may cause diarrhea. Concentrated mixtures containing too little water or large volumes administered rapidly may dehydrate the patient. See also **nasogastric intubation.**

tube gain, the overall electron gain of a photomultiplier tube, calculated as gn, where g is the dynode gain and n is the number of dynodes in the tube. Thus, if g is 3 and n is 8, the tube gain is 3^8, or 6561. See also **dynode.**

tuber /t(y)o͞o′bər/, a knoblike localized swelling.

tubercle /t(y)o͞o′bərkəl/ [L, *tuber,* swelling], **1.** a nodule or a small eminence, such as that on a bone. **2.** a nodule, especially an elevation of the skin that is larger than a papule, such as Morgagni's tubercles of the areolae of the breasts. **3.** a small rounded nodule produced by infection with *Mycobacterium tuberculosis,* consisting of a gray translucent mass of small spheric cells surrounded by connective cells.

tubercle of sella turcica, the anterior wall of the sella turcica. Also called **tuberculum sellae.**

tubercular /t(y)o͞obur′kyələr/ [L, *tuber,* swelling], pertaining to or resembling tuberculosis.

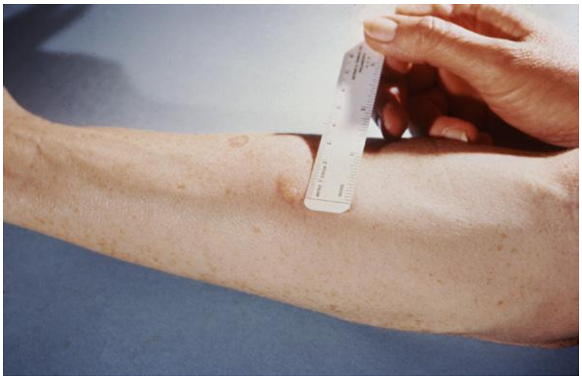
tuberculid /t(y)o͞obur′kyəlid/, recurrent skin or mucous membrane lesions in which the tubercle bacillus is absent. It is the result of sensitivity to mycobacterial antigens in patients with tuberculosis.

tuberculin. See **tuberculin test, tuberculosis.**

tuberculin purified protein derivative /to͞obur′kyo͞olin/, a solution containing a purified protein fraction derived from isolated culture filtrates of strains of *Mycobacterium tuberculosis.* It is used as an aid in the diagnosis of tuberculosis, in the Mantoux test, and, for the same purpose in a dried form, in multiple puncture devices. See also **Mantoux test, tine test.**

tuberculin reaction, hardening or blistering as a delayed reaction at the site of a tuberculin test, a positive result that indicates previous exposure to either the vaccine or the disease.

tuberculin test [L, *tuber* + *testum,* crucible], a test to determine past or present tuberculosis infection based on a positive skin reaction, using one of several methods. A purified protein derivative of tubercle bacilli, called **tuberculin,** is introduced into the skin by scratch, puncture, or intradermal injection. If a raised, red, or hard zone forms surrounding the tuberculin test site, the person is said to be sensitive to tuberculin, and the test is read as positive. However, a negative tuberculin reaction does not rule out a diagnosis of previous or active tuberculosis. Sputum and gastric cultures, acid-fast staining, and x-ray studies often are needed to establish a diagnosis of tuberculosis. Kinds of tuberculin tests include **Heaf test, Mantoux test, Pirquet's test,** and **tine test.**

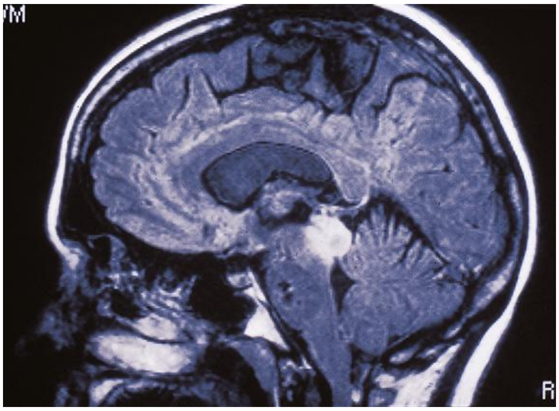


Positive tuberculin test

(Courtesy of The Centers for Disease Control Public Health Image Library [ID #3752], Atlanta, Georgia)

tuberculoid leprosy. See **leprosy.**

tuberculoma /t(y)o͞obur′kyəlō′mə, to͞obur′kyo͞olō′mə/ [L, *tuber* + Gk, *oma,* tumor], a rare tumorlike growth of tuberculous tissue in the central nervous system, characterized by symptoms of an expanding cerebral, cerebellar, or spinal mass. Treatment consists of the administration of antimicrobial drugs to resolve the primary growth and to prevent meningitis.



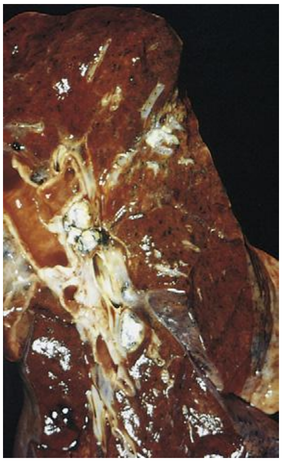
Tuberculoma
(Stone and Gorbach, 2000)

tuberculosis (TB) /t(y)o͞obur′kyəlō′sis/ [L, *tuber* + Gk, *osis,* condition], a chronic granulomatous infection caused by an acid-fast bacillus, *Mycobacterium tuberculosis*. It is generally transmitted by the inhalation or ingestion of infected droplets and usually affects the lungs, although infection of multiple organ systems occurs. Persons who are immunodeficient, such as those infected with human immunodeficiency virus, may have extrapulmonary tuberculosis. This includes disseminated tuberculosis, which involves multiple organs such as the liver, lung, spleen, bone marrow, and lymph nodes. Diagnosis is through biopsy, stain, sputum and gastric cultures, and x-ray studies. Central nervous system tuberculosis may occur as inflammation of the meninges or a mass lesion (tuberculoma).

■ OBSERVATIONS: Listlessness, vague chest pain, pleurisy, anorexia, fever, and weight loss are early symptoms of pulmonary tuberculosis. Night sweats, pulmonary hemorrhage, expectoration of purulent sputum, and dyspnea develop as the disease progresses. The lung tissues react to the bacillus by producing protective cells that engulf the disease organism, forming tubercles. Untreated, the tubercles enlarge and merge to form larger tubercles that undergo caseation, eventually sloughing off into the cavities of the lungs. Hemoptysis occurs as a result of cavitary spread.

■ INTERVENTIONS: The bacillus is generally sensitive to isoniazid, pyrazinamide, paraaminosalicylic acid, streptomycin, rifampin, ethambutol, dihydrostreptomycin, ultraviolet radiation, and heat. A combination of drugs is prescribed, with regular tests of the function of the kidneys, liver, eyes, and ears to discover early signs of drug toxicity. This is particularly important because drug therapy will usually continue for up to 1 year. The person may be hospitalized for the first weeks of treatment to limit the possible spread of infection, to encourage rest and excellent nutrition, to ensure complete compliance with the prescribed drug regimen, and to observe for adverse drug effects. Samples of sputum are regularly examined. The disease is not infectious after the bacillus is no longer present in the sputum. Care of an outpatient includes continued medication, evaluation for adverse drug effects, sputum analyses, and encouragement to complete the long course of treatment. All contacts are tested periodically with purified protein derivative. People who are at increased risk of infection may be treated empirically, without a positive diagnosis having been made. BCG vaccination has been widely used worldwide but may not be effective at preventing tuberculosis.

■ NURSING CONSIDERATIONS: Before discharge the patient is taught how to prevent the spread of the disease; the elements of good nutrition; the name, dose, action, and side effects of all medications prescribed; the need to take the drugs regularly; and how and where to get the next supply of drugs. Plans for follow-up care are discussed; they include date, time, and place of the next laboratory tests; referral to community nurses is made. The patient is reminded that a cough, weight loss, fever, night sweats, and hemoptysis are danger signals that are to be reported immediately. See also **miliary tuberculosis, tuberculin test.**



Primary pulmonary tuberculosis *(Kumar et al, 2007)*

tuberculosis culture, a microbiology culture to diagnose tuberculosis. The spread of disease is a possible result of conventional culture techniques, which take 4 to 6 weeks. Newer, more rapid techniques include the BACTEC method, which uses a substrate labeled with radioactive carbon; polymerase chain reaction culture methods, which use genetic DNA probes to detect *Mycobacterium tuberculosis;* and a sputum smear for acid-fast bacillus.

tuberculosis vaccine. See **bacille Calmette Guérin vaccine.**

tuberculous /t(y)o͞obur′kyələs/ [L, *tuber*], pertaining to tuberculosis.

tuberculous arthritis, a joint inflammation caused by invasion of the joint by tuberculosis bacilli that have migrated from a primary infection, usually in the chest.

tuberculous epididymitis, inflammation and swelling of the epididymis caused by infection with *Mycobacterium tuberculosis*, such as from spread of renal tuberculosis.

tuberculous lymphadenitis [L, *tuber* + *lympha,* water; Gk, *aden,* gland, *itis,* inflammation], an inflammation of the lymph glands caused by the presence of *Mycobacterium tuberculosis*.

tuberculous meningitis. See **meningitis.**

tuberculous peritonitis [L, *tuber* + Gk, *peri* + *teinein,* to stretch, *itis,* inflammation], an inflammation of the peritoneum that is secondary to a tuberculous infection in the viscera.

tuberculous pneumonia [L, *tuber* + Gk, *pneumon,* lung], a complication of tuberculosis in which caseous material is inhaled into the bronchi, leading to bronchopneumonia or lobar pneumonia.

tuberculous prostatitis, a type of granulomatous prostatitis caused by infection with *Mycobacterium tuberculosis*.

tuberculous spondylitis, a rare, grave form of tuberculosis caused by the invasion of *Mycobacterium tuberculosis* into the spinal vertebrae. The intervertebral disks may be destroyed, resulting in the collapse and wedging of affected vertebrae and the shortening and angulation of the spine. Thoracic vertebrae are more frequently involved than the vertebrae of the lumbar, cervical, or sacral segments of the spine. More than one area of the spine may be affected, and normal vertebrae may be evident between affected sections. The infection characteristically dissects vertebrae anterolaterally and produces abscesses. The pressure of the abscess may cause ischemic paralysis in the subjacent spinal cord, and abscesses in the cervical area may displace or obstruct the trachea and the esophagus. Treatment requires an extended regimen of at least three anti-tuberculosis drugs. Also called **Pott's disease, spinal caries.** See also **tuberculosis.**

tuberculum /t(y)o͞obur′kyələm/, a tubercle, nodule, or rounded elevation.

tuberculum sellae. See **tubercle of sella turcica.**

tuberosity /t(y)o͞o′bəros′itē/ [L, *tuber*], an elevation or protuberance, especially of a bone.

tuberosity of the tibia, a large oblong elevation at the proximal end of the tibia to which the ligament of the patella attaches.

tuberous carcinoma /t(y)o͞o′bərəs/ [L, *tuber* + Gk, *karkinos,* crab, *oma,* tumor], a scirrhous carcinoma of the skin characterized by nodular projections. Also called **carcinoma tuberosum.**

tuberous sclerosis, a familial, neurocutaneous disease characterized by epilepsy, mental deterioration, adenoma sebaceum, nodules and sclerotic patches on the cerebral cortex, retinal tumors, depigmented leaf-shaped macules on the skin, tumors of the heart or kidneys, and cerebral calcifications. There is no effective treatment. Also called **Bourneville's disease, epiloia.** See also **adenoma sebaceum.**

tuberous xanthoma. See **xanthoma tuberosum.**

tube-slide agglutination test, a type of sperm agglutination test in which sperm and serum are mixed in a tube and then transferred to a slide for examination.

tubo- /t(y)o͞o′bō-, t(y)o͞o′bə-/, prefix meaning "tube or tubing": *tubular.*

tuboabdominal gestation /-abdom′inəl/ [L, *tubus* + *abdomen,* belly; L, *gestare,* to bear], an ectopic pregnancy in which the embryo develops while partly in the abdominal cavity and partly in the fallopian tube. The condition usually begins as a tubal pregnancy and extends into the abdomen as development continues. Also called *tuboabdominal pregnancy.*

tubocurarine chloride. See **curare.**

tubo-ovarian /t(y)o͞o′bō·ōver′ē·ən/ [L, *tubus* + *ovum,* egg], pertaining to the ovary and fallopian tube. Also *tubo-ovarial.*

tubo-ovarian abscess [L, *tubus* + *ovum* + *abscedere,* to go away], an abscess involving the ovary and fallopian tube. It is commonly associated with salpingitis.

tubo-ovarian cyst [L, *tubus* + *ovum* + Gk, *kystis,* bag], a cyst that forms by adhesion of the ovary at the fimbriated end of the fallopian tube.

tubo-ovarian gestation [L, *tubus* + *ovum* + *gestare,* to bear], an ectopic pregnancy that develops partly in the fallopian tube and partly in the ovary. Also called *tubo-ovarian pregnancy.*

tuboplasty /t(y)o͞o′bōplas′tē/ [L, *tubus,* tube; Gk, *plassein,* to mold], a surgical procedure in which severed or damaged fallopian tubes are repaired in hopes of restoring fertility.

tubular. See **tubule.**

tubular capillary plexus, a vascular network formed by the capillaries around the renal tubules.

tubular maximum. See **transport maximum.**

tubular necrosis [L, *tubulus,* little tube; Gk, *nekros,* dead, *osis,* condition], the death of cells in the small tubules of the kidneys as a result of disease or injury.

tubule /t(y)o͞o′byo͞ol/ [L, *tubulus*], a small tube, such as one of the collecting tubules in the kidneys, the seminiferous tubules of the testes, or Henle's tubules between the distal and proximal convoluted tubules. **—tubular,** *adj.*

tubulin binding agents, a group of medications that bind tubulin and arrest cell mitosis. Abnormal blood vessels in tumors are particularly sensitive to these agents.

tubuloglomerular feedback, a feedback mechanism in the juxtaglomerular apparatus of the kidney, so that changes in solute concentration at the macula densa link to control the glomerular filtration rate and help ensure a relatively constant delivery of solutes to the distal tubule.

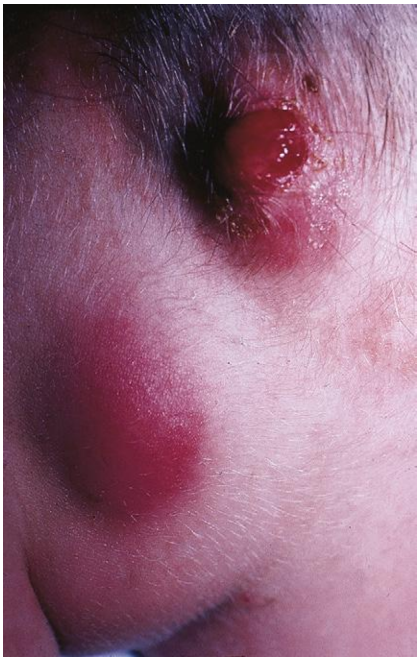
tuft [Fr, *touffe,* a tuft], an object resembling a tassle, such as a tuft of hair.

tuft fracture [Fr, *touffe,* tuft; L, *fractura,* break], a break in any one of the distal phalanges.

tug [ME, *toggen,* to pull], a dragging or hauling movement or sensation.

tularemia /to͞o′lərē′mē·ə/ [Tulare, California; Gk, *haima,* blood], an infectious disease of animals caused by the bacillus *Francisella (Pasteurella) tularensis,* which may be transmitted by insect vectors or direct contact. It is characterized in humans by fever, headache, and an ulcerated skin lesion with localized lymph node enlargement or by eye infection, GI ulcerations, or pneumonia, depending on the site of entry and the response of the host. This disease can be fatal if not treated with the appropriate antibiotics. Treatment includes streptomycin, chloramphenicol, and tetracycline. Recovery produces lifelong immunity. A vaccine was used in the past to protect laboratory workers but is not currently available; however, a new vaccine is in development. Also called **deerfly fever, rabbit fever.** Also spelled *tularaemia.*

TULIP, abbreviation for **transurethral laser-induced prostatectomy.**



Tularemia *(Stone and Gorbach, 2000)*

tumescence /t(y)o͞omes′əns/ [L, *tumescere,* to begin to swell], a state of swelling or edema.

-tumescence, suffix meaning a "swelling": *detumescence, intumescence, tumescence.*

tumescent anesthesia, administration of a dilute local infiltration anesthetic (lidocaine) through the use of large volumes of fluid. The technique is applied in liposuction surgery, varicose vein treatment, scalp surgery, dermabrasion, and soft tissue reconstruction.

tummy tuck. See **abdominoplasty.**

tumor (T) /t(y)o͞o′mər/ [L], **1.** a swelling or enlargement occurring in inflammatory conditions. **2.** also called **neoplasm,** a new growth of tissue characterized by progressive, uncontrolled proliferation of cells. The tumor may be localized or invasive, benign or malignant. A tumor may be named for its location, for its cellular makeup, or for the person who first identified it.

tumor albus, a white swelling occurring in a tuberculous bone or joint.

tumor angiogenesis factor (TAF), a protein that stimulates the formation of blood vessels in tumors. See also **angiogenin.**

tumoricidal. See **tumoricide.**

tumoricidal agent, an agent that is destructive to cancer cells. See also **antineoplastic.**

tumoricide /t(y)o͞omôr′isīd/, a substance capable of destroying a tumor. **—tumoricidal,** *adj.*

tumorigenesis /t(y)o͞o′mərijen′əsis/, the process of initiating and promoting the development of a tumor. Compare **carcinogenesis, oncogenesis, sarcomagenesis. —tumorigenic,** *adj.*

tumorigenic /-jen′ik/ [L, *tumor,* swelling; Gk, *genein,* to produce], capable of producing tumors.

tumor-induced osteomalacia, oncogenic osteomalacia.

tumor lysis syndrome, an oncological emergency characterized by a decreased calcium level with elevated phosphate, potassium, and uric acid levels occuring after effective induction chemotherapy of rapidly growing malignant neoplasms; thought to be due to release of intracellular products after cell lysis.

tumor marker, a substance in the body that may be associated with the presence of a cancer.

tumor necrosis factor (TNF), a natural body protein, also produced synthetically, with anticancer effects. The body produces it in response to the presence of toxic substances, such as bacterial toxins. Adverse effects are toxic shock and cachexia.

tumor necrosis factor receptor–associated periodic syndrome (TRAPS). See **familial periodic fever.**

tumor registry, a repository of data on the incidence of cancers and personal characteristics, treatment, and treatment outcomes of patients diagnosed with cancer.

tumor-specific antigen, an antigen produced by a particular type of tumor that does not appear on normal cells of the tissue in which the tumor developed.

tumor suppressor gene, a gene whose function is to limit cell proliferation and loss of whose function leads to cell transformation and tumor growth. Also called **antioncogene.**

tumor viruses [L, *tumor,* swelling, *virus,* poison], viruses that are capable of directly or indirectly inducing tumor formation. Direct tumor formation may result from inoculation of living cells with tumorigenic viruses. Tumor formation may result from the influence of the virus on normal cells that are transformed into tumor cells.

tumor volume, a part of an organ or tissue that includes both the tumor and adjacent areas of invasion.

Tunga penetrans. See **chigoe.**

tungiasis /tung·gī′ə·sis/, infestation of the skin with the chigoe *(Tunga penetrans).* See also **chigoe.**

tungsten (W) /tung′stən/ [SW, *tung,* heavy, *sten,* stone; *wolfram,* the German word for tungsten], a metallic element. Its atomic number is 74; its atomic mass is 183.85. It has the highest melting point of all metals and is used as a target material in x-ray tubes and as filaments in incandescent light bulbs.

tunica /t(y)o͞o′nikə/ [L, tunic], an enveloping coat or covering membrane.

tunica adventitia, the outer layer or coat of an artery or other tubular structure. See also **arterial wall.**

tunica albuginea [L, *tunica* + *albus,* white], a tissue covering of white collagenous fibers, such as the sclerotic coat of the eyeball and the testes.

tunica dartos. See **dartos fascia.**

tunica intima, the membrane lining an artery. See also **arterial wall.**

tunica media, a muscular middle coat of an artery. See also **arterial wall.**

tunica vaginalis testis, the serous membrane surrounding the testis and epididymis, derived from the peritoneum.

tunica vasculosa bulbi. See **uvea.**

tuning fork /t(y)o͞o′ning/ [Gk, *tonos,* stretching; L, *furca,* fork], a small metal instrument consisting of a stem and two prongs that produces a constant pitch when either prong is struck. It is used by physicians as a screening test of air and bone conduction.

tunnel [OFr, *tonnel,* fowl trap], a canal or passage, such as the carpal tunnel.

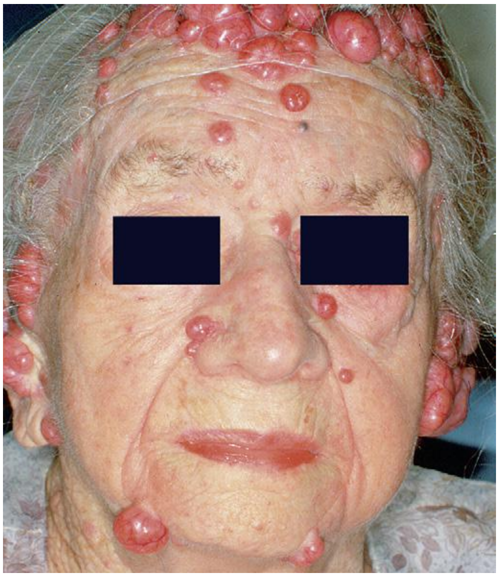
tunneled catheter, a central venous catheter left in place for a long period so that scar tissue forms and anchors it in place.

tunnel vision [OFr, *tonnel,* fowl trap; L, *videre,* to see], a defect in sight in which there is a great reduction in the peripheral field of vision, as if looking through a hollow tube or tunnel. The condition occurs in advanced glaucoma.

tunnel wound [OFr, *tonnel* + AS, *wund*], a break in the surface of the body or an organ in which the entry and exit wounds are the same size.

TUR, abbreviation for **transurethral resection.**

turban tumor /tur′bən/ [Turk, *tulbend,* headdress; L, *tumor,* swelling], a benign neoplasm consisting of pink or maroon nodules that may cover the entire scalp, trunk, and extremities. The growth is familial and often recurs after excision.



Turban tumor

(Krachmer, Mannis, and Holland, 2011)

turbid /tur′bid/ [L, *turbidus,* confused], clouded or obscured, as in solids in suspension in a solution.

turbidimetry /tur′bidim′ətrē/ [L, *turbidus,* confused; Gk, *metron,* measure], measurement of the turbidity (cloudiness) of a solution or suspension in which the amount of transmitted light is quantified with a spectrophotometer or estimated by visual comparison with solutions of known turbidity.

turbidity /tərbid′itē/ [L, *turbidus*], a condition of light scattering in a liquid resulting from the presence of suspended particles. Turbidity increases with the concentration of particles and depends on their shapes and sizes.

turbinate /tur′binit/ [L, *turbinum,* top-shaped], **1.** pertaining to a scroll shape. **2.** pertaining to the concha nasalis.

turgid /tur′jid/ [L, *turgidus*], swollen, hard, and congested, usually as a result of an accumulation of fluid. **—turgor,** *n*. Compare **flaccid**.

turgor /tur′gər/ [L, *turgere,* to be swollen], the expected resiliency of the skin caused by the outward pressure of the cells and interstitial fluid. Dehydration results in decreased skin turgor, manifested by lax skin that, when grasped and raised between two fingers, slowly returns to a position level with the adjacent tissue. Marked edema or ascites results in increased turgor manifested by smooth, taut, shiny skin that cannot be grasped and raised. Elderly people normally do not have “good” skin turgor because of a lack of skin elasticity, an expected part of aging. An evaluation of the skin turgor is an essential part of physical assessment.

turista. See **traveler’s diarrhea.**

turnbuckle cast [AS, *tyrnan* + ME, *bocle,* small shield; ONorse, *kasta*], an orthopedic device used to encase and immobilize the entire trunk, one upper arm to the elbow, and the opposite upper leg to the knee. It is constructed of plaster of paris or fiberglass and incorporates hinges as part of its design in the treatment of scoliosis. The hinges are placed at the level of the apex of the curvature. It is used for preoperative and postoperative positioning, although less frequently than the Risser cast. An adaptation of the turnbuckle cast is used occasionally as a hyperextension cast for the treatment of kyphosis or kyphoscoliosis. Compare **Risser cast.**

Turner’s sign. See **Grey Turner’s sign.**

Turner’s syndrome [Henry H. Turner, American endocrinologist, 1892–1970], a chromosomal anomaly seen in about 1 in 3000 live female births, characterized by the absence of one X chromosome; congenital ovarian failure; genital hypoplasia; cardiovascular anomalies; dwarfism; short metacarpals; “shield chest”; exostosis of tibia; and underdeveloped breasts, uterus, and vagina. Spatial disorientation and moderate degrees of learning disorders are common. Treatment includes genetic counseling, hormone therapy (estrogens, androgens, pituitary growth hormone), and often surgical correction of cardiovascular anomalies and the webbing of the neck skin. Also called **Bonnevie-Ullrich syndrome, monosomy X.** See also **Noonan’s syndrome.**

turnkey /turn′kē/, a term referring to a computer system or installation that is complete on delivery and ready to operate without modification.

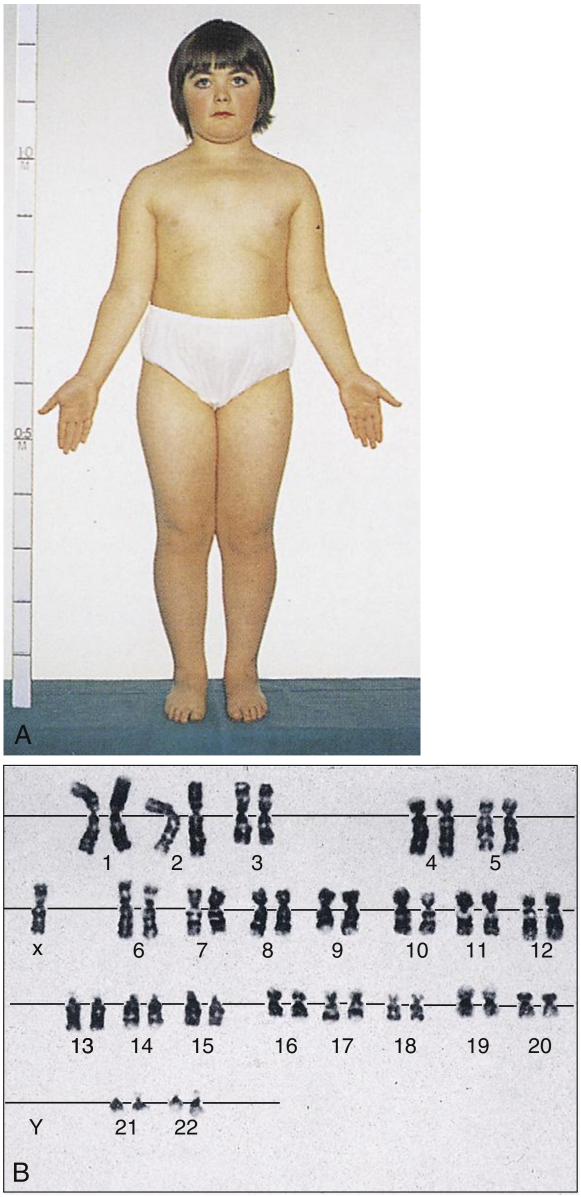
TURP, abbreviation for **transurethral resection of the prostate.**

turricephaly. See **oxycephaly.**

TUR syndrome, severe hyponatremia caused by the absorption of fluids used to irrigate the bladder during transurethral resection of the prostate.

-tuse, **1.** suffix meaning “dull or blunt”: *obtuse*. **2.** suffix meaning “to beat or bruise”: *contuse*.

Tussionex, a trademark for a fixed-combination drug containing an antitussive (hydrocodone) and an antihistamine **(phenyltoloxamine citrate).**



Turner’s syndrome. *A,* This young woman exhibits many of the characteristics of Turner syndrome, including short stature, webbed neck, and sexual immaturity. *B,* As this karyotype shows, Turner syndrome results from monosomy of sex chromosomes (genotype XO) *(Patton and Thibodeau, 2010/Courtesy Nancy X. Wexler, Ph.D., Columbia University)*

tussis /tus′is/ [L, *tussis,* cough], a cough or pertussis.

tussive, pertaining to or due to a cough.

tussive fremitus /tus′iv/ [L, *tussis,* cough, *fremitus,* murmuring], a vibratory cough that can be felt by a hand over the chest of the patient.

tussive headache, pain or discomfort in the head caused by traction on the meninges and cerebral vessels associated with coughing.

tussive syncope, a fainting episode caused by an increase in intrathoracic pressure associated with paroxysms of coughing. Recovery of consciousness and lucidity is rapid.

tutamen, a protective covering or structure, such as the eyelids and eyelashes.

tutorial /t(y)o͞otôr′ē·əl/ [L, *tueri,* to look with care], a form of instruction in which the student is guided step-by-step through the application of knowledge to a clinical situation or computer application.

TV, abbreviation for **tidal volume.**

TVL, abbreviation for **tenth-value layer.**

T wave, the component of the cardiac cycle shown on an electrocardiogram as a short, inverted, U-shaped curve after the S-T segment. It represents membrane repolarization phase 3 of the cardiac action potential.

Tweed triangle [Charles Tweed, American dentist, 1895–1970; L, *triangulus,* three-cornered], the triangle formed by the mandibular plane, the Frankfurt horizontal plane, and the long axis of the lower central incisor. It is used as a diagnostic aid.

Tween 80 /twēn/, a trademark for a preparation of polysorbate 80, a surfactant.

twelfth cranial nerve. See **hypoglossal nerve.**

twentieth-century syndrome. See **total allergy syndrome.**

24-hour clock system, a method of designating time by using the numeric sequence from 00 to 23 for the hours and the numbers 00 to 59 for the minutes in a daily cycle beginning with 0000 (midnight) and ending with 2359 (1 minute before the next midnight). The system provides a clear distinction between prenoon and afternoon time without requiring the designations AM and PM. Also called **military time.**

twiddler's syndrome, the nervous habit of slight manipulation of entry portals causing the displacement of inserted wires or catheters.

twilight state [Ger, *Zwielicht,* twilight; L, *status*], an impaired state of consciousness in which the patient may experience visual or auditory hallucinations and responds to them with irrational behavior. The person may be unaware of the surroundings at the time of the experience and have no memory of it later, except perhaps to recall a related dream. It may be induced with certain anesthetics. Also called **deep sedation.**

twin [AS, *twinn,* double], either of two offspring born of the same pregnancy and developed from either a single ovum or from two ova that were released from the ovary simultaneously and fertilized at the same time. The incidence of twin births is approximately 1 in 80 pregnancies. Kinds of twins include **conjoined twins, dizygotic twins, interlocked twins, monozygotic twins, Siamese twins,** and **unequal twins.** See also **Hellin's law.**

twinge /twinj/ [ME, *twengen,* to pinch], a sudden, brief, darting pain.

twinning [AS, *twinn*], **1.** the development of two or more fetuses during the same pregnancy, either spontaneously or through external intervention for experimental purposes in animals. **2.** the duplication of like structures or parts by division.

twin-to-twin transfusion, an intrauterine abnormality of fetal circulation in monozygotic twins, in which blood is shunted directly from one twin to the other.

twin-twin transfusion syndrome, a syndrome caused by twin-to-twin transfusion in which the donor twin develops hypovolemia, hypotension, anemia, microcardia, and growth retardation while the recipient twin develops hypervolemia, hypertension, polycythemia, cardiomegaly, and congestive heart failure. Hydramnios frequently occurs.

twin-wire orthodontic appliance, a fixed orthodontic appliance that typically uses a pair of 0.01-inch (0.25-mm) wires to form the midsection of the arch wire. It is used to correct the crowding of anterior teeth and to expand the dental arch.

twitch [AS, *twiccian*], **1.** the contraction of small muscle units, manifested as a quick, simple, spasmodic contraction of a muscle. **2.** to jerk convulsively.

twitching [AS, *twiccian*], a series of contractions by small muscle units. Twitching that involves large groups of muscle fibers is identified as **fascicular twitching.**

two-point discrimination test, a test of the ability of a person to differentiate touch stimuli at two nearby points on the body at the same time. It is used in studies of possible damage to the parietal regions of the brain.

Two-point discrimination test *(Seidel et al, 2011)*

two-point gait [OE, *twa* + L, *punctus,* pricked; ONorse, *gata,* way], a pattern of crutch-walking in which the right foot and left crutch advance together, followed by the left foot and right crutch. See also **three-point gait.**

two-way catheter [AS, *twa* + *weg* + Gk, *katheter,* something lowered], a catheter that has a double lumen, one channel for injection of medication or fluids and the other for removal of fluid or specimens.

TXA_2, abbreviation for **thromboxane A_2.**

TXB_2, abbreviation for **thromboxane B_2.**

Tygacil, a trademark for **tigecycline.**

tying forceps, a thumb forceps with fine, smooth tips for tying sutures in ophthalmological surgery.

Tykerb, a trademark for **lapatinib.**

Tylenol, a trademark for an analgesic and antipyretic (acetaminophen).

tylosis /tīlō′sis/, formation of a callus.

tyloxapol /tīlok′səpôl/, an ocular lubricant used to lubricate, clean, and wet artificial eyes to improve wearing comfort; it also has a detergent action that is used to help break up mucus.

tympan-, prefix meaning "the tympanic membrane": *tympanoplasty, tympanotomy.*

tympana. See **tympanic.**

tympanal. See **tympanic.**

tympanectomy /tim′pənek′təmē/ [Gk, *tympanon,* drum, *ektomē,* excision], the surgical removal of the tympanic membrane.

tympanic /timpan′ik/ [Gk, *tympanon,* drum], pertaining to a structure that resonates when struck; drumlike, such as a *tympanic abdomen* that resonates on percussion because the intestines are distended with gas. Also called **tympanal.** —**tympanum** /tim′pənəm, *pl,* **tympana,** *n.*

tympanic antrum, a relatively large, irregular cavity in the superior anterior part of the mastoid process of the temporal bone, communicating with the mastoid air cells and lined by the extension of the mucous membrane of the tympanic cavity. The bony tegmen tympani separates the tympanic antrum from the middle fossa of the cranial cavity, and the lateral semicircular canal of the internal ear projects into the antrum. See also **mastoid process.**

tympanic cavity. See **middle ear.**

tympanic cells, tympanic air cells, spaces in the tympanic cavity between the bony projections of the floor or jugular wall that sometimes communicate with the tubal air cells.

tympanic membrane, a thin, semitransparent membrane in the middle ear that transmits sound vibrations to the internal ear by means of the auditory ossicles. It is nearly oval in form, with a vertical diameter of about 10 mm, and separates the tympanic cavity from the bottom of the external acoustic meatus. Also called **eardrum, membrana tympani.**

tympanic membrane thermometer, a device that measures the temperature of the tympanic membrane by detecting infrared radiation from the tissue. Results are obtained within 2 seconds and directly reflect the body's core temperature. *Tympanic thermometer* is the common term. See also **ear thermometry.**

Tympanic membrane thermometer *(Potter et al, 2011)*

tympanic nerve, a branch of the glossopharyngeal nerve that participates in the formation of the tympanic plexus and provides sensory innervation within the middle ear to the mucosa of the cavity, pharyngotympanic tube, and mastoid air cells. It also contributes general visceral efferent fibers, which leave the tympanic plexus in the lesser petrosal nerve.

tympanic reflex, the reflection of a beam of light shining on the eardrum. In a normal ear, a bright, wedge-shaped reflection is seen. Its apex is at the end of the malleus, and its base is at the anterior inferior margin of the eardrum. In disorders of the middle ear or eardrum, this shape may be distorted.

tympanic resonance [Gk, *tympanon* + L, *resonare,* to sound again], a drumlike or hollow sound heard over a large air space of the body such as the pneumothorax.

tympanic sulcus [Gk, *tympanon,* drum; L, *sulcus,* furrow], a narrow circular groove at the medial end of the osseous part of the external acoustic meatus that holds the tympanic membrane.

tympanic temperature, the body temperature as measured electronically at the tympanic membrane. See also **tympanic membrane thermometer.**

tympano-, prefix meaning "ear drum or tympanic membrane": *tympanoplasty, tympanotomy.*

tympanogram /timpan′əgram/, a graphic representation of the acoustic impedance and air pressure of the middle ear and the mobility of the tympanic membrane, measured as part of the audiological test battery. In the normal middle ear, the air pressure is the same as the atmospheric pressure, as shown by a peak in the middle of the tympanogram. Various middle ear pathologies such as otitis media, otosclerosis, or tympanic membrane perforations each yield distinctive tympanograms. See also **acoustic impedance.**

tympanomastoidectomy, mastoidectomy with tympanectomy, done as either closed cavity or open cavity.

tympanoplasty /timpan′əplas′tē/ [Gk, *tympanon* + *plassein,* to mold], any of several operative procedures on the eardrum or ossicles of the middle ear designed to restore or improve hearing in patients with conductive hearing loss. These operations may be used to repair a perforated eardrum, for otosclerosis, or for dislocation or necrosis of one of the small bones of the middle ear. See also **myringoplasty, stapedectomy.**

tympanosclerosis, a condition characterized by the presence of masses of hard, dense connective tissue around the auditory ossicles in the middle ear.

tympanostomy. See **myringotomy.**

tympanotomy. See **myringotomy.**

tympanum, typanic cavity.

tympany /tim′pənē/ [Gk, *tympanon,* drum], a loud, high-pitched musical sound percussed over the upper gastric area or a pneumothorax.

-type, suffix meaning a "representative form or class": *lysotype, serotype, somatotype.*

type, the general or prevailing character of any particular case, such as of a disease, person or substance.

type I AV block. See **Mobitz I heart block.**

type 1 diabetes mellitus, an autoimmune disease characterized by inability to metabolize fuels, carbohydrates, protein, and fat because of absolute insulin deficiency. Type 1 diabetes can occur at any age, but its incidence is more common in children, where it is the most common chronic disease of childhood. Uncontrolled type 1 diabetes is characterized by excessive thirst, increased urination, increased desire to eat, loss of weight, keta acidosis, diminished strength, and marked irritability. The clinical onset is usually rapid, but approximately one third of patients have a remission within 3 months (honeymoon phase). This stage may continue for days or months, but type 1 diabetes then progresses quickly to a state of total dependence on insulin. Persons with type I diabetes can manage their condition with a carbohydrate-controlled meal plan, exercise, and insulin. Evidence suggests that type 1 diabetes may be triggered by environmental factors, such as a viral infection in genetically susceptible individuals. Formerly called **brittle diabetes, insulin-dependent diabetes mellitus, juvenile diabetes, juvenile onset diabetes, juvenile onset-type diabetes, ketosis-prone diabetes.** Compare **type 2 diabetes mellitus.** See also **diabetes mellitus.**

type 1 antineuronal antibody (ANNA-1). See **anti-Hu antibody.**

type I error, **1.** in a test of a statistical hypothesis, the probability of rejecting the null hypothesis when it is true and should be accepted. It occurs when researchers observe a difference when in fact there is none. Also called **alpha error, error of the first kind. 2.** a false negative.

type I hyperlipidemia. See **hyperlipidemia type I.**

type I hypersensitivity. See **anaphylactic hypersensitivity.**

type 2 antineuronal antibody (ANNA-2). See **anti-Ri antibody.**

type II AV block. See **Mobitz II heart block.**

type 2 diabetes mellitus, a type of diabetes mellitus characterized by insulin resistance in appropriate hepatic glucose production and impaired insulin secretion. Onset is usually after 40 years of age but can occur at any age, including during childhood and adolescence. Familial aggregation implies that genetic factors and environmental factors, such as obesity and a sedentary lifestyle, superimposed on genetic suseptibility are involved in the onset. The majority of persons with type 2 diabetes are obese; glucose tolerance is often improved by modest weight loss and increased activity. Persons with type 2 diabetes can manage their disorder with a meal plan, increased activity, oral antidiabetes agents such as insulin secretagogues, biguanides, alpha glucosidase inhibitors and insulin sensitizers, and insulin. Maturity onset diabetes of young is a rare type 2 diabetes, and an autosomal-dominant inheritance is clearly established. Previously called **adult-onset diabetes, ketosis-resistant diabetes, maturity-onset diabetes, non-insulin-dependent diabetes mellitus, stabile diabetes.** Also called **type II diabetes mellitus.** See also **diabetes mellitus.**

type II error, in a test of a statistical hypothesis, the probability of accepting the null hypothesis when it is false and should be rejected. Also called **beta error, error of the second kind.**

type II hypersensitivity. See **cytotoxic anaphylaxis.**

type IV hypersensitivity. See **cell-mediated immune response.**

type A personality [Gk, *typos,* mark], a parent ego state characterized by a behavior pattern described by Meyer Friedman and Ray Rosenman as associated with individuals who are highly competitive and work compulsively to meet deadlines. The behavior also is associated with a higher than usual incidence of coronary heart disease.

type B personality, a child ego state characterized by a form of behavior associated by Friedman and Rosenman with people who appear free of hostility and aggression and who lack a compulsion to meet deadlines, are not highly competitive at work and play, and have a lower risk of heart attack.

type E personality, a term introduced by Harriet Braiker to describe professional women who fit neither type A nor type B personality categories but who have a marked sense of insecurity and strive to convince themselves that they are worthwhile. Type E women try to be “all things to all people,” according to Braiker, and tend to suffer psychological strain. Also called **adult ego state.**

type specificity. See **specificity.**

typhlitis. See **cecitis.**

typhlo-, **1.** prefix meaning “cecum”: *typhlocolitis, typhlostenosis, typhlostomy.* **2.** prefix meaning “blindness”: *typhlolexia, typhlology, typhlosis.*

typho-, prefix meaning “fever” and related to typhus and typhoid fevers.

typhoid /tī′foid/ [Gk, *typhos,* fever, *eidos,* form], pertaining to or resembling typhus.

-typhoid, suffix meaning “typhus”: *antityphoid, bronchotyphoid, meningotyphoid, nephrotyphoid, paratyphoid, posttyphoid.*

typhoid carrier, a person without signs or symptoms of typhoid fever who carries the bacteria that cause the disease and sheds the pathogens in body excretions. The typical typhoid carrier has recovered from an attack of the disease.

typhoid fever [Gk, *typhos,* fever, *eidos,* form; L, *febris,* fever], a bacterial infection usually caused by *Salmonella typhi,* transmitted by contaminated milk, water, or food. It is characterized by headache, delirium, cough, watery diarrhea, rash, and a high fever. The incubation period may be as long as 60 days. Characteristic maculopapular rosy spots are scattered over the skin of the abdomen and chest. Splenomegaly and leukopenia develop first. Complications include intestinal hemorrhage or perforation and thrombophlebitis. The disease is serious and may be fatal. Some people who recover continue to be carriers and excrete the organism, spreading the disease. Also called **cesspool fever, enteric fever.** Compare **cholera, paratyphoid fever, salmonellosis.**

typhoid nodules [Gk, *typhos,* fever; L, *nodulus,* small knot], a liver nodule consisting of a cluster of monocytes and lymphocytes surrounding the typhoid fever pathogen, *Salmonella typhi.*

typhoid pellagra, a form of pellagra in which the symptoms also include continued high temperatures.

typhoid vaccine, a bacterial vaccine prepared from an inactivated dried strain of *Salmonella typhi.*

■ INDICATION: It is prescribed for primary immunization against typhoid fever for adults and children. According to the National Institute of Health, routine typhoid vaccination is not recommended in the United States. It is only recommended for those who are traveling to areas outside of the U.S. to areas where typhoid is common.

■ CONTRAINDICATIONS: Acute infection or concomitant use of corticosteroids prohibits its use.

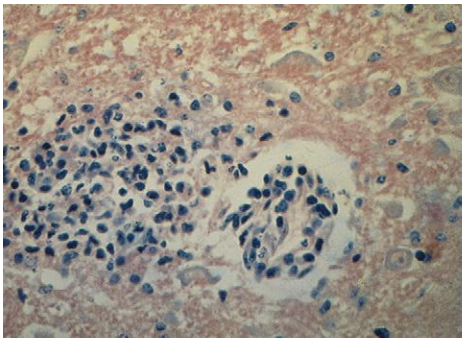
■ ADVERSE EFFECTS: Among the more serious adverse effects are anaphylaxis and pain and inflammation at the site of injection.

typhoid vaccine live oral, a preparation of the attenuated strain *Salmonella typhi* Ty21a. It is administered orally.

typhomania /tīfōmā′nē·ə/, a condition characterized by coma and delirium, associated with typhus, typhoid fever, and similar febrile infections.

typhous /tī′fəs/ [Gk, *typhos,* fever], pertaining to typhus fever.

typhus /tī′fəs/ [Gk, *typhos,* fever], any of a group of acute infectious diseases caused by various species of *Rickettsia* and usually transmitted from infected rodents to humans by the bites of lice, fleas, mites, or ticks. These diseases are all characterized by headache, chills, fever, malaise, and a maculopapular rash. Kinds of typhus are **epidemic typhus, murine typhus,** and **scrub typhus.** See also **Brill-Zinsser disease, Rocky Mountain spotted fever.**



Typhus nodule in the brain

(Kumar et al, 2010)

typhus vaccine, any one of three vaccines, each of which is prepared for the different rickettsial organisms that cause epidemic typhus, murine typhus, or Brill-Zinsser disease.

■ INDICATIONS: Each is prescribed for immunization against a form of typhus.

■ CONTRAINDICATIONS: Acute infection, debilitating disease, concomitant use of corticosteroids, or hypersensitivity to eggs prohibits its use.

■ ADVERSE EFFECTS: Among the most serious adverse effects are anaphylaxis and various allergic reactions. Pain at the site of injection also may occur.

-typia, suffix meaning “(condition of) conformity to type”: *atypia, ectypia, zelotypia.*

typical /tip′ikəl/ [L, *typicus,* characteristic of a kind], a representative example.

typing [Gk, *typos,* mark], the process of classifying a specimen of blood, tissue, or other substance according to common traits or characteristics. See also **blood typing, tissue typing.**

typo-, prefix meaning “a particular type”: *typology, typography.*

Tyr, abbreviation for **tyrosine.**

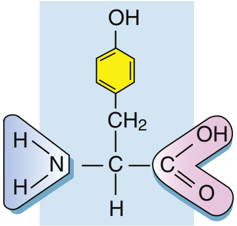
tyramine /tī′rəmēn/ [Gk, *tyros,* cheese, *amine,* ammonia], an amino acid synthesized in the body from the essential amino acid tyrosine. Tyramine stimulates the release of the catecholamines epinephrine and norepinephrine. People taking monoamine oxidase inhibitors should avoid the ingestion of foods and beverages containing tyramine, particularly aged cheeses and meats, bananas, yeast-containing products, and certain alcoholic beverages, such as red wines. See also **amine, catecholamine, epINEPHrine, norepinephrine, sympathomimetic, vasoconstriction.**

tyro-, prefix meaning “cheese”: *tyrogenous, tyroid, tyrometosis.*

tyroma /tīrō′mə/ *pl.* **tyromas, tyromata** [Gk, *tyros* + *oma,* tumor], a new growth or nodule with a caseous or cheesy consistency.

tyromatosis /tī′rōmətō′sis/ [Gk, *tyros* + *oma* + *osis,* condition], a process in which necrotic tissue is broken down and degenerates to a granular, amorphous, caseous mass.

tyrosine (Tyr) /tī′rəsēn/ [Gk, *tyros*], an amino acid synthesized in the body from the essential amino acid phenylalanine. Tyrosine is found in most proteins and is a precursor of melanin and several hormones, including epinephrine and thyroxine. See also **amino acid, hormone, melanocyte.**



Chemical structure of tyrosine

tyrosinemia /tī′rōsinē′mē·ə/ [Gk, *tyros* + *haima,* blood], **1.** a benign, transient condition of the newborn, especially premature infants, in which an excessive amount of the amino acid tyrosine is found in the blood and urine. The disorder is caused by an anomaly in amino acid metabolism, usually delayed development of the enzymes necessary to metabolize tyrosine, and is controlled by dietary measures and vitamin C therapy. The metabolic defect disappears with treatment, or it may disappear spontaneously. Also called **neonatal tyrosinemia. 2.** a hereditary disorder involving an inborn error of metabolism of the amino acid tyrosine. The condition, which is transmitted as an autosomal-recessive trait, is caused by an enzyme deficiency and results in liver failure or hepatic cirrhosis, renal tubular defects that can lead to renal rickets and renal glycosuria, generalized aminoaciduria, and mental retardation. Treatment consists of a diet low in tyrosine and phenylalanine and high in vitamin C. In severe cases prognosis is extremely poor, and a liver transplantation may be the only lifesaving measure. Also called **hereditary tyrosinemia.**

tyrosinosis /tī′rōsinō′sis/ [Gk, *tyros* + *osis,* condition], a rare condition resulting from a defect in amino acid metabolism and transmitted as an autosomal-recessive trait. It is characterized by the excretion of an excessive amount of parahydroxyphenylpyruvic acid, an intermediate product of tyrosine, in the urine. There is no known treatment. See also **tyrosinemia.**

tyrosinurea /tī′rōsino͝or′ē·ə/ [Gk, *tyros* + *ouron,* urine], the presence of tyrosine in the urine.

Tysabri, a trademark for **natalizumab.**

Tyzeka, a trademark for **telbivudine.**

Tyzine, a trademark for an alpha-adrenergic drug **(tetrahydrozoline hydrochloride).**

Tzanck test /tsangk/ [Arnault Tzanck, Russian dermatologist in France, 1886–1954], a microscopic examination of cellular material from skin lesions to help diagnose certain vesicular diseases. The tissue is scraped from the base of a vesicle, placed on a slide, and stained with Wright’s or Giemsa’s stain. Multinucleated giant cells are diagnostic of herpesvirus or varicella. Typical pemphigus and other cells also can be identified.

tzetze fly. See **tsetse fly.**

U

U, **1.** abbreviation for **unit.** **2.** symbol for the element **uranium.**

UAO, abbreviation for **upper airway obstruction.**

ubiquinone /yo͞obik′winōn/, a naturally occurring organic compound found in the lipid core of mitochondrial membranes. It functions as a carrier in the electron transport chain that produces energy. Formerly called **coenzyme Q.** 2. an herbal supplement used in the treatment of cardiac as well as several other chronic and hereditary diseases.The safety and/or effectiveness of this supplement has not been established by the FDA.

ubiquitin /yo͞obik′witin/, a small polypeptide that is involved in histone modification and is a marker for intracellular protein transport and breakdown. It is found in all cells of higher organisms.

Uchida technique, a method of tubal ligation with injection of saline solution beneath the tubal mucosa to separate it from the underlying tube. A portion of mucosa is removed and the mucosa-free tube then retracts to form a stump that is closed with sutures.

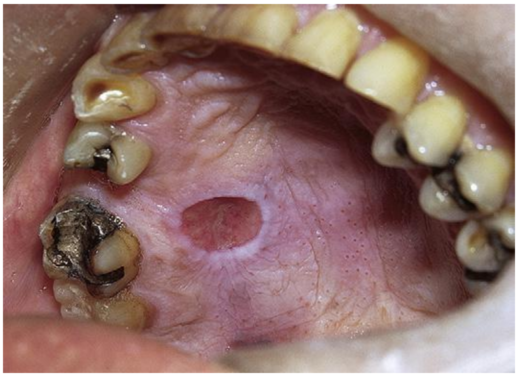
UGI, abbreviation for **upper GI.**

UICC, abbreviation for *Union for International Cancer Control, Unión internacional contra el cancer, Union internationale contre le cancer, Unio internationalis contra cancrum,* or *Unione internazionale contro il cancro*. http://www.uicc.org/

-ula, combining form meaning "small, little, minute": *macula*.

-ular, **1.** combining form meaning "pertaining to" something specified: *appendicular, molecular, pedicular.* **2.** combining form meaning "resembling" something specified: *circular, globular, tubular.*

ulcer /ul′sər/ [L, *ulcus,* a sore], a circumscribed, craterlike lesion of the skin or mucous membrane resulting from necrosis that accompanies some inflammatory, infectious, or malignant processes. An ulcer may be shallow, involving only the epidermis, as in pemphigus, or deep, as in a rodent ulcer. Some kinds of ulcers are **peptic ulcer, pressure ulcer,** and **serpent ulcer.** **—ulcerate,** *v.,* **ulcerative,** *adj*.



Chronic ulcer of the palate

(Regezi, Sciubba, and Jordan, 2008)

ulceration /ul′sərā′shən/ [L, *ulcus,* a sore], the process of ulcer formation. **—ulcerate,** *v.*

ulcerative blepharitis /ul′sərā′tiv, ul′sərətiv′/ [L, *ulcus* + *atus,* relating to; Gk, *blepharon,* eyelid, *itis,* inflammation], a form of blepharitis in which a staphylococcal infection of the follicles of the eyelashes and glands of the eyelids results in sticky crusts forming on the lid margins. If the crusts are pulled off, the skin beneath bleeds. Tiny pustules develop in the follicles of the eyelashes and break down to form shallow ulcers. Other symptoms include burning, itching, swelling, and redness of the eyelids; a loss of eyelashes; irritation of the conjunctiva with tearing; photophobia; and gluing together of the eyelids during sleep by the dried secretions. Compare **nonulcerative blepharitis.**

ulcerative colitis, a chronic, episodic, inflammatory disease of the large intestine and rectum. It is characterized by profuse watery diarrhea containing varying amounts of blood, mucus, and pus. Some of the many systemic complications of ulcerative colitis include peripheral arthritis, ankylosing spondylitis, kidney and liver disease, and inflammation of the eyes, skin, and mouth. People with severe disease may develop toxic megacolon, a dangerous complication that may lead to perforation of the bowel, septicemia, and death. Also called **inflammatory bowel disease.** See also **Crohn's disease.**

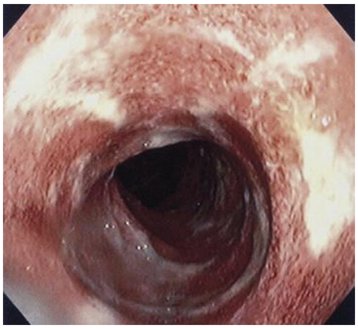
■ OBSERVATIONS: The attacks of diarrhea are accompanied by tenesmus, severe abdominal pain, fever, chills, anemia, and weight loss. Children with the disease may suffer retarded physical growth. The debilitating symptoms often prevent people with ulcerative colitis from carrying on the normal activities of daily living. Diagnosis of the disease is based on clinical signs, the results of barium x-ray films of the colon, and colonoscopy with biopsy. It is often difficult to differentiate between ulcerative colitis and Crohn's disease.

■ INTERVENTIONS: Medical treatment with corticosteroids or other antiinflammatory agents may help control the symptoms in some people. Those with severe disease or life-threatening complications may require surgery. Total proctocolectomy with ileostomy is a permanent cure. Ulcerative colitis carries an increased risk of cancer of the colon, and periodic colonoscopy is performed to rule out this complication. A person with ulcerative colitis is suffering from a chronic, life-threatening illness and requires frequent evidence of support and understanding during prolonged hospitalization.

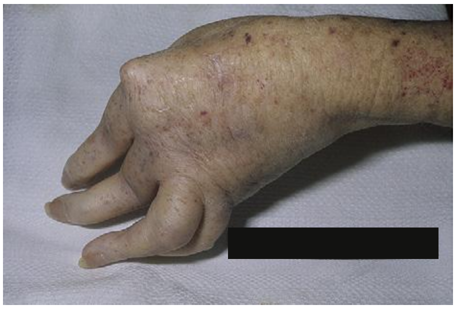
ulcerative inflammation [L, *ulcus* + *inflammare,* to set afire], the development of an ulcer over an area of inflammation.

ulcerative stomatitis [L, *ulcus* + Gk, *stoma,* mouth, *itis,* inflammation], an infectious disease of the mouth characterized by swollen spongy gums, ulcers, and loose teeth. Also called **trench mouth, ulceromembranous stomatitis, Vincent's angina.**

ulcerogenic drug /ul′sərōjen′ik/, a drug that produces or exacerbates peptic ulcers, such as aspirin and NSAID medications.

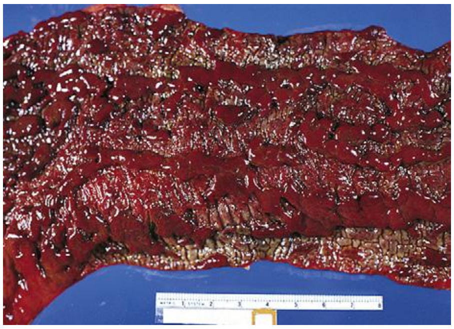


Ulcerative colitis: endoscopic view
(Goldman et al, 2008)

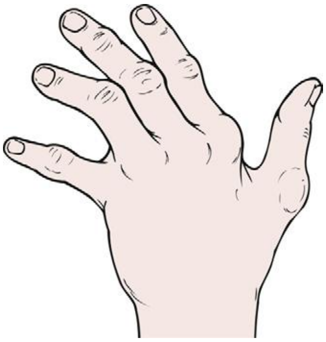


[redacted]

Ulnar drift
(Finkbeiner, Ursell, and Davis, 2009)



Ulcerative colitis *(Rosai, 2011)*



Ulnar drift *(Lewis et al, 2011)*

ulceromembranous /ul′sərōmem′brənəs/, describing an ulcer with a membranous exudation.

ulceromembranous stomatitis. See **ulcerative stomatitis.**

ulcerous /ul′sərəs/, pertaining to ulcers.

ULD, abbreviation for **upper level discriminator.**

ule-. See **ulo-.**

-ule. See **-ulum, -ulus.**

ulegyria /yo͞o′ləjī′rē·ə/, a cerebral cortex abnormality in which the gyri are narrow and distorted by scars.

-ulent, suffix meaning "full of, characterized by": *feculent, pulverulent, succulent*.

ulerythema /yo͞o′lərithē′mə/, a skin eruption characterized by redness and scarring.

ulna /ul′nə/ [L, elbow], the bone on the medial or little finger side of the forearm, lying parallel with the radius. Its proximal end bulges into the olecranon and the coronoid processes and dips into the trochlear and radial notches. The ulna articulates with the humerus and the radius. Also called **elbow bone.** See also **radius.**

ulnar /ul′nər/ [L, *ulna,* elbow], pertaining to the long medial bone of the forearm.

ulnar artery, a large artery branching from the brachial artery, supplying muscles in the forearm, wrist, and hand. Arising near the elbow, it passes obliquely in a distal direction to become the superficial palmar arch. It has nine branches: four in the forearm, two in the wrist, and three in the hand.

ulnar drift [L, *ulna,* elbow; AS, *drifan,* to drive], a change in the metacarpophalangeal joints because of rheumatoid arthritis and chronic synovitis. The long axes of the fingers make an angle with the long axis of the wrist so that the fingers are deviated to the ulnar side of the hand. Also called *ulnar deviation*.

ulnar nerve, one of the terminal branches of the brachial plexus that arises on each side from the medial cord of the plexus. It receives fibers from both cervical and thoracic nerve roots and supplies the muscles and skin on the ulnar side of the forearm and the hand. It can be easily palpated as the "funny bone" of the elbow as it courses along the groove between the olecranon process and the medial epicondyle of the humerus. Compare **median nerve, musculocutaneous nerve, radial nerve.**

ulnar reflex. See **pronator reflex.**

ulnocarpal /ul′nōkär′pəl/, pertaining to the ulna and carpus or ulnar area of the wrist.

ulnoradial /ul′nōrā′dē·əl/, pertaining to the ulna and radius and the ligaments associated with them.

ulo-, **1.** prefix meaning "scar or cicatrix": *ulodermatitis, uloid, ulotomy*. **2.** prefix meaning "gums or gingivae": *ulocase, ulorrhagia, ulotripsis*. Also **ule-.**

ulocarcinoma /yo͞o′lōkär′sinō′mə/ *pl.* **ulocarcinomas, ulocarcinomata** [Gk, *oule,* scar, *karkinos,* crab, *oma,* tumor], any malignant neoplasm of the gums that is classified as a carcinoma.

ulodermatitis /yo͞o′lōdur′mətī′tis/, dermatitis resulting in the destruction of tissue and scar formation.

uloid /yo͞o′loid/, resembling scar tissue.

ulterior transactions /ultir′ē·ər/, (in transactional analysis), communication that is bilevel. The first level is overt (social), usually of relevant verbal statements. The second level is usually covert (psychological) and nonverbal and has hidden psychological meaning. For example, "Come up to my apartment to see my etchings."

ultimate strain /ul′timit/, the strain at the point of failure.

ultimate stress, the highest load that can be sustained by a material at the point of failure.

ultra- /ul′trə-/, combining form meaning “beyond, farther, beyond a certain limit”: *ultragaseous, ultrasound, ultravirus*.

ultrabrachycephalic /-brak′ēsəfal′ik/, describing an extremely short, broad skull.

Ultracef, a trademark for a cephalosporin antibiotic **(cefadroxil monohydrate).**

ultracentrifuge /ul′trəsen′trifyo͞oj/ [L, *ultra*, beyond; Gk, *kentron*, center; L, *fugere*, to flee], a high-speed centrifuge with a rotation rate fast enough to produce sedimentation of protein and viruses, even in blood plasma. Use of an attached microscope may make it possible to see the sediment.

ultradian /-rā′dē·ən/ [L, *ultra* + *dies*, day], pertaining to a biorhythm that occurs in cycles of less than 24 hours.

ultrafilter /-fil′tər/, a semipermeable membrane with pores of a known diameter used to separate colloids and large molecules from water and other small molecules.

ultrafiltrate /-fil′trāt/ [L, *ultra* + Fr, *filtre*, filter], a solution that has passed through a semipermeable membrane with very small pores. It usually contains only low–molecular weight solutes.

ultrafiltration /-filtrā′shən/, a type of filtration, sometimes conducted under pressure, through filters with very small pores, such as those used by an artificial kidney. It can separate large molecules from smaller molecules in body fluids.

ultra-high-speed handpiece, a device for holding rotary instruments, such as burrs, that permits rotational speeds of 100,000 to 450,000 rpm. It is used primarily for the preparation of a tooth or teeth for a restoration.

Ultralente, a trademark for an insulin zinc suspension.

ultralente insulin. See **long-acting insulin.**

ultraligation /-līgā′shən/, tying or closing off a blood vessel beyond the point where it branches.

ultramicroscopy. See **darkfield microscopy.**

ultramicrotome /-mī′krətōm′/, a microtome that cuts very thin slices for examination by electron microscopy.

ultrasonic /ul′trəson′ik/ [L, *ultra*, beyond + *sonus*, sound], pertaining to ultrasound, or sound frequencies so high (greater than 20 kHz) that they cannot be perceived by the human ear.

ultrasonic cardiography. See **echocardiography.**

ultrasonic cleaner, a device that transmits high-energy, high-frequency sound waves into a fluid-filled container, used to remove deposits from instruments and appliances.

ultrasonic cleaning, the use of high-frequency vibrations to dislodge deposits from teeth or other objects.

ultrasonic lithotripsy, lithotripsy in which a rigid probe inserted to the site emits high-frequency sound waves to disintegrate the calculus.

ultrasonic nebulizer, a humidifier in which an electric current is used to produce high-frequency vibrations in a container of fluid. The vibrations break up the fluid into aerosol particles.

ultrasonics /-son′iks/, the science dealing with sound waves having frequencies above the approximately 20-kHz range of human hearing. Ultrasound evolved from the World War II sonar underwater detection apparatus and was first adapted for medical diagnostic purposes in the 1950s. It uses a transducer and generates very short pulses of high-frequency sound that are transmitted into the body. Echoes from interfaces within the body are displayed on a cathode ray tube so that images of normal and abnormal structures can be viewed.

ultrasonic scaler, a vibrating crystal-driven high frequency (18 to 50 kHz) instrument with a tip for supplying high-frequency vibrations which produces bubbles that form and collapse, allowing the removal of adherent deposits such as bacteria, biofilm, calculus, and other root surface accretions from the teeth. The water stream washes the gingival pocket and the root surfaces to dilute and remove endotoxins along with bits of inflamed tissue from the walls of the gingival crevice and loose debris. See also **hand scaling, sonic scaler.**

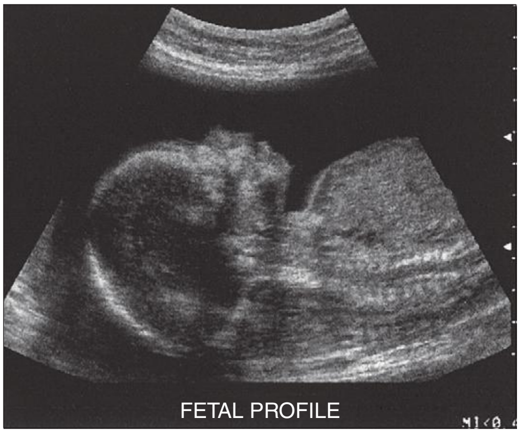
ultrasonic wave [L, *ultra*, beyond, *sonus*, sound], a sound wave transmitted at a frequency greater than 20,000 hz per second, or beyond the normal hearing range of humans. The specific wavelength is equal to the velocity divided by the frequency.

ultrasonographer. See **sonographer.**

ultrasonography /-sənog′rəfē/ [L, *ultra* + *sonus*, sound; Gk, *graphein*, to record], the process of imaging deep structures of the body by measuring and recording the reflection of pulsed or continuous high-frequency sound waves. It is valuable in many medical situations, including the diagnosis of fetal abnormalities, gallstones, heart defects, and tumors. Also called **sonography.**

ultrasonography: limited obstetric, a nursing intervention from the Nursing Interventions Classification (NIC) defined as performance of ultrasound exams to determine ovarian, uterine, or fetal status. See also **Nursing Interventions Classification.**

ultrasound /ul′trəsound/ [L, *ultra* + *sonus*], sound waves at the very high frequency of over 20 kHz (vibrations per second). Ultrasound has many medical applications, including fetal monitoring, imaging of internal organs, and, at an extremely high frequency, the cleaning of dental and surgical instruments. **—ultrasonic,** *adj*.



Ultrasound showing fetal profile

(Hagen-Ansert, 2006)

ultrasound diagnosing. See **ultrasound imaging.**

ultrasound dilution technique, a technique for measuring blood flow and access recirculation in hemodialysis patients. Ultrasound sensors are attached to the venous and arterial catheters in their normal positions and blood flow is checked. Then they are reversed; the ultrafiltration is turned off, and at a known flow rate, a bolus of saline is released into the venous catheter to dilute the blood. The velocity of the dilution as it passes through the access apparatus is measured by ultrasonography.

ultrasound imaging, the use of high-frequency sound (several MHz or more) to image internal structures by the differing reflection signals produced when a beam of sound waves is projected into the body and bounces back at interfaces between those structures. Ultrasound diagnosis differs from radiological diagnosis in that there is no ionizing radiation involved. Also called **ultrasound diagnosing.**

ultrastructure /-struk′chər/, a structure so small that it can be viewed only with an ultramicroscope or electron microscope.

ultraviolet (UV) /-vī′ələt/ [L, *ultra* + Fr, *violette*], light beyond the range of human vision, at the short end of the spectrum, or that part of the electromagnetic spectrum with wavelengths between about 10 and 400 nm. Equivalently, an ultraviolet photon has an energy between 5 and 500 eV. It occurs naturally in sunlight. It burns and tans the skin and converts precursors in the skin to vitamin D. Ultraviolet lamps are used in the control of infectious airborne bacteria and viruses and in the treatment of psoriasis and other skin conditions. Black light is ultraviolet light used in fluoroscopy. See also **angstrom, light, radiation, spectrum.**

ultraviolet (UV) lamp, a lamp that emits electromagnetic radiation in a range between 4 and 400 nm, or beyond the violet spectrum of visible light. Equipped with a nickel oxide filter, an ultraviolet lamp radiating at wavelengths around 360 nm can be used to examine hairs infected with certain agents. The pathogens reflect the ultraviolet light with a greenish-yellow fluorescence. See also **Wood's light.**

ultraviolet microscopy. See **fluorescent microscopy.**

ultraviolet (UV) radiation, a range of electromagnetic waves extending from the violet, or short-wavelength, end of the visible spectrum to the beginning of the x-ray spectrum. Near-UV radiation covers a range of wavelengths from 400 to 320 nm, middle-UV from 320 to 280 nm, and far-UV from 280 to about 10 nm. About 5% of the energy from the sun consists of UV radiation, but little reaches the earth because much is absorbed by oxygen and ozone in the atmosphere. Window glass also absorbs UV radiation. Artificial sources of UV radiation include the iron arc, the carbon arc, and the mercury vapor arc. For maximum transmission, prisms and lenses used for work in the UV region must be made of quartz, fluorite, or synthetic halides, which are transparent to UV radiation. In medicine, ultraviolet radiation is used in the treatment of rickets and certain skin conditions. Milk and some other foods become activated with vitamin D when exposed to this type of energy. UV radiation also causes certain substances to fluoresce or phosphoresce, a useful characteristic in such diverse applications as lighting and the identification of minerals.

ultraviolet (UV) rays [L, *ultra,* beyond; OFr, *violette* + L, *radius*], electromagnetic radiations found just beyond the violet edge of the visible spectrum, with wavelengths extending to the beginning of x-rays. The wavelengths range from 390 to 290 nm for near-UV rays to 290 to 20 nm for far-UV wavelengths. Ultraviolet radiation in the region of 260 nm can cause photochemical reactions in deoxyribonucleic molecules, causing mutations and destroying microorganisms, including bacteria and viruses.

ultraviolet (UV) therapy [L, *ultra,* beyond; OFr, *violette* + Gk, *therapeia,* treatment], the therapeutic application to the body of electromagnetic radiation in the ultraviolet region of the spectrum. This therapy is useful in the control of infectious airborne bacteria and viruses and in the treatment of psoriasis and other skin conditions.

-ulum, -ule, suffix meaning "small one": *ovulum, speculum, venule*.

-ulus, -ule, suffix meaning "small one": *homunculus, nodulus, ramulus*.

-um, suffix identifying singular nouns: *cerebellum, dextrum, quantum*.

umbilical /umbil′ikəl/ [L, *umbilicus,* navel], **1.** See **umbilicus. 2.** pertaining to the umbilical cord.

umbilical artery, the first branch of the anterior trunk of the internal iliac artery and the origin of the superior vesical artery. In the fetus, the umbilical artery is large and carries blood from the fetus to the placenta. After birth, the vessel closes distally to the origin of the superior vesical artery and eventually becomes a solid fibrous cord, the medial umbilical ligament.

umbilical artery catheter [L, *umbilicus,* navel; Gk, *arteria,* airpipe, *katheter,* a thing lowered], a catheter inserted into the umbilical artery of a newborn. See also **umbilical catheterization.**

umbilical catheterization, a procedure in which a radiopaque catheter is passed through an umbilical artery to provide a newborn with parenteral fluid, to obtain blood samples, or both, or through the umbilical vein for an exchange transfusion or the emergency administration of drugs, fluids, or volume expanders.

■ METHOD: Within 1 hour of insertion of the catheter, the position of the tip is validated by x-ray examination. The infant is maintained in a neutral thermal environment as parenteral fluids are delivered by an infusion pump. The rate of flow is checked hourly, and the IV bottle is never allowed to empty. All connections to the umbilical line are checked every 30 to 60 minutes, and only grounded electric equipment is used on or near the infant. At hourly intervals the young patient is repositioned, and the cardiac and respiratory rates are monitored; the axillary temperature is taken every 2 to 3 hours, and the pedal pulses are checked every 2 to 4 hours. The condition of the cord is observed every 2 to 3 hours for signs of infection such as redness, edema, or drainage at the catheter insertion site. The IV tubing is retaped when required, the cord dressing is changed, and antibiotic or antiseptic ointment is applied as ordered. If the umbilical line is displaced, pressure is quickly applied to the cord with a sterile 4 × 4-inch gauze, and an associate is delegated to notify the physician immediately. Fluid intake and output are measured. The infant is observed for oliguria or anuria; signs of vasospasm such as blanching, mottling, or darkening of the legs and absence of peripheral pulses; evidence of sepsis, hemorrhage, or oozing at the catheter insertion site; thromboembolism; and abdominal distension and vomiting, which may indicate necrotizing enterocolitis.

■ INTERVENTIONS: The nurse provides ongoing care, monitoring the catheterized infant for any signs of complications, which are promptly reported. The family is included in the care of the infant as much as possible.

■ OUTCOME CRITERIA: Umbilical catheterization can be an effective method of administering therapeutic fluids and agents or of obtaining diagnostic blood samples from a high-risk newborn, but great care is required in inserting and monitoring the tube.

umbilical cord, a flexible structure connecting the umbilicus with the placenta in the gravid uterus and giving passage to the two umbilical arteries and the umbilical vein. In the newborn it is about 2 feet long and ½ inch in diameter. First formed during the fifth week of pregnancy from the connecting stalk, it contains the yolk sac, stalk, and allantois. Also called the **chorda umbilicalis, funiculus umbilicalis.** See also **allantois.**

umbilical duct. See **vitelline duct.**

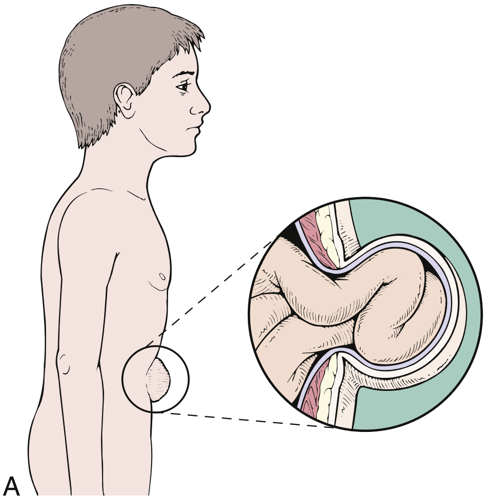
umbilical fascia, a thickening of the fascia transversalis extending along the median umbilical ligament downward from the umbilicus.

umbilical fissure, a groove on the inferior surface of the liver that holds the round ligament and separates the right and left lobes of the liver.

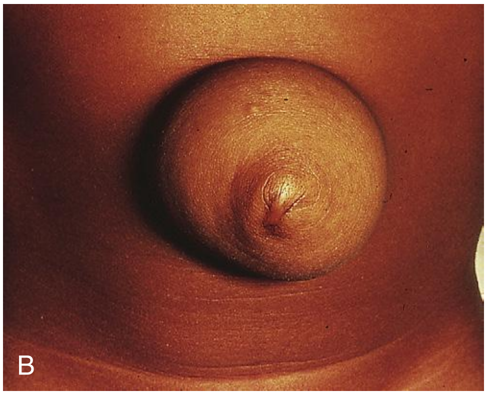
umbilical fistula, an abnormal passage from the umbilicus to the intestine or, more frequently, to the remnant of the canal in the median umbilical ligament that connects the fetal bladder with the allantois.

umbilical folds, folds of peritoneum in the urinary bladder covering the embryological remnants of the urachus and umbilical arteries. The median umbilical fold covers the urachus, and the medial umbilical folds cover the umbilical arteries.

umbilical hernia, a soft, skin-covered protrusion of intestine and omentum through a weakness in the abdominal wall around the umbilicus. It usually closes spontaneously within 1 to 2 years, although large hernias may require surgical closure.



***A,* Small intestinal involvement possibly seen with an umbilical hernia.** *(Frazier and Dryzmkowski, 2000)*



***B,* Photographic image of anumbilical hernia.** *(Salvo, 2009)*

umbilical region, the part of the abdomen surrounding the umbilicus, in the middle zone between the right and left lateral regions. See also **abdominal regions.**

umbilical vasculitis, an inflammation of the umbilical cord and its blood vessels.

umbilical vein, one of three embryonic vessels in the umbilical cord. It functions to return the blood from the placenta and fuses to form a single vein in the umbilical cord.

umbilical vesicle, a pear-shaped structure formed from the yolk sac at about the fourth week of prenatal development that protrudes into the cavity of the chorion and connects to the developing embryo by the yolk stalk at the region of the future midgut.

umbilication /um′bilikā′shən/ [L, *umbilicus,* navel], the process of becoming dimpled or pitted or acquiring a depressed area.

umbilicus /umbilī′kəs, umbil′ikəs/ [L, navel], the point on the abdomen at which the umbilical cord joined the fetal abdomen. In most adults it is marked by a depression; in some, it is marked by a small protrusion of skin. It interrupts the linea alba about halfway between the infrasternal notch and the pubic symphysis. It is located at the level of the interspace of the third and the fourth lumbar vertebrae. Also called **belly button, navel. —umbilical,** *adj.*

umbo [L, knob], a projection on any rounded surface, such as the inner surface of the tympanic membrane where the malleus is attached.

umbrella filter /umbrəl′ə/, a small, porous, umbrella-shaped device that can be inserted into the vena cava or other blood vessel to trap blood clots. It is used in patients who have contraindications to anticoagulation or who have failed anticoagulation.

un-, prefix meaning "not": *unconscious.*

uncal [L, *uncus,* hook], pertaining to the uncus.

uncal herniation /ung′kəl/ [L, *uncus,* hook, *hernia,* rupture], a condition in which the medial part of the temporal lobe protrudes over the tentorial edge as a result of increased intracranial pressure. If uncorrected, the progressive disorder causes pressure on the brainstem after first impinging on the third cranial nerve. A dilated pupil on the side of the herniation is a diagnostic sign of the disorder.

Uncertainty in Illness Theory. See **Mishel, Merle H.**

unciform bone. See **hamate bone.**

Uncinaria /un′siner′ē·ə/ [L, *uncinus,* hook], a genus of nematode that causes hookworm in dogs, cats, and other carnivores.

uncinate /un′sināt/, having hooks or barbs.

uncipressure /un′sipresh′ər/, pressure with a hook to control a hemorrhage.

uncompensated care /unkom′pənsā′tid/ [ME, *un,* against, not; L, *compendere,* to be equivalent], services provided by a hospital or other health care professional for which no charge is made and for which no payment is expected.

uncompensated gluteal gait. See **Trendelenburg gait.**

uncompetitive inhibitor /un′kəmpet′itiv/ [ME, *un* + L, *competere,* to compete, *inhibere,* to restrain], an enzymatic inhibitor that appears to bond only to the enzyme-substrate complex and not to free enzyme molecules.

uncomplemented, not united with proteins of the body's immune system and therefore inactive.

unconditioned response /un′kəndish′ənd/ [ME, *un* + L, *conditio,* condition, *respondere,* to reply], a normal, instinctive, unlearned reaction to a stimulus; one that occurs naturally and is not acquired by association and training. Also called **inborn reflex, instinctive reflex,** *unconditioned reflex.* Compare **conditioned response.**

unconjugated, not chemically bound in the serum.

unconjugated bilirubin, the majority of bilirubin in plasma. See **bilirubin.**

unconjugated monoclonal antibody /unkon′jəgā′tid/, one of a population of antibodies produced from a single clone of B lymphocytes and used for highly selective targeting of tumor cells. The antibodies can destroy malignant cells by direct lysis, by binding to cell receptors, and by mobilization of various killer cells.

unconscious /unkon′shəs/ [ME, *un* + L, *conscire,* to be aware], **1.** unaware of the surrounding environment; insensible; incapable of responding to sensory stimuli. **2.** (in psychiatry) the part of the mental function in which thoughts, ideas, emotions, or memories are beyond awareness and rarely subject to ready recall. It contains data that have never been conscious or that were conscious at one time, usually for a brief period, and later repressed. Compare **preconscious.** See also **collective unconscious, personal unconscious.**

unconsciousness /unkon′shəsnəs/, a state of complete or partial unawareness or lack of response to sensory stimuli as a result of hypoxia caused by respiratory insufficiency or shock; from metabolic or chemical brain depressants such as drugs, poisons, ketones, or electrolyte imbalance; or from a form of brain pathological condition such as trauma, seizures, cerebrovascular accident, brain tumor, or infection. Various degrees of unconsciousness can occur during stupor, fugue, catalepsy, and dream states. See also **coma.**

unction. See **ointment.**

uncus /ung′kəs/ [L, hook], **1.** the hooklike anterior end of the hippocampal gyrus on the temporal lobe of the brain. **2.** a hook-shaped structure.

undecylenic acid /un′desilen′ik/, a topical antifungal agent.
■ INDICATIONS: It is prescribed in the treatment of athlete's foot and ringworm.
■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. It is not used in the eyes or on mucous membranes. Caution is advised when the patient is diabetic.
■ ADVERSE EFFECTS: Among the more serious adverse effects are skin irritation and hypersensitivity reactions.

underactive bladder, a condition in which bladder contraction is not of sufficient duration or magnitude to empty the bladder completely.

undercut, **1.** the part of a tooth or artificial crown that lies between the height of contour and the gingivae, only if that part has a smaller diameter than the height of the contour. **2.** the contour of a cross section of a residual ridge that would prevent the placement of a denture or other prosthesis. **3.** the contour of flasking stone that interlocks so as to prevent the separation of parts. **4.** the part of a prepared cavity that creates a mechanical lock or area of retention. It may be desirable in a cavity to be filled with gold foil or amalgam but is undesirable in a cavity prepared for a restoration to be cemented.

underdamping /un′dərdam′ping/ [AS, *under,* beneath, *dampen,* to check], the transmission of all frequency components in electrocardiography without a reduction in amplitude.

underlying assumption /un′dərlī′ing/, a set of rules one holds about oneself, others, and the world. These rules are regarded by the individual as unquestionably true.

undernutrition /-no͞otrish′ən/, malnutrition caused by an inadequate food supply or an inability to use the nutrients in food.

underwater exercise /un′dərwô′tər/ [AS, *under* + *woeter*], any physical activity performed in a pool or large tub, such as a Hubbard tank, where the buoyancy of the water facilitates the movement of weak or injured muscles. Also called **aquatherapy, aquatic exercise.** See also **exercise.**

underwater seal, a seal formed by water allowed to flow over a tube that exits from the chest cavity of a patient. The water acts as a one-way valve and permits the outflow of air but prevents the ingress of air. Also called **water trap.**

underweight /un′dərwāt′/ [AS, *under* + *wiht*], **1.** a body mass index of less than 18.5. See also **body mass index.** **2.** less than normal in body weight after adjustment for height, body build, and age.

undescended testis. See **cryptorchidism, monorchism.**

undifferentiated cell /undif′əren′shē·ā′tid/ [AS, *un,* not; L, *differentia,* difference, *cella,* storeroom], a cell that has not yet expressed signs of its future specific type.

undifferentiated cell leukemia. See **stem cell leukemia.**

undifferentiated family ego mass, an emotional fusion in a family in which all members are similar in emotional expression and know each others' thoughts, feelings, and fantasies.

undifferentiated malignant lymphoma [ME, *un* + L, *differe,* to differ, *atus,* process, *malignus,* evil, *lympha,* water; Gk, *oma,* tumor], a lymphoid neoplasm containing stem cells that have large nuclei, a small amount of pale cytoplasm, and ill-defined borders. Also called **reticulosarcoma, stem cell lymphoma.**

undifferentiation /un′difəren′shē·ā′shən/, the lack or absence of normal cell differentiation into an identifiable cell type. **—undifferentiated,** *adj.*

undisplaced fracture /un′displāst, un′displāst′/, a bone break in which cracks in the bone may radiate in several directions but the bone fragments do not separate.

undoing /undo͞o′ing/ [ME, *un* + AS, *don*], the performance of a specific action that is intended to negate in part a previous action or communication. According to some psychologists, undoing is related to the magical thinking of childhood. For example, a spouse brings home flowers after having a lunchtime affair with another person.

undulant /un′dyələnt/ [L, *unda,* wave], wavelike, such as a vibration, fluctuation, or oscillation.

undulant fever. See **brucellosis.**

undulate /un′dyəlit/, to have wavelike fluctuations or oscillations.

undulating pulse /un′dyəlā′ting/, a pulse characterized by a succession of waves without force.

unengaged head /un′engājd′/ [ME, *un* + Fr, *engager,* to involve; AS, *heafod*], the head of a floating fetus. See also **ballottement, engagement.**

unequal cleavage /unē′kwəl/ [ME, *un* + L, *aequare,* to make equal; AS, *cleofan,* to split], mitotic division of a fertilized ovum into blastomeres that are larger near the yolky part of the cell (the vegetal pole) and smaller near the nucleus (the animal pole). Compare **equal cleavage.**

unequal pulse [AS, *un,* not; L, *aequare,* to make equal, *pulsare,* to beat], a pulse in which the beats vary in intensity.

unequal twins, two nonjoined fetuses born of the same pregnancy in which only one of the pair is fully formed, with the other showing various degrees of developmental defects.

unfinished business /unfin′isht/, the concerns of a dying patient that require resolution before death can be accepted by the patient. Unfinished business may range from financial matters to personal relationships.

ung., abbreviation for the Latin word *unguentum,* "unguenta," or "ointment."

ungual /ung′gwəl/, pertaining to the fingernails.

ungual phalanx. See **distal phalanx.**

unguent. See **ointment.**

unguis. See **nail.**

unheated serum reagin test, a modification of the VDRL test using unheated serum, used primarily for screening. Also called **USR test**.

uni- /yo͞o′nē-/, prefix meaning "one or single": *unicellular, unipara, unipolar.*

uniaxial joint /yo͞o′nē·ak′sē·əl/ [L, *unus,* one, *axis,* axle, *jungere,* to join], a synovial joint in which movement is only in one axis, such as a pivot or hinge joint.

unicaliceal kidney, a kidney with a single papilla, calyx, and collecting system.

UNICEF /yo͞o′nisef′/, abbreviation for **United Nations International Children's Emergency Fund.**

unicellular reproduction. See **parthenogenesis.**

unicentric blastoma. See **blastoma.**

unicuspid. See **cuspid.**

unidirectional block /-direk′shənəl/ [L, *unus* + *dirigere,* to direct; Fr, *bloc*], a pathological failure of cardiac impulse conduction in one direction while conduction is possible in the opposite direction.

unidisciplinary health care team /-dis′ipliner′ē/, a group of health care workers who are members of the same discipline.

unification model /-kā′shən/ [L, *unus* + *ficare,* to make whole, *atus,* process, *modulus,* small measure], a theoretic framework based on the close relationship of nursing education and clinical nursing service at the University of Rochester (New York). The faculty of the school of nursing hold joint appointments to the school and the hospital, teaching nursing students and providing clinical leadership in nursing service in the hospital. See also **joint appointment.**

uniform /yo͞o′nifôrm/, **1.** having only one form or shape. **2.** distinctive clothing worn by members of a group.

uniform reporting, the reporting of service and financial data by a hospital in conformance with prescribed standard definitions to permit comparisons with other health facilities.

unilaminar /-lam′inər/, composed of only one layer.

unilateral /-lat′ərəl/ [L, *unus,* one, *latus,* side], involving only one side.

unilateral denture. See **partial denture.**

unilateral hypertrophy [L, *unus* + *latus,* side; Gk, *hyper,* above, *trophe,* nourishment], enlargement of one side or a part of one side of the body.

unilateral long-leg spica cast, an orthopedic cast applied to immobilize one leg and the trunk of the body cranially as far as the nipple line. It is used to treat a fractured femur or for the correction or the maintenance of the correction of a hip deformity. See also **cast.** Compare **bilateral long-leg spica cast, one-and-a-half spica cast.**

unilateral neglect management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as protecting and safely reintegrating the affected part of the body while helping the patient adapt to disturbed perceptual abilities. See also **Nursing Interventions Classification.**

unilateral paralysis. See **hemiplegia.**

unilobular /-lob′yələr/, having only one lobe.

unilocular /-lok′yələr/, having only one locus, chamber, or cell.

unimolecular reaction. See **monomolecular elimination reaction.**

uninterrupted suture /unin′tərup′tid/ [AS, *un,* not; L, *interrumpere,* to sever, *sutura*], a continuous suture running forward and backward without interruption.

uniocular diplopia. See **monocular diplopia.**

uniocular squint. See **monocular strabismus.**

uniocular vision. See **monocular vision.**

union /ūn′yən/ [L, *unio*], the process of healing; the renewal of continuity in a broken bone or between the edges of a wound. See also **healing.**

uniovular /yo͞o′nē·ov′yələr/ [L, *unus* + *ovum,* egg], developing from a single ovum, as in monozygotic twins as contrasted with dizygotic twins. Compare **binovular.**

uniovular twins. See **monozygotic twins.**

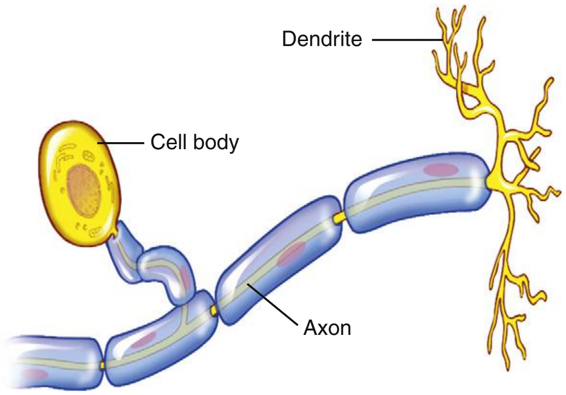
Unipen, a trademark for an antibiotic **(nafcillin sodium).**

unipolar /-pō′lər/ [L, *unus,* one, *polus*], pertaining to a nerve cell with only one pole, such as a nerve cell in which the axon and dendrite are fused into a single process a short distance from the cell body.

unipolar depression, a major disorder of mood that is characterized by symptoms of depression only. See also **depression, major depressive disorder.**

unipolar disorder. See **major depressive disorder.**

unipolar electrocautery. See **monopolar electrocautery.**



Unipolar neuron

unipolar lead [L, *unus* + *polus,* pole; AS, *laedan,* to lead], **1.** an electrocardiographic conductor in which the exploring electrode is placed on the precordium or a limb while the indifferent electrode is in the central terminal. **2.** *(informal)* a tracing produced by such a lead on an electrocardiograph.

unique radiolytic product /yo͞onēk′/, a product such as a food substance that has undergone chemical changes as a result of exposure to ionizing radiation.

uniseptate /-sep′tāt/, having only one septum.

unisex /yo͞o′niseks/ [L, *unus,* one, *sexus,* sex], **1.** concerning only one sex or having reproductive organs of only one sex. **2.** an interchange of sex roles in clothing and hair styles, work assignments, shared restrooms, and activities, such as encouraging boys to play with dolls.

unit (U) /yo͞o′nit/ [L, *unus*], **1.** a single item. **2.** a quantity designated as a standard of measurement. **3.** an area of a hospital that is staffed and equipped for treatment of patients with a specific condition or other common characteristics.

unitary human conceptual framework /yo͞o′niter′ē/, a complex theory in nursing that emphasizes the importance of holistic health care and an understanding of the human being in relation to the universal environment.

unit clerk, a person who performs routine clerical and reception tasks in a hospital inpatient care unit. Also known as unit secretary.

unit dose, a method of preparing medications in which individual doses of patient medications are prepared by the pharmacy and delivered in individual labeled packets to the patient's unit to be administered by the nurses on an ordered schedule. One intent of unit dose is to decrease administration error.

Unit-dose medication *(Potter et al, 2011)*

unit-dose system, a system of drug distribution in which a portable cart containing a drawer for each patient's medications is prepared by the hospital pharmacy with a 24-hour supply of the medications.

United Nations International Children's Emergency Fund (UNICEF) /yo͞o′nisef′/, a fund established by the General Assembly of the United Nations in 1946 to aid children in devastated areas of the world. It is funded by contributions from the member nations. It acts to prevent disease, including tuberculosis, whooping cough, and diphtheria, and provides food and clothing to needy children in more than 50 countries. In 1953, UNICEF was made a permanent organization of the United Nations.

United Network for Organ Sharing (UNOS) /yo͞o′nos/, a national organization for the collection and distribution of body organs that can be used in transplants. Hospitals advise relatives of newly deceased patients about the availability of UNOS service in arranging organ donations.

United States Medical Licensing Examination®, the standardized three-step examination for medical licensure in the United States sponsored by the Federation of State Medical Boards (FSMB) and the National Board of Medical Examiners®.

***United States Pharmacopeia* (USP),** a compendium recognized officially by the Federal Food, Drug, and Cosmetic Act that contains descriptions, uses, strengths, and standards of purity for selected drugs and for all of their forms of dosage.

United States Public Health Service (USPHS), an agency of the federal government responsible for the control of the arrival from abroad of any people, goods, or substances that may affect the health of U.S. citizens. The agency sets standards for the domestic handling and processing of food and the manufacture of serums, vaccines, cosmetics, and drugs. It supports and performs research, aids localities in times of disaster and epidemics, and provides medical care for certain groups of Americans.

unit of blood, a standard measure of approximately 450-500 mL of whole blood.

unit of service, any individual, family, aggregate, organization, or community given nursing care. The level at which service is delivered varies with the particular unit entity.

univalent. See **monovalent.**

univalent antiserum. See **antiserum.**

univalent reduction, a phenomenon during intracellular metabolism involving oxygen-reduction reactions in which superoxide radicals are produced because oxygen accepts electrons only one at a time. In the short period between acceptance of the first and second electrons, one electron is unpaired and oxygen is a superoxide radical. The superoxide may then be converted to a second free radical.

Univasc, a trademark for an angiotensin-converting enzyme inhibitor **(moexipril).**

universal /yo͞o′nivur′səl/ [L, *universus,* whole world], occurring everywhere and in all things.

universal antidote [L, *universus,* whole world; Gk, *anti,* against, *dotos,* something given], a mixture of 50% activated charcoal, 25% magnesium oxide, and 25% tannic acid, formerly thought to be useful as an antidote for most types of acid, heavy metal, alkaloid, and glycoside poisons. It is now believed that the mixture is no more effective than activated charcoal given with water.

universal choking signal. See **Heimlich sign.**

universal cuff, an adaptive device worn on the hand to hold items such as utensils, shaver, or pencil, allowing a patient with a weak grasp to participate more in self-care.

universal donor, type O, Rh negative red blood cells that may be used for emergency transfusion to any ABO type with minimal risk of incompatibility. Group AB plasma can be transfused to all ABO types. See also **blood donor, blood group, transfusion.**

universalizability principle /yo͞o′nivur′səlī′zəbil′itē/, a principle that an act is good if everyone should, in similar circumstances, do the same act without exception.

Universal Precautions, precautions designed preventing the transmission of blood-borne diseases such as human immunodeficiency virus, hepatitis B, and other blood-borne pathogens when first aid or health care is provided. Under Universal Precautions, blood and certain body fluids of all patients are considered potentially infectious. Universal Precautions were initially developed in 1987 by the Centers for Disease Control and Prevention in the United States and in 1989 by the Bureau of Communicable Disease Epidemiology in Canada. The Precautions include specific recommendations for use of gloves, gowns, masks, and protective eyewear when contact with blood or body secretions containing blood is anticipated. Compare **Standard Precautions, transmission-based precautions.**

universal qualifiers, in neurolinguistic programming, the use of terms that give general impressions of limitations, such as *all, common, every, only,* and *never.*

universal recipient [L, *universus* + *recipere,* to receive], a person with blood type AB, who can receive a transfusion of any blood type without agglutination or precipitation effects.

universal tooth coding system, a tooth-numbering system in which the secondary teeth are numbered from 1 (the maxillary right third molar) to 32 (the mandibular right third molar). The primary teeth are similarly numbered from 1 to 20, with the numbers preceded by the letter D (for deciduous). The universal tooth coding system is similar to the ADA numbering system, except that the latter uses the letters A to T to identify the deciduous teeth. See also **FDI numbering system, Palmer notation.**

University of Wisconsin solution, a preservation solution used to flush organs before cold storage and before transplantation to prevent cold-induced cell injury.

unlicensed assistive personnel, health care workers who are not licensed but are prepared to provide certain elements of patient care under the supervision of a registered nurse. Unlicensed assistive personnel include patient care technicians, nurses' aides, and certified nursing assistants.

UNLS, abbreviation for *Unified Nursing Language System.*

unmedullated. See **unmyelinated.**

unmodified scattering. See **scattering.**

unmyelinated /unmī′əlinā′tid/ [AS, *un,* not; Gk, *myelos,* marrow], describing a nerve fiber that is not coated with a myelin sheath. An unmyelinated fiber, lacking the whitish sheath, appears as gray matter in the brain.

Unna's paste boot /o͞o′nəz/ [Paul G. Unna, German dermatologist, 1850–1929; L, *pasta,* paste; ME, *bote*], a dressing for varicose ulcers formed by applying a layer of a gelatin-glycerin-zinc oxide paste to the leg and then a spiral bandage covered with successive coats of paste to produce a rigid boot.

unoprostone /u′no-pros′tōn/, an antiglaucoma agent that decreases elevated intraocular pressure by increasing the outflow of aqueous humor. It is used as *unoprostone isopropyl* in the treatment of open-angle glaucoma and ocular hypertension. It is applied topically to the conjunctiva.

UNOS /yo͞o′nos/, abbreviation for **United Network for Organ Sharing.**

unresolved grief /un′rizolvd′/, a severe, chronic sorrow reaction in which a person does not complete the resolution stage of the mourning process within a reasonable time.

unroofed coronary sinus, congenital complete or partial absence of the partition dividing the coronary sinus from the left atrium, allowing the shunting of blood from the left atrium through the coronary sinus into the right atrium.

unsaturated /unsach′ərātid/ [ME, *un* + L, *saturare,* to fill], **1.** *adj,* describing a solution that is capable of dissolving more of the solute; not saturated. **2.** *n,* an organic compound in which one or more pairs of carbon atoms are united by double or triple bonds, as in unsaturated fatty acids. Also called **unsaturated hydrocarbon.** Compare **saturated.**

unsaturated alcohol, an alcohol derived from an unsaturated hydrocarbon, such as an alkene or olefin. Allyl alcohol is an example.

unsaturated compound [AS, *un,* not; L, *saturare,* to fill, *componere,* to put together], a chemical compound that contains double or triple bonds.

unsaturated fatty acid, a fatty acid in which some of the carbon atoms in the hydrocarbon chain are joined by double or triple bonds. These bonds are easily modified in chemical reactions, either by conversion to other functional groups or for conjugation to other molecules. Monounsaturated fatty acids have only one double or triple bond per molecule and are found as components of fats (triglycerides) in such foods as fowl, almonds, pecans, cashew nuts, peanuts, and olive oil. Polyunsaturated fatty acids have more than one double or triple bond per molecule and are found in fish, corn, walnuts, sunflower seeds, soybeans, cottonseeds, and safflower oil. Diets high in polyunsaturated fatty acids and low in saturated fatty acids have been correlated with low serum cholesterol levels in some study populations. Compare **saturated fatty acid.**

unsaturated hydrocarbon. See **unsaturated.**

unscrubbed team members /unskrubd′/, the members of a surgical team, including the anesthetist and circulating nurse, who wear surgical attire but are not gowned or gloved and do not enter the sterile field.

unsocialized aggressive reaction /unsō′shəlīzd/ [ME, *un* + L, *socialis,* companion, *aggressio,* an attack, *re,* again + *agere,* to act], a behavior disorder of childhood characterized by overt and covert hostility, disobedience, physical and verbal aggression, vengefulness, quarrelsome behavior, and destructiveness, often manifested in acts such as lying, stealing, temper tantrums, vandalism, and physical violence against others.

unstable /unstā′bəl/, **1.** in an excited or active state, such as an atom with a nucleus possessing excess energy. **2.** easily broken down or prone to decomposition.

unstable angina [AS, *un,* not, *stabilis,* firm, *angina,* quinsy], thoracic pain that may mark the onset of acute myocardial infarction. It typically occurs at rest and has a sudden onset, sudden worsening, and stuttering recurrence over days and weeks. It carries a more severe short-term prognosis than stable chronic angina.

unstriated muscle. See **smooth muscle.**

Unverricht's disease /un′vərikts, o͝on′ferishts/ [Heinrich Unverricht, German physician, 1853–1912], an inherited condition characterized by progressive degeneration of gray matter, resulting in myoclonic epilepsy. It appears in patients 8 to 13 years of age and is marked by general neurological and intellectual decline.

unvoiced. See **voiceless.**

upper airway obstruction (UAO), any abnormal condition of the mouth, nose, or larynx that interferes with breathing when the rest of the respiratory system is functioning normally.

upper esophageal sphincter, the upper 3 to 5 cm of the esophagus, including the cricopharyngeus muscle, which prevents the aspiration of air from the pharynx esophagus.

upper extremity suspension, an orthopedic procedure used in the treatment of fractures and in the correction of orthopedic abnormalities of the upper limbs. The procedure uses traction equipment, including metal frames, ropes, and pulleys, to relieve the weight of the involved upper limb rather than to exert traction. Upper extremity suspension is usually unilateral but also may be used bilaterally in postoperative, posttraumatic, or postreduction control of edema. Compare **balanced suspension, lower extremity suspension.**

upper GI (UGI), pertaining to the upper gastrointestinal tract, from the esophagus to and including the duodenum. The term is commonly applied to radiographic or fluoroscopic diagnostic views after ingestion of a barium sulfate solution. Normal findings include normal size, contour, patency, filling, positioning, and transmission of barium through the lower esophagus, stomach, and duodenum. Also called **UGI,** *upper GI series.*

upper GI x-ray study, a series of radiographic films of the upper GI tract, usually with barium sulfate as the contrast medium.

upper level discriminator (ULD), an electronic device used in nuclear medicine to discriminate against all radionuclide pulses whose heights are above a given level.

upper motor neuron paralysis, an injury to or lesion in the brain or spinal cord that causes damage to the cell bodies, axons, or both of the upper motor neurons, which extend from the cerebral centers to the cells in the spinal column. Clinical manifestations include weakness or paralysis; increased muscle tone and spasticity of the muscles involved with little or no atrophy; hyperactive deep tendon reflexes; diminished or absent superficial reflexes; the presence of pathological reflexes, such as Babinski's and Hoffmann's reflexes; and no local twitching of muscle groups. Compare **lower motor neuron paralysis.**

upper pole of kidney. See **poles of kidney.**

upper pole ureter, the ureter draining the upper pole of a duplex kidney.

upper respiratory tract (URT), one of the two divisions of the respiratory system. The URT consists of the nose, nasal cavity, ethmoidal air cells, frontal sinuses, sphenoidal sinuses, maxillary sinus, larynx, and trachea. The URT conducts air to and from the lungs and filters, moistens, and warms the air during each inspiration. Infection and irritation of the URT are common and often spread to the lower respiratory tract, where they may cause serious complications. Compare **lower respiratory tract.** See also **larynx, nose, trachea.**

upper respiratory tract infection. See **respiratory tract infection.**

UPPP, abbreviation for **uvulopalatopharyngoplasty.** See **palatopharyngoplasty.**

up-regulation /up reg-u-la′shun/, increase in expression of a gene; in the narrowest sense, that in which transcription of a specific mRNA is increased, but also used more broadly to refer to an increase in mRNA levels for a particular gene from any cause, such as increased stability of the specific mRNA. See also **down-regulation**.

upsilon /yo͝op′silon, up′-/, Y, υ, the twentieth letter of the Greek alphabet.

uptake /up′tāk/ [AS, *uptacan*], the drawing up or absorption of a substance.

upward-and-downward squint. See **vertical strabismus.**

ur-. See **uro-.**

UR, abbreviation for **utilization review.**

urachal diverticulum, a usually asymptomatic type of vesical diverticulum resulting from a urachus that has closed at the umbilical end but not at the bladder end. It is seen most often in children, those with prune-belly syndrome, and persons with a bladder outlet obstruction.

urachal sinus, dilation of part of the urachus at the umbilical end, either congenitally or as a result of a urachal cyst that has begun to drain to the surface.

urachus /yo͞or′əkəs/ [Gk, *ourachos,* urinary tract], in the fetus, an epithelial tube connecting the apex of the urinary bladder with the umbilicus. It persists throughout life as the median umbilical ligament.

uracil, a pyrimidine base found in RNA. Pairs with **adenine.** See also **thymine.**

-uracil, suffix for uracil derivatives used as thyroid antagonists and as antineoplastics: *fluorouracil*.

uragogue, an agent that increases production of urine.

uraniscus. See **palate.**

uranium (U) /yo͞orā′nē·əm/ [planet Uranus], a heavy, radioactive metallic element. Its atomic number is 92; its atomic mass is 238.03. Uranium is the heaviest of the natural elements. Isotopes of uranium are used in nuclear power plants to provide neutrons for the nuclear reactions that result in release of energy. Uranium compounds have been used to impart an orange color to glass.

urano-, combining form meaning "the palate": *uranoplasty, uranoplegia, uranoschism*.

uranoschisis /yo͞o′rənos′kisis/ [Gk, *ouranos,* palate, *schisis,* fissure], cleft palate.

uranostaphyloplasty /-staf′ilōplas′tē/ [Gk, *ouranos,* palate, *staphyle,* uvula, *plassein,* to mold], the surgical repair of a cleft palate.

uranostaphyloschisis /yo͞o′rənōstaf′ilos′kisis/, a fissure that extends from the hard palate to the soft palate.

urarthritis, inflammation of a joint caused by gout.

urate /yo͝or′āt/, any salt of uric acid, such as sodium urate. Urates are found in urine, blood, and tophi or calcareous deposits in tissues. They also may be deposited as crystals in joints. See also **gout, uric acid.**

uraturia /yo͝or′əto͝or′ē·ə/, the presence of uric acid salts in the urine.

urban typhus. See **murine typhus.**

urceiform /o͞orsē′ifôrm/, pitcher-shaped.

Ur-defenses /o͞or′ dəfen′səs/, a set of three fundamental beliefs essential for psychological integrity of the individual, as proposed by Jules Masserman. They are a delusion of invulnerability and immortality, faith in a celestial order, and a wishful fantasy that fellow human beings are potential friends available for mutual service.

urea /yo͝or′ē·ə/ [Gk, *ouron,* urine], a normal metabolic waste product from protein metabolism, used as a systemic osmotic diuretic and topical emollient.

■ INDICATIONS: It is prescribed systemically to reduce cerebrospinal and intraocular fluid pressure and is used topically as a keratolytic agent.

■ CONTRAINDICATIONS: Severely impaired kidney function, active intracranial bleeding, marked dehydration, or liver damage prohibits its systemic use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are pain and necrosis at the site of injection, headache, GI disturbances, and dizziness. There are no known severe reactions to topical use.

-urea, suffix meaning a "compound containing urea": *glycolylurea, plenylurea, solurea*.

urea concentration test, a test of renal efficiency based on the fact that urea is absorbed rapidly from the stomach into the blood and is excreted unaltered by the kidneys. 15 g of urea is given with 100 mL of fluid, and the urine collected after 2 hours is tested for urea concentration.

urea cycle, a series of complex enzymatic reactions by which ammonia is detoxified in the liver. In the series of steps for disposing of the ammonia molecule, a waste product of protein metabolism, five enzymatic reactions occur as NH_2 radicals are combined with carbon and oxygen atoms from carbon dioxide to form urea, which is excreted. The amino acid arginine is synthesized during the same process. Also called **Krebs-Henseleit cycle.**

ureagenesis /yo͝or′ē·əjen′əsis/, the process by which urea becomes the final waste product of amino acid metabolism and the detoxification of ammonia from the blood.

urea nitrogen. See **blood urea nitrogen.**

urea nitrogen appearance, the amount of urea in grams produced by a person's body over a specific period of time, closely related to the amount of nitrogen that has not been absorbed by the body. It is calculated as the sum of the urea excreted in the urine plus that found in the blood by calculating blood urea nitrogen. A low figure indicates efficient use of dietary protein. The person's intake of protein must also be known because a low urea nitrogen appearance is also seen with a low protein diet or malnutrition.

urea nitrogen blood (BUN) test, a blood test that detects levels of urea nitrogen in the blood, which serve as an index of liver and kidney function and indicate diseases of these organs as well as other conditions that affect their function. BUN is interpreted in conjunction with the creatinine test as in a series known as renal function tests.

Ureaplasma urealyticum /-plaz′mə/, a sexually transmitted microorganism that is a common inhabitant of the urogenital systems of men and women in whom infection is asymptomatic. Neonatal death, prematurity, and perinatal morbidity are statistically associated with colonization of the chorionic surface of the placenta by *Ureaplasma urealyticum*. The mechanisms by which the unfavorable effects on pregnancy occur are not understood. There is no characteristic lesion in the fetus or newborn. Treatment involves oral tetracyclines administered for a period of at least 7 days.

urea rebound, a sudden increase in release of urea into the bloodstream by cells and organs that normally store it, seen in the first 15 minutes to an hour after urea has been removed by dialysis. This is caused by flow-volume dysequilibrium.

urea reduction ratio (URR), the fractional reduction in blood urea nitrogen during a single hemodialysis session, expressed as a percent, measured to assess adequacy of hemodialysis.

urease /yo͝or′ē·ās/, **1.** an enzyme used in the determination of urea in the blood or urine. **2.** an enzyme that catalyzes the hydrolysis of urea to carbon dioxide and ammonia. **3.** an antitumor enzyme.

Urecholine, a trademark for a cholinergic **(bethanechol chloride).**

uremia /yo͝orē′mē·ə/ [Gk, *ouron* + *haima,* blood], the presence of excessive amounts of urea and other nitrogenous waste products in the blood, as occurs in renal failure. Also called **azotemia.** See also **chronic glomerulonephritis, subacute glomerulonephritis. —uremic,** *adj*.

uremic breath, the peculiar odor of the breath in uremic stomatisis.

uremic coma [Gk, *ouron,* urine, *koma,* deep sleep], a stuporous condition resulting from acidosis and the toxic effects of uremia.

uremic convulsion, an episode of involuntary muscle contractions caused by uremia or retention in the blood of substances that would normally be excreted by the kidneys.

uremic frost, a pale frostlike deposit of white crystals on the skin caused by kidney failure and uremia. Urea compounds and other waste products of metabolism that cannot be excreted by the kidneys into the urine are excreted through the small superficial capillaries into the skin, where they collect on the surface.

uremic gingivitis. See **nephritic gingivitis.**

uremic syndrome, the spectrum of symptoms accompanying uremia.

-uret, suffix designating a binary compound: *bromuret, phosphuret, sulphuret*.

ureter /yŏŏr′ətər, yŏŏrē′tər/ [Gk, *oureter*], one of a pair of tubes, about 30 cm long, that carries urine from the kidney into the bladder. Each tube is composed of a fibrous, a muscular, and a mucous coat and divides into an abdominal part and a pelvic part. The abdominal part lies behind the peritoneum on the medial side of the psoas major and enters the pelvic cavity by crossing either the termination of the common iliac artery or the commencement of the external iliac artery. In men the pelvic part of the ureter runs caudally along the lateral wall of the pelvic cavity and reaches the lateral angle of the bladder just ventral to the upper tip of the seminal vesicle. In women the pelvic part of the ureter forms the posterior boundary of the ovarian fossa and runs medially and ventrally along the upper part of the vagina. The ureter enters the bladder through a tunnel that functions as a valve to prevent backflow of urine into the ureter when the bladder contracts. Connecting with the kidneys, the ureters expand into funnel-shaped renal pelves that branch into calyces. Urine is pumped through the ureters by peristaltic waves that occur an average of three times a minute. **—ureteral,** *adj*.

ureter-, uretero-, prefix meaning "ureter": *ureterorrhagia, ureterosigmoidoscopy, ureterostenosis*.

ureteral. See **ureter.**

ureteral duplication, double ureter.

ureteral dysfunction /yŏŏrē′terəl/ [Gk, *oureter* + *dys*, bad; L, *functio*, performance], a disturbance of the normal peristaltic flow of urine through a ureter, resulting from dysfunction of ureteral motor nerves. See also **megaloureter.**

ureteral jet, the pattern of fluid seen when dense urine from the ureter is expelled into the more dilute urine in the bladder; it can be studied to assess function and patency of the ureter.

ureteral orifice, the opening of a ureter into the urinary bladder at one corner of the trigone of the bladder. Also called *ureteral meatus*.

ureteral reimplantation, ureteroneocystostomy.

ureteral stent, a stent inserted into the ureter to maintain patency in stenosis or in healing after trauma or surgery.

uretercystoscope /yŏŏr′ētər-sis′təskōp′/ [Gk, *oureter*, ureter, *kystis*, bladder, *skopein*, to view], a cystoscope equipped with ureteric catheters that can be inserted into either ureter.

ureteritis /yŏŏrē′tərī′tis/ [Gk, *oureter* + *itis*], an inflammatory condition of a ureter caused by infection or by the mechanic irritation of a stone.

uretero-. See **ureter-.**

ureteroarterial fistula, a rare, life-threatening fistula that communicates between a ureter and a nearby artery, usually seen as a complication of a surgical procedure of the ureter.

ureterocele /yŏŏrē′tərōsēl′/ [Gk, *oureter* + *kele*, hernia], a prolapse of the terminal part of the ureter into the bladder. The condition may lead to obstruction of the flow of urine, hydronephrosis, and loss of renal function. Cystoscopy and pyelography reveal the prolapsed ureter. Surgical correction is performed to prevent permanent damage to the kidney. Compare **cystocele.**

ureterocolonic anastomosis, anastomosis of a ureter to part of the colon, either a detached segment or an in situ segment, so that urine empties into the colon, sometimes as a continent urinary diversion. Also called *ureterocolostomy*.

ureterography /yŏŏrē′tərog′rəfē/ [Gk, *oureter* + *graphein*, to record], the radiological imaging of a ureter, usually conducted as part of an examination of the urinary tract. The examination may involve injection of a radiopaque medium through a urinary catheter with the aid of a ureterocystoscope (the ascending method), or by IV injection of a contrast medium that permits the filtering of the substance through the kidneys (the descending method) to the ureters.

ureterohydronephrosis. See **hydronephrosis.**

ureterolysis, the rupture of a ureter.

ureteropelvic /u-re′ter-o-pel′vik/, relating to the ureter and renal pelvis. Also called *pelviureteral*.

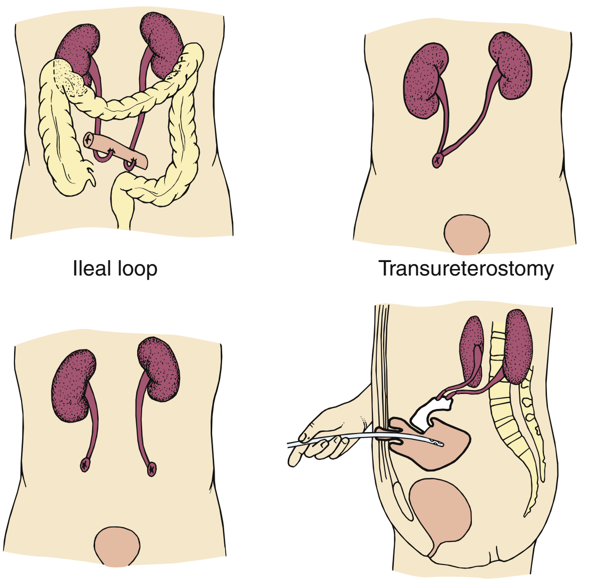
ureteropelvic junction, the area where the renal pelvis meets the ureter.

ureteroplasty /yŏŏrē′tərōplas′tē/ [Gk, *oureter* + *plassein*, to mold], a surgical procedure performed to restructure a ureter, such as when a stricture blocks the normal flow of urine.

ureteropyelonephritis /-pī′əlō′nəfrī′tis/ [Gk, *oureter* + *pyelos*, pelvis, *nephros*, kidney, *itis*, inflammation], an inflammation of the kidney, pelvis, and ureter.

ureterosigmoidostomy /-sig′moidos′təmē/ [Gk, *oureter* + *sigma*, S-shaped, *eidos*, form, *stoma*, mouth], a surgical procedure in which a ureter is implanted in the sigmoid flexure of the intestinal tract. Also called *ureterosigmoid anastomosis*.

ureterostomy /-os′təmē/ [Gk, *oureter* + *stoma*, mouth], the surgical creation of a new opening through which a ureter empties onto the surface of the body or into another outlet.



Ileal loop

Transureterostomy

Double ureterostomy

Continent urinary diversion

Ureterostomy *(Potter and Perry, 2007)*

ureterotomy, an incision into a ureter.

ureterovaginal /-vaj′inəl/, pertaining to the ureters and vagina.

ureterovascular hydronephrosis, hydronephrosis caused by crossed vessels next to the kidney that compress or deform the renal pelvis.

urethra /yo͝orē′thrə/ [Gk, *ourethra*], a small tubular structure that drains urine from the bladder. In women it is about 3 cm long and lies directly behind the symphysis pubis, anterior to the vagina. In men it is about 20 cm long and begins at the bladder, passes through the center of the prostate gland, goes between two sheets of tissue connecting the pubic bones, and finally passes through the urinary meatus of the penis. In men the urethra is joined by the ejaculatory duct and serves as a passageway for semen during ejaculation, as well as a canal for urine during voiding. See also **ureter. —urethral,** *adj*.

urethral. See **urethra.**

urethral angle, the angle at which the urethra exits the bladder neck.

urethral atresia, imperforation of the urethra.

urethral caruncle [Gk, *ourethra* + L, *caruncula,* small piece of flesh], a small, painful growth in the mucous membrane of the female urethral meatus. It may be a source of bleeding.

urethral crest, a longitudinal midline fold of mucosa that marks the lumen of the urethra in men.

urethral diverticula. See **urethrocele.**

urethral diverticulum, an outpouching of tissue from the urethra into the potential space surrounding the urethra. It occurs predominantly in women and is associated with chronic urological conditions. The cause is uncertain and symptoms are variable, the most common being frequency, urgency, and dysuria. Formerly called **scaphoid megalourethra.**

urethral duplication, double urethra.

urethral folds, a pair of folds derived from the cloacal folds. In male embryos they close over the urethral plate and fuse to form the spongy urethra and ventral aspect of the penis, and in female embryos they fuse only anterior to the anus and form the labia minora.

urethral hematuria [Gk, *ourethra* + *haima,* blood, *ouron,* urine], blood in the urine as a result of a urethral lesion.

urethral orifice, **1.** the external opening of the urethra in the glans penis of a male or the vestibule of a female. **2.** internal opening of the urethra at the anterior and inferior angle of the trigone. Also called **meatus,** *urethral meatus*.

urethral papilla. See **papilla.**

urethral sinus, the depression on either side of the urethral crest into which empty the ducts of the prostate.

urethral sphincter, the voluntary muscle at the neck of the bladder that relaxes to allow urination.

urethral swab [Gk, *ourethra* + D, *zwabber*], an absorbent pad on a slender rod used to treat lesions or to remove secretions.

urethral syndrome, frequency of urination, urgency, and dysuria with no evidence of infection, obstruction, or other urological abnormality. There may also be suprapubic pain and difficulty in initiating and maintaining the urine stream.

urethritis /yo͝or′ithrī′tis/, inflammation of the urethra. The condition is characterized by dysuria and is usually the result of an infection in the bladder or kidneys. An antibiotic, a urinary antiseptic, and an analgesic are usually prescribed after the causative organism is identified by bacteriological culture of a urine specimen. See also **nongonococcal urethritis.**

urethro- /yo͝orē′thrō-/, prefix meaning "urethra": *urethrocele, urethrocystitis, urethrophraxis*.

urethrocele /yo͝orē′thrəsēl/ [Gk, *urethra* + *kele,* hernia], a herniation of the urethra in females. It is characterized by a protrusion of a segment of the urethra and the connective tissue surrounding it into the anterior wall of the vagina. A herniation that is slight and high in the vagina may be palpable only on digital examination when the patient strains downward; one that is large and low in the anterior wall may bulge visibly at the vaginal introitus. A large urethrocele can cause difficulty in voiding, some degree of incontinence, urinary tract infection, and dyspareunia. The condition may be congenital or acquired and may be secondary to obesity, parturition, or poor muscle tone. Surgical repair is the usual treatment. Also called **urethral diverticula.**

urethrocutaneous fistula, a cutaneous fistula between the urethra and the skin, such as after repair of hypospadias or exstrophy of the bladder.

urethrocystitis /yo͝orē′thrōsistī′tis/, inflammation of the urethra and bladder.

urethrocystoscopy /u-re′thro-sis-tos′kah-pe/, cystourethroscopy.

urethrodynia /-din′ē·ə/, pain in the urethra.

urethrography /yo͝or′ēthrog′rəfē/, the radiographic examination of the urethra after the injection of a radiopaque contrast medium into the urethra, usually through a catheter. The procedure may be performed as a part of a radiographic examination of the lower urinary tract.

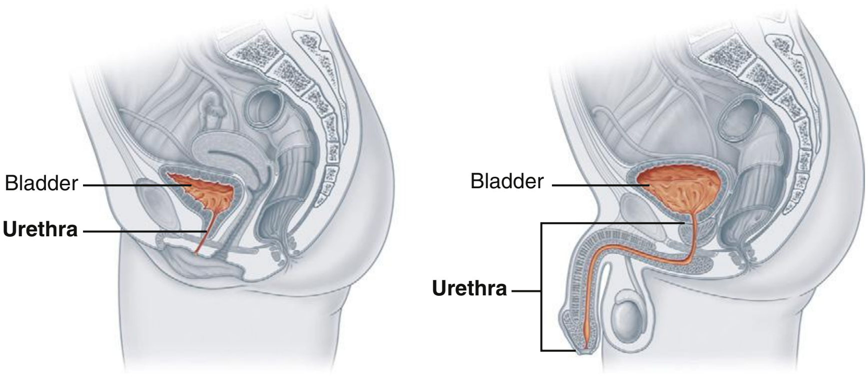
urethroplasty /yo͝orē′thrəplastē′/, a surgical procedure for the repair of a urethra, as in the correction of hypospadias.

urethroscope /-skōp/ [Gk, *ourethra,* urethra, *skopein,* to view], an instrument used to examine the internal surfaces of the urethra.

urethrospasm /-spaz′əm/, a spasm of the musculature of the urethra.

urethrostenosis /-stənō′sis/ [Gk, *ourethra,* urethra, *stenosis,* a narrowing], a stricture of the urethra.

urethrovesical angle, an angle formed by the junction of the bladder wall and the urethra. Analysis of such angles was formerly considered to be a way of gauging the risk for stress incontinence. Also called *vesicourethral angle*.



Course of the urethra *(Drake, Vogl, and Mitchell, 2010)*

Urex, a trademark for a urinary tract antibacterial (methenamine hippurate).

urgency /ur′jensē/ [L, *urgere,* to drive on], a feeling of the need to void urine immediately.

-urgy, suffix meaning the "art of working with (specified) tools": *chemurgy, micrurgy, zymurgy.*

URI, abbreviation for *upper respiratory infection.* See **respiratory tract infection.**

-uria, **1.** suffix meaning the "presence of a substance in the urine": *ammoniuria, calciuria, enzymuria.* **2.** combining form meaning "(condition of) possessing urine": *paruria, polyuria, pyuria.*

uric acid /yŏŏr′ik/, a product of the metabolism of protein that is present in the blood and excreted in the urine. Normal adult levels of blood uric acid range from 2.0 to 8.5 mg/dL, with slightly higher values for elderly patients. See also **gout, kidney, liver, purine, urine.**

uricaciduria /yŏŏr′ikas′idŏŏr′ē·ə/ [Gk, *ouron* + L, *acidus,* sour; Gk, *ouron*], an elevated amount of uric acid in the urine, often associated with urinary calculi or gout.

urico-, prefix meaning "uric acid": *uricocholia, uricosuria, uricotelic.*

uricosuria. See **hyperuricosuria.**

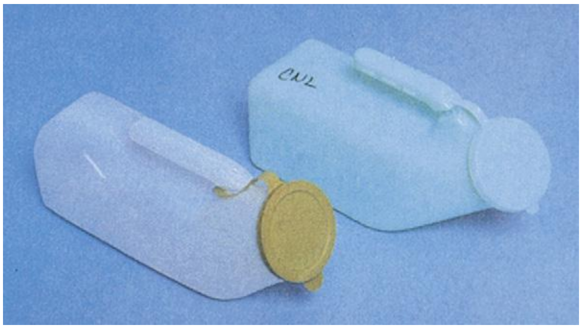
uricosuric drugs /yŏŏr′ikōsŏŏr′ik/ [Gk, *ouron* + L, *acidus,* sour; Gk, *ouron* + Fr, *drogue*], drugs administered to increase the elimination of uric acid.

-uridine, suffix for uridine derivatives used as antiviral agents and as antineoplastics.

urinal /yŏŏr′inəl/, an external plastic or metal receptacle for collecting urine.

urinalysis /yŏŏr′inal′isis/ [Gk, *ouron* + *analysein,* to loosen], a physical, microscopic, or chemical examination of urine. The specimen is physically examined for color, turbidity, and specific gravity. Then it is spun in a centrifuge to allow collection of a small amount of sediment, which is examined microscopically for blood cells, casts, crystals, pus, and bacteria. Chemical analysis may be performed to measure the pH and to identify and measure the levels of ketones, sugar, protein, blood components, and many other substances.

urinary /yŏŏr′iner′ē/, pertaining to urine or the formation of urine.



Urinal *(Potter et al, 2011)*

urinary albumin [Gk, *ouron,* urine; L, *albus,* white], the presence of albumin, a protein, in the urine. Normally protein is not found in the urine because the spaces in the glomerular membrane of the kidney are too small to allow escape of protein molecules. If the membrane is damaged, however, as in some kidney diseases, albumin molecules can leak through into the urine. The following are normal findings: none or as high as 8 mg/dL; 50 to 80 mg/24 hours at rest; less than 250 mg/24 hours after strenuous exercise. Also called **urine protein.** See also **proteinuria.**

urinary bladder [Gk, *ouron* + AS, *blaedre*], the muscular membranous sac in the pelvis that stores urine for discharge through the urethra. It is connected anteriorly with the two ureters and posteriorly with the urethra.

urinary bladder training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as improving bladder function for those with urge incontinence by increasing the bladder's ability to hold urine and the patient's ability to suppress urination. See also **Nursing Interventions Classification.**

urinary calculus, a mineral concretion formed in any part of the urinary tract. Calculi may be large enough to obstruct the flow of urine or small enough to be passed with the urine. Calculi can originate in either the kidneys or the bladder.

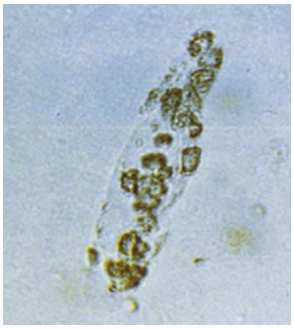
Urinalysis findings

Test	*Normal*	*Abnormal*
Color	Pale to darker yellow	Red may indicate hematuria (possibly urinary obstruction, renal calculi, tumor, kidney failure, cystitis) or renal disease.
Clarity	Clear	Cloudy urine may indicate debris or bacterial sediment (UTI).
pH	4.5-8.0 (average 6.0)	pH is alkaline on standing or with UTI. Acidity is increased with renal tubular acidosis.
Specific gravity	1.007-1.030	Specific gravity usually reflects fluid intake; the less the fluid intake, the higher the specific gravity. If specific gravity remains low (1.010-1.014), renal disease or pituitary disease (deficit of ADH) is suspected.
Protein	0-8 mg/dL	Proteinuria may occur with high-protein diet and exercise (particularly prolonged). It is also seen in renal disease.
Glucose	None	Glycosuria occurs with diabetes mellitus.
Ketones	None	Ketonuria occurs with starvation and diabetic ketoacidosis.
Red blood cells	0-5 cells/high-power field	Red blood cells indicate injury to kidney tissue (see Color, above) or bleeding from any element of the urinary tract. Causes include tumors, benign growth, infection.
White blood cells	0-5 cells/high-power field	White blood cells indicate inflammation.
Casts	0-4 hyaline casts/low-power field	Casts are seen with UTI, renal disease.

Modified from Monahan FD et al: *Phipps' medical-surgical nursing: health and illness perspectives*, ed 8, St Louis, 2007, Mosby.
ADH, Antidiuretic hormone; *UTI*, urinary tract infection.

Kinds of urinary calculi are **renal calculus** and **vesical calculus.** See also **calculus.**

urinary casts [Gk, *ouron,* urine; ONorse, *kasta*], cells or particles excreted in the urine having the shape of renal-collecting tubule cells.



Urinary casts *(Wein et al, 2007)*

urinary catheterization, a nursing intervention from the Nursing Interventions Classification (NIC) defined as insertion of a catheter into the bladder for temporary or permanent drainage of urine. See also **Nursing Interventions Classification.**

urinary catheterization: intermittent, a nursing intervention from the Nursing Interventions Classification (NIC) defined as regular periodic use of a catheter to empty the bladder. See also **Nursing Interventions Classification.**

urinary continence, a nursing outcome from the Nursing Outcomes Classification defined as control of elimination of urine from the bladder. See also **Nursing Outcomes Classification.**

urinary diversion, surgical creation of an alternate route of flow for urine to replace an absent or diseased portion of the lower urinary tract to preserve renal function.

urinary elimination, a nursing outcome from the Nursing Outcomes Classification defined as collection and discharge of urine. See also **Nursing Outcomes Classification.**

urinary elimination management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as maintenance of an optimum urinary elimination pattern. See also **Nursing Interventions Classification.**

urinary flow study. See **uroflowmetry.**

urinary frequency, frequent urination or urgency without an increase in the total daily volume of urine. The condition may result from a bladder or urethral infection, a diminished bladder capacity, or other structural abnormalities. See also **cystitis, cystocele, ureterocele, urethritis, urethrocele.**

urinary habit training, a nursing intervention from the Nursing Interventions Classification (NIC) defined as establishing a predictable pattern of bladder emptying to prevent incontinence for persons with limited cognitive ability who have urge, stress, or functional incontinence. See also **Nursing Interventions Classification.**

urinary hesitancy, a decrease in the force of the stream of urine, often with difficulty in beginning the flow. Hesitancy is usually the result of an obstruction or stricture between the bladder and the external urethral orifice. In men, it may indicate an enlargement of the prostate gland; in women, it may indicate stenosis of the orifice. Cold, stress, dehydration, and various neurogenic and psychogenic factors are common causes of this condition.

urinary incontinence, inability to control urination, caused by acute or chronic factors. Five classes of chronic incontinence are recognized. Functional incontinence is the result of cerebral clouding and/or physical factors that make it difficult to get to bathroom facilities in time. Overflow incontinence occurs when the urinary tract is obstructed or when the detrusor muscle fails to contract as bladder capacity is reached; spinal cord injury or benign prostatic hypertrophy may be the cause. Stress incontinence is precipitated by coughing, sneezing, or straining; it occurs more often in women and is commonly related to anatomic changes. Urge incontinence is the inability to delay voiding after a sensation of bladder fullness is perceived. Reflex incontinence occurs when there is detrusor hyperreflexia and/or urethral relaxation due to neurological causes, such as spinal cord injury. Urinary incontinence can have mixed etiologies. Treatment depends on the underlying cause and may include anticipatory toileting, bladder retraining, exercise of perineal muscles, anticholinergic medications, and surgery. See also **incontinence, retention with overflow.**

urinary incontinence care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance in promoting continence and maintaining perineal skin integrity. See also **Nursing Interventions Classification.**

urinary incontinence care: enuresis, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of urinary continence in children. See also **Nursing Interventions Classification.**

urinary infection. See **urinary tract infection.**

urinary meatus, the external opening of the urethra.

urinary output, the total volume of urine excreted daily, normally between 700 and 2000 mL. The smaller number represents the minimum volume needed to excrete waste products. Various metabolic and renal diseases may increase or decrease urinary output. See also **anuria, oliguria, polyuria.**

urinary overflow, a condition that occurs when a patient's bladder is extremely distended with urine and the patient voids or leaks only a small amount of it. It is usually poorly controlled. See also **retention with overflow.**

urinary retention care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assistance in relieving bladder distension. See also **Nursing Interventions Classification.**

urinary sediment [Gk, *ouron,* urine; L, *sedimentum,* a settling], solid matter that settles to the bottom of a urine sample that has been allowed to stand for several hours.

urinary space, a narrow chalice-shaped cavity in the renal glomerulus between the visceral layer and the parietal layer of the glomerular capsule, continuous with the lumen of the proximal convoluted tubule.

urinary system. See **urinary tract.**

urinary system assessment, an evaluation of the condition and functioning of the kidneys, ureters, bladder, and urethra and an investigation of concurrent and previous disorders that may be factors in abnormalities in these structures. The assessment aids the urologist in diagnosing the abnormalities.

■ METHOD: In an interview the patient is asked whether painful urination, frequency or burning on urination, dribbling, a decreased urinary stream, nocturia, stress incontinence, headache, back pain, or increased thirst has occurred. The color, odor, and amount of urine voided and obtained via catheter are determined. The patient's vital signs; any bladder distension; skin condition; neurological changes; the location, duration, and character of pain; and the presence of bladder spasms are recorded. It is determined whether the patient has hypertension, diabetes, a venereal disease, vaginal or urethral drainage or discharge, or a history that includes cystitis, pyelonephritis, kidney stones, prostatectomy, renal surgery, a kidney transplant, or a venereal infection. The patient's sexual activity; use of coffee, tea, cola beverages, alcohol, perfumed soaps, feminine hygiene sprays, and prescribed and over-the-counter medication; and habit of bathing in a tub or shower are ascertained. A family history of polycystic kidney disease, hypertension, diabetes, or cancer is noted in the assessment, together with laboratory studies of the specific gravity of the patient's urine, casts, protein, red and white blood cells in the urine, and serum creatinine level. Diagnostic procedures may include cystoscopy, ultrasonic imaging, nuclear imaging, urethroscopy, excretory and IV urography, renal angiography, retrograde studies, and x-ray film of the kidneys, ureters, and bladder.

urinary tract, all organs and ducts involved in the secretion and elimination of urine from the body. Also called **urinary system.**

urinary tract infection (UTI), an infection of one or more structures in the urinary system. Most UTIs are caused by gram-negative bacteria, most commonly *Escherichia coli* or species of *Klebsiella, Proteus, Pseudomonas,* or *Enterobacter,* although other strains, such as *Staphylococcus* and *Serratia,* are emerging. The condition is more common in women than in men. UTIs may be asymptomatic but are usually characterized by urinary frequency, burning pain with voiding, and, if the infection is severe, visible blood and pus in the urine. Fever and back pain often accompany kidney infections. Diagnosis of the cause and location of the infection is made by microscopic examination and bacteriological culture of a urine specimen, physical examination of the patient, and, if necessary, various radiological techniques such as retrograde pyelography or cystoscopy. Treatment includes antibacterial, analgesic, and urinary antiseptic drugs and increased fluid intake up to 3L/day unless contraindicated. Teaching the patient about increased fluid intake, frequent voiding, and good perineal hygiene is also helpful. Kinds of urinary tract infections include **cystitis, pyelonephritis,** and **urethritis.** Also called **urinary infection.**

urinary urgency, the sudden, almost uncontrollable, need to urinate.

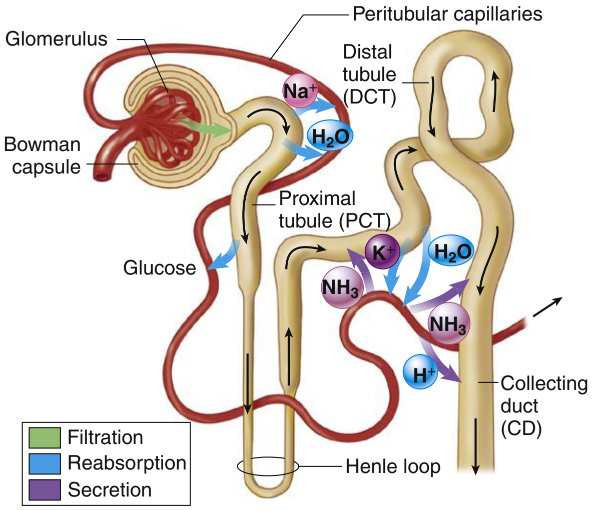
urinate /yŏŏr′ināt/ [Gk *ouron* urine], to excrete urine from the bladder.

urination /yŏŏr′inā′shən/ [Gk, *ouron* + L, *atus,* process], the act of passing urine. Also called **micturition, voiding.**

urine /yŏŏr′in/ [Gk *ouron*], the fluid secreted by the kidneys, transported by the ureters, stored in the bladder, and voided through the urethra. Normal urine is clear, straw-colored, and slightly acid; has the odor of urea; and has a specific gravity between 1.003 and 1.035. Its normal constituents include water, urea, sodium chloride, potassium chloride, phosphates, uric acid, organic salts, and the pigment urobilin. Abnormal constituents indicative of disease include ketone bodies, protein, bacteria, blood, glucose, pus, and certain crystals. See also **bacteriuria, glycosuria, hematuria, ketoaciduria, proteinuria. —urinary,** *adj.*

urine culture and sensitivity (C&S), a microscopic study of the urine culture performed to determine the presence of pathogenic bacteria in patients with suspected urinary tract infection.

urine flow studies, a noninvasive, uncomplicated urodynamic test that measures the volume of urine expelled from the bladder per second. It is indicated to investigate dysfunctional voiding or suspicious outflow tract obstruction and is done before and after any procedure designed to modify the function of the urological outflow tract.



Urine formation *(Patton and Thibodeau, 2010)*

urine glucose test, a qualitative urine test that is usually done as part of a routine urinalysis to screen for the presence of glucose in the urine, which may indicate diabetes mellitus or other causes of glucose intolerance. Other tests are then used to confirm the diagnosis.

urine osmolality, the osmotic pressure of urine, usually greater than the osmolality of serum. The normal values are 500 to 800 mOsm/L after overnight water deprivation. (Term osmolality is often used interchangeably with osmolarity.)

urine osmolality test, a urine test used in the precise evaluation of the concentrating ability of the kidney. It is also used to monitor fluid and electrolyte imbalance and is valuable in the workup of patients with renal disease, the syndrome of inappropriate antidiuretic hormonesecretion, and diabetes insipidus.

urine pH, the hydrogen ion concentration of the urine, or a measure of its acidity or alkalinity. The normal pH value for urine is 4.6 to 8.0.

urine potassium (K^+) test, a 24-hour urine test that detects the urine concentration of potassium, the major cation within cells. Abnormal findings are associated with chronic and acute renal failure, Cushing's syndrome, hyperaldosteronism, alkalosis, diuretic therapy, dehydration, Addison's disease, malnutrition, and malabsorption, among other conditions.

urine protein. See **urinary albumin.**

urine sodium test (Na^+), a 24-hour urine test that evaluates sodium balance in the body by determining the amount of sodium excreted in urine during a 24-hour period. It is useful for evaluating patients with volume depletion, acute renal failure, adrenal disturbances, and acid-base imbalances. It is especially important when the serum sodium concentration is low.

urine specific gravity, a measure of the degree of concentration of a sample of urine. The normal range of urine specific gravity is 1.003 to 1.035, depending on the patient's previous fluid intake, renal perfusion, and renal function.

urinoma /yŏŏr′inō′mə/, *pl.* **urinoma, urinomata,** a cyst filled with urine.

urinometer /yŏŏr′inom′ətər/ [Gk, *ouron* + *metron,* measure], any device for determining the specific gravity of urine. Also called **urometer.** See also **hydrometer.**

Urinometer *(Courtesy of Becton, Dickinson, and Company [BD]).*

Urised, a trademark for a urinary fixed-combination drug containing an antibacterial (methenamine), an analgesic **(phenyl salicylate),** anticholinergics **(atropine sulfate** and hyoscyamine sulfate), an antifungal **(benzoic acid),** and an antiseptic **(methylene blue).**

Urispas, a trademark for a smooth muscle relaxant **(flavoxate hydrochloride).**

uro- /yo͝or′ō-/, prefix meaning "urine, the urinary tract, or urination": *urocrisia, uromancy, uropterin.*

urobilin /yo͝or′əbī′lin/, a brown pigment formed by the oxidation of urobilinogen, normally found in feces and in small amounts in urine.

urobilinogen /yo͝or′əbīlin′əjən/, a colorless compound formed in the intestine after the breakdown of bilirubin by bacteria. Some of this substance is excreted in feces, and some is resorbed and excreted again in bile or urine. See also **urobilin.**

urobilinuria /yo͝or′ōbī′lino͝or′ē·ə/, the presence of excess urobilin in the urine.

urodynamics /-dīnam′iks/ [Gk, *ouron,* urine, *dynamis,* force], the study of the hydrology and mechanics of urinary bladder filling, emptying, and voiding.

uroflowmetry /yo͝or″ōflō′mətrē/, continuous recording of urine flow by means of a device consisting of a cylinder placed on a transducer that weighs the urine entering the cylinder during voiding and plots the flow rate on a time scale. Also called **flow study.**

urofollitropin /u′rofol′itro′pin/, a preparation of gonadotropins from the urine of postmenopausal women. It contains follicle-stimulating hormone and is used in conjunction with human chorionic gonadotropin to induce ovulation in the treatment of female infertility and to stimulate multiple oocyte development in ovulatory patients using assisted reproductive technologies. Administered by subcutaneous injection.

urogenital /yo͝or′ōjen′ital/ [Gk, *ouron* + L, *genitalis,* fruitful], pertaining to the urinary and the reproductive systems. Also called **genitourinary.**

urogenital hiatus, a U-shaped defect in the muscles in the urogenital triangle that allows the passage of the urethra and vagina.

urogenital peritoneum, the peritoneum lining the urogenital structures in the lower pelvis.

urogenital region, the part of the perineal region that surrounds the external genital organs and the urethral orifice.

urogenital sinus, one of the elongated cavities, formed by the division of the cloaca in early embryonic development, into which open the ureter, mesonephric and paramesonephric ducts, and bladder. It also gives rise to the vestibule, urethra, and part of the vagina in the female and part of the urethra in the male.

urogenital system, all of the urinary and genital organs and their associated structures, including the kidneys, ureters, bladder, and urethra; the ovaries, fallopian tubes, uterus, clitoris, and vagina (in women); and the testes, seminal vesicles, seminal ducts, prostate, and penis (in men). Also called **genitourinary system.** See also the **Color Atlas of Human Anatomy,** pp. A39-A41.

urogenital triangle, the triangle in the peritoneum anterior to the imaginary line between the two ischial tuberosities.

urogram /yo͝or′əgram′/, an x-ray film of the urinary tract, obtained by urography. See also **pyelogram.**

urography /yo͞orog′rəfē/ [Gk, *ouron* + *graphein,* to record], the radiographic examination of the urinary system. A radiopaque substance is injected, and radiographs are taken as the substance is passed through or excreted from the part of the system being studied. Some kinds of urography are **cystoscopic urography, intravenous pyelography,** and **retrograde pyelography.**

urokinase /yo͝or′əkī′nās/, an enzyme produced in the kidney and found in urine that is a potent plasminogen activator of the fibrinolytic system. A pharmaceutic preparation of urokinase is administered intravenously in the treatment of pulmonary embolism.

urolagnia /yo͝or′əlag′nē·ə/, sexual stimulation gained from acts involving urine, such as watching people urinate or being urinated on.

urolithiasis /yo͝or′ōlithī′əsis/, the presence of calculi in the urinary system.

urological /-loj′ik/ [Gk, *ouron,* urine, *logos,* science], pertaining to the scientific study of the urinary tract.

urologist /yo͝orol′əjist/, a licensed physician who has completed an approved residency program and who specializes in the practice of urology.

urology /yo͝orol′əjē/ [Gk, *ouron* + *logos,* science], the branch of medicine concerned with the study of the anatomy, physiology, disorders, and care of the urinary tract in men and women and of the male genital tract. **—urological,** *adj.*

uromelus. See **sympus monopus.**

urometer /yo͝orom′ətər/ [Gk, *ouron,* urine, *metron,* measure], a type of hydrometer used to measure the specific gravity of a urine sample. Also called **urinometer.**

urono-. See **uro-.**

uropathy /yo͝orop′əthē/ [Gk, *ouron* + *pathos,* disease], any disease or abnormal condition of any structure of the urinary tract. **—uropathic,** *adj.*

uroporphyria /yo͝or′ōpôrfir′ē·ə/ [Gk, *ouron* + *porphyros,* purple], a rare genetic disease characterized by excessive secretion of uroporphyrin in the urine, blistering dermatitis, photosensitivity, splenomegaly, and hemolytic anemia. Corticosteroid ointments may be helpful for the skin lesions; splenectomy may be necessary to alleviate the hemolytic anemia. Most patients die from hematologic complications before they reach middle age. See also **porphyria.**

uroporphyrin /yo͝or′ōpôr′firin/, a porphyrin normally excreted in the urine in small amounts. See also **uroporphyria.**

uroporphyrinogen-1-synthase test, a blood test used to detect a deficiency of uroporphyrinogen-1-synthase, associated with porphyria.

uroprotective /u′ro-pro-tek′tiv/, providing protection of the urinary tract, especially against urotoxicity.

uroradiology /-rā′dē·ol′əjē/, the radiological study of the urinary tract.

urorectal septum /-rek′təl/ [Gk, *ouron* + L, *rectus,* straight, *saeptum,* wall], a ridge of mesoderm covered with endoderm that in the early developing embryo divides the endodermal cloaca into the urogenital sinus and the rectum. Also called **cloacal septum.**

uroscopy /yo͝oros′kəpē/ [Gk, *ouron,* urine, *skopein,* to view], diagnostic examination of urine samples.

urostomy /yo͝oros′təmē/, the diversion of urine away from a diseased or defective bladder through a surgically created opening, or stoma, in the skin.

urothelium /yo͝or″ōthē′lē·əm/, a layer of transitional epithelium in the wall of the bladder, ureter, and renal pelvis.

urotoxicity /yo͝or′ōtoksis′itē/, the toxic quality of the urine.

Uroxatral, a trademark for **alfuzosin.**

ursodeoxycholic acid /ur′sōdē·ok′sikol′ik/, a secondary bile salt. It is used in vivo to dissolve cholesterol gallstones. See also **chenodeoxycholic acid.**

urticaria /ur′tiker′ē·ə/ [L, *urtica,* nettle], a pruritic skin eruption characterized by transient wheals of varying shapes and sizes with well-defined erythematous margins and pale centers. It is caused by capillary dilation in the dermis that results from the release of vasoactive mediators, including histamine, kinin, and the slow reactive substance of anaphylaxis associated with antigen-antibody reaction. It may be a reaction to drugs, food, insect bites, inhalants, emotional stress, exposure to heat or cold, or exercise. Treatment includes antihistamines and removal of the stimulus or allergen. Also called **hives.** See also **angioedema**, **cholinergic urticaria.** **—urticarial,** *adj.*

urticaria bullosa [L, *urtica,* nettle, *bulla,* bubble], a skin eruption in which the lesions are capped by blisters.

urticaria hemorrhagica. See **hemorrhagic urticaria.**

urticarial, pertaining to hives. See **urticaria.**

urticaria maculosa [L, *urtica,* nettle, *macule,* spot], a chronic skin eruption in which red lesions form with little or no edema present.

urticaria medicamentosa [L, *urtica,* nettle, *medicina*], a form of skin eruption that follows the use of certain medications, including those containing quinine.

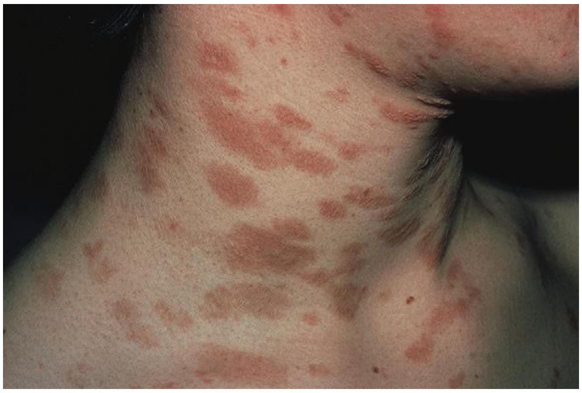
urticaria papulosa [L, *urtica,* nettle, *papula,* pimple], a form of skin eruption affecting mainly children and characterized by reddish macules on which papules develop.

urticaria pigmentosa, an uncommon form of mastocytosis characterized by pigmented skin lesions that usually begin in infancy and become urticarial on mechanical or chemical irritation. Although duration of the condition is unpredictable, prognosis is good. Treatment is symptomatic and usually includes antihistamines for relief of itching. See also **mastocytosis.**

urushiol /əro͞o′shē·ôl/, a toxic resin in the sap of certain plants of the genus *Rhus,* such as poison ivy, poison oak, and poison sumac, that produces allergic contact dermatitis in many people.

-us, suffix usually identifying singular nouns: *echolalus, thalamus, tonus.*

USAN /yo͞o′san, yo͞o′es′ā′en′/, abbreviation for *United States Adopted Names,* an organization that works with pharmaceutic manufacturers to designate names for nonproprietary drugs. A list of USAN-approved drugs is published by U.S. Pharmacopeial Convention, Inc. See also **nonproprietary name.**



Urticaria pigmentosa *(James, Berger, and Elston, 2006)*

use effectiveness [L, *usus,* make use of, *efficere,* to produce], (of a contraceptive method) the actual effectiveness of a medication, device, or method in preventing pregnancy. Inconsistent use and human error usually reduce the theoretic effectiveness of any particular method of contraception. Compare **theoretic effectiveness.**

use factor, (in x-ray shielding design) the fraction of time that an x-ray beam is pointing in any given direction.

useful beam, (in radiology) that part of the primary radiation that is permitted to emerge from the tube head assembly of an x-ray machine, as limited by the aperture or port and accessory collimating devices.

useful radiation, the part of direct radiation that is permitted to pass from an x-ray tube housing through the tube head port, aperture, or collimator. Also called **useful beam.**

user documentation. See **documentation.**

user friendly, presenting operating information or instructions in a form that is familiar and easy to understand.

user interaction. See **interactive terminal.**

use test, a procedure used to identify offending allergens in foods, cosmetics, or fabrics by the systematic elimination and addition, one at a time, of specific items associated with the life-style of the patient involved. Allergic reactions to the use test may be immediate or spread over a considerable period of time. Some patients undergoing the test become frustrated and discouraged, requiring regular encouragement to continue the search for sources of their allergies by this method. See also **allergy testing.**

U-shaped arch, a dental arch in which there is little difference in width between the first premolars and the last molars and in which the curve from canine to canine is abrupt and U-shaped.

Usher's syndrome, an inherited disorder characterized by retinitis pigmentosa and a sensorineural hearing deficit.

USMLE, abbreviation for **United States Medical Licensing Examination®.**

USP, **1.** abbreviation for ***United States Pharmacopeia.*** **2.** abbreviation for **heparin lock flush solution.**

USPHS, abbreviation for **United States Public Health Service.**

USP unit, a dose unit as recommended by the *United States Pharmacopoeia,* the primary legally recognized national drug-standard compendium. Almost all prescription medications are now distributed on a mass basis rather than a unit basis.

USRDS, abbreviation for *United States Renal Data System.*

USR test. See **unheated serum reagin test.**

uta /yo͞o′tə/ [Sp, facial ulcers], a mild cutaneous form of American leishmaniasis occurring in the Andes of Peru and

Argentina, caused by *Leishmania peruana*. The lesions are small and usually occur on the exposed surfaces of the skin, which ordinarily heal spontaneously within 1 year. The disease has been slowly disappearing because of the increased use of insecticides.

ut dict., abbreviation for the Latin phrase *ut dictum,* "as directed."

utend., abbreviation for the Latin phrase *utendus,* "to be used."

uter-, utero-, combining form meaning "relating to the uterus": *uteroplasty, uterotomy.*

uteralgia. See **metralgia.**

uterine /yo͞o′tərēn/ [L, *uterus,* womb], pertaining to the uterus.

uterine anteflexion [L, *uterus,* womb, *ante,* before, *flectere,* to bend], an abnormal position of the uterus in which the uterine body is bent forward on itself at the juncture of the isthmus of the uterine cervix and the lower uterine segment.

uterine anteversion, a position of the uterus in which the body of the uterus is directed ventrally. Mild degrees of anteversion are of no clinical significance. On speculum examination of the vagina, acute anteversion of the uterus may be deduced from the location of the cervix in the posterior of the vaginal vault. Slight anteversion is the most common uterine position. On speculum examination, the cervix is in the middle of the top of the vagina vault and protrudes directly downward toward the vaginal orifice.

uterine appendages, the uterine appendages: the ovaries, fallopian tubes, and associated ligaments. Also called **adnexa uteri.**

uterine bleeding [L, *uterus* + ME, *blod*], any loss of blood from the uterus.

uterine bruit, a sound made by the passage of blood through the arteries of the pregnant uterus. The sounds are synchronized with the maternal heart rate. See also **uterine souffle.**

uterine cancer, any malignancy of the uterus, including the cervix or endometrium. See also **cervical cancer, endometrial cancer.**

uterine colic [L, *uterus* + Gk, *kolikos,* pain in the colon], a spasmodic pain originating in the uterus. It is usually caused by dysmenorrhea or extrusion of a fibroid polyp.

uterine fibroid [L, *uterus* + *fibra,* fiber; Gk, *eidos,* form], a growth of fibrous tissue in the uterus, usually a fibroma, fibromyoma, or leiomyofibroma.

uterine fibroma, a benign encapsulated uterine tumor. It affects about 20% of women over the age of 30. The tumor may develop in the wall of the uterus or be attached to a stalk of tissue originating in the wall. Symptoms may include menstrual disorders such as menorrhagia. Symptoms are also likely to be related to the location of the tumor with respect to neighboring organs, as when a uterine fibroma causes pressure on the urinary bladder, producing symptoms of dysuria. Uterine fibromas rarely spread or become life-threatening.

uterine glands, simple tubular glands found throughout the thickness and extent of the endometrium. They become enlarged during the premenstrual period.

uterine hemorrhage, bleeding from the uterus. Types of uterine hemorrhage include fetomaternal hemorrhage, in which fetal blood cells leak into the maternal circulation; postmenopausal bleeding; and dysfunctional uterine bleeding. See also **hemorrhage, intrapartum hemorrhage, postpartum hemorrhage.**

uterine inertia, abnormal relaxation of the uterus during labor, causing a lack of obstetric progress, or after childbirth, causing uterine hemorrhage.

uterine ischemia, a decreasing or ineffective blood supply to the uterus.

uterine peristalsis, rhythmic movements of the myometrium, seen especially during the follicular phase of the menstrual cycle.

uterine prolapse, the falling, sinking, or sliding of the uterus from its normal location in the body.

uterine retroflexion, a position of the uterus in which its body is bent backward on itself at the isthmus of the cervix and the lower uterine segment. This condition has no clinical significance; it does not prevent conception or adversely affect pregnancy. On speculum examination of the vagina, the condition may be deduced by the location of the cervix in the anterior vaginal vault. The fundus of the uterus may also often be felt through the rectal wall upon rectovaginal examination.

uterine retroversion, a position of the uterus in which the body of the uterus is directed away from the midline, toward the back. Mild degrees of retroversion are common and have no clinical significance. Severe retroversion may be accompanied by vague persistent pelvic discomfort and dyspareunia and may prevent the fitting and use of a contraceptive diaphragm. Compare **uterine anteversion.** See also **uterine retroflexion.**

uterine sinus, one of the small irregular vascular channels in the endometrium of the pregnant uterus.

uterine souffle, a soft, blowing sound made by the blood in the arteries of a pregnant uterus. It is synchronized with the maternal pulse.

uterine sound, a long, flexible sound for measuring uterine depth.

uterine subinvolution [L, *uterus* + *sub,* under, *involere,* to roll up], delayed or absent involution of the uterus during the postpartum period. The causes of subinvolution include retained fragments of placenta, uterine fibromyomas, and infection. Regardless of the cause of the condition, it is characterized by longer and heavier bleeding after childbirth and, on pelvic examination, a larger and softer uterus than would be expected at that time. Treatment includes ergonovine given by mouth for 2 or 3 days, and, if an infection is present, an antibiotic. The hemoglobin or hematocrit is also evaluated, and iron is given if necessary. A follow-up examination is performed 2 weeks later. Also called **partial involution.**

uterine swab [L, *uterus* + D, *zwabber*], an absorbent material on a rod or flattened wire used to obtain specimens or to remove secretions from the uterus.

uterine tenaculum. See **tenaculum.**

uterine tetany, a condition characterized by uterine contractions that are extremely prolonged. This condition may be life threatening to the fetus.

uterine tube. See **fallopian tube.**

uteritis. See **metritis.**

utero-. See **uter-.**

uteroabdominal pregnancy /yo͞o′tərō′abdom′inəl/ [L, *uterus* + *abdomen* + *pregnans*], a twin pregnancy in which one fetus develops in the uterus and the other develops in the abdomen.

uteroglobulin. See **blastokinin.**

utero-ovarian varicocele /yo͞o′tərō′ ōver′ē·ən/ [L, *uterus* + *ovum,* egg, *varix,* varicose vein; Gk, *kele,* tumor], a swelling of the veins of the pampiniform plexus of the female pelvis. Compare **ovarian varicocele.**

uteroplacental apoplexy. See **Couvelaire uterus.**

uteroplacental sinus /yo͞o′tərōpləsen′təl/, one of the spaces in the zone of the placenta and the uterine wall where blood is exchanged between the circulations of the fetus and the mother.

uteroplasty. See **metroplasty.**

uterosacral ligament, a ligament that extends from the cervix to the posterior pelvic wall. It is thought to help stabilize the uterus in the pelvic cavity.

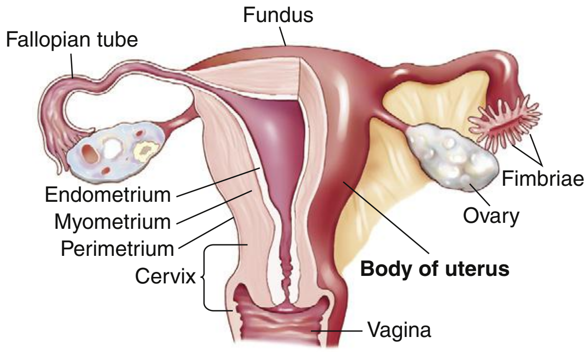
uterosalpingography /yo͞o′tərōsal′ping·gog′rəfē/ [L, *uterus* + Gk, *salpinx,* tube, *graphein,* to record], a radiographic examination of the uterus and fallopian tubes.

uterotomy /yo͞o′tərot′əmē/ [L, *uterus* + Gk, *temnein,* to cut], a surgical incision into the uterus, such as in a cesarean section.

uterovaginal /yo͞o′tərovaj′inəl/, pertaining to the uterus and vagina.

uterovesical. See **vesicouterine.**

uterus /yo͞o′tərəs/ [L, womb], the hollow pear-shaped internal female organ of reproduction in which the fertilized ovum is implanted and the fetus develops and from which the decidua of menses flows. Its anterior surface lies on the superior surface of the bladder, separated by a fold of peritoneum, the vesicouterine pouch. Its posterior surface, also covered with peritoneum, is adjacent to the sigmoid colon and some of the coils of the small intestine. The uterus is composed of three layers: the endometrium, the myometrium, and the parametrium. The *endometrium* lines the uterus and becomes thicker and more vascular in pregnancy and during the second half of the menstrual cycle under the influence of the hormone progesterone. The *myometrium* is the muscular layer of the organ. Its muscle fibers wrap around the uterus obliquely, laterally, and longitudinally. The muscle fibers contract during childbirth to expel the fetus. After childbirth the meshlike network of fibers contracts again, creating a mass of natural ligatures that stops the flow of blood from the large blood vessels supplying the placenta. The *parametrium* is the outermost layer of the uterus. It is composed of serous connective tissue and extends laterally into the broad ligament. In the adult the organ measures about 7.5 cm long and 5 cm wide at its fundus and weighs approximately 40 g. During pregnancy it is able to grow to many times its usual size, almost entirely by cellular hypertrophy.



Uterus *(Shiland, 2010)*

uterus bicornis [L, *uterus* + *bis* + *cornu,* horn], a uterus that is divided into two parts, usually separate at the upper end and joined at the lower end.

uterus masculinus. See **prostatic utricle.**

UTI, abbreviation for **urinary tract infection.**

utilitarianism /yo͞otiliter′ē·əniz′əm/ [L, *utilis,* useful, *isma,* practice], a doctrine of ethics that the purpose of all action should be to bring about the greatest happiness for the greatest number of people and that the value of anything is determined by its utility. The philosophy is often applied in the distribution of health care resources, as in decisions regarding the expenditure of public funds for health services.

utilization review (UR) /yo͞o′tilīzā′shən/ [L, *utilis* + *atus,* process], an assessment of the appropriateness and economy of an admission to a health care facility or a continued hospitalization. The length of the hospital stay also is compared with the average length of stay for similar diagnoses.

utricle /yo͞o′trikəl/ [L, *utriculus,* small bag], **1.** a small sac. **2.** the larger of two membranous pouches in the vestibule of the membranous labyrinth of the inner ear. It is an oblong structure that communicates with the semicircular ducts by five openings and receives utricular filaments of the vestibular branch of the vestibulocochlear nerve. Compare **saccule.**

utriculosaccular duct /yo͞otrik′yəlōsak′yələr/ [L, *utriculus* + *sacculus,* small sack, *ducere,* to lead], a duct connecting the utricle with an endolymphatic duct of the membranous labyrinth.

UV, abbreviation for **ultraviolet.**

uvea /yo͞o′vē·ə/ [L, *uva,* grape], the vascular, pigmented, middle coat of the eye. Also called **tunica vasculosa bulbi, uveal tract. —uveal,** *adj.*

uveal malignant melanoma /yo͞o′vē·əl mə·lig′nənt mel′ə·nō′mə/, the most common type of ocular melanoma, consisting of overgrowth of uveal melanocytes and often preceded by a uveal nevus. See also **ocular melanoma.**

uveal tract, the vascular layer of the eye. See **uvea.**

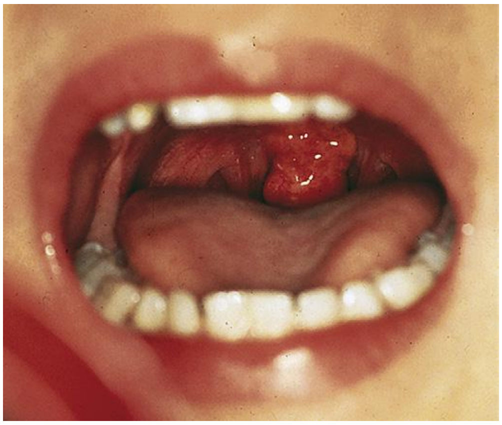
uveitis /yo͞o′vē·ī′tis/ [L, *uva* + Gk, *itis*], inflammation of the uveal tract of the eye, including the iris, ciliary body, and choroid. It may be characterized by an irregularly shaped pupil, inflammation around the cornea, pus in the anterior chamber, opaque deposits on the cornea, pain, and lacrimation. Causes include allergy, infection, trauma, diabetes, collagen disease, and skin diseases. A major complication may be glaucoma. See also **chorioretinitis, choroiditis, iritis.**

uvula /yo͞o′vyələ/ *pl.* **uvulae** [L, *uva,* grape], the small cone-shaped process suspended in the mouth from the middle of the posterior border of the soft palate, especially the uvula palatina. **—uvular,** *adj.*

uvular /yo͞o′vyələr/ [L, *uva,* grape], pertaining to the palatine uvula.

uvulectomy /yo͞o′vyəlek′təmē/ [L, *uva,* grape; Gk, *ektomē,* excision], the surgical removal of the uvula.

uvulitis /yo͞o′vyəlī′tis/, an inflammation of the uvula. Common causes are allergy and infection.



Uvulitis *(Zitelli and Davis, 2007)*

uvulopalatopharyngoplasty. See **palatopharyngoplasty.**

uvulotomy /yo͞o′vyəlot′əmē/, the surgical removal of all or part of the uvula.

U wave, a small, rounded wave that follows the T wave on an electrocardiogram. Normally its polarity is that of the T wave. Its mechanism is unknown. The U wave becomes taller in hypokalemia and inverted in heart disease. It may signify decreased potassium levels in the blood.

V

v, **1.** abbreviation for **vein.** **2.** abbreviation for **venous blood.** **3.** in physics, a symbol for the speed of a wave.

V, **1.** symbol for the element **vanadium.** **2.** symbol for *ventilation capacity of the lung*. **3.** abbreviation for **volt.**

$\dot{V}$, symbol for *rate of gas flow*.

V_{max}, the maximum rate of catalysis.

V_t, abbreviation for **tidal volume.**

VAC, **1.** an anticancer drug combination of vinCRIStine, dactinomycin, and cyclophosphamide. **2.** abbreviation for **Vacuum Assisted Closure.**

vaccinal /vak′si·nəl/ [L, *vaccinus*], **1.** pertaining to vaccinia, to vaccine, or to vaccination. **2.** having protective qualities when used by way of inoculation.

vaccination (vacc) /vak′sinā′shən/ [L, *vaccinus,* relating to a cow], any injection of attenuated or killed microorganisms, such as bacteria, viruses, or rickettsia, administered to induce immunity or to reduce the effects of associated infectious diseases. Historically the first vaccinations were administered to immunize against smallpox. Vaccinations are now available to immunize against many diseases, such as diphtheria, measles, and mumps. —*vaccinate, v.*

vaccine /vaksēn′, vak′sēn, -sin/ [L, *vaccinus*], a suspension of attenuated or killed microorganisms administered intradermally, intramuscularly, orally, or subcutaneously to induce active immunity to infectious disease. Viruses and rickettsia used in some vaccines are grown in avian embryos, rabbit brain tissue, or monkey kidney tissue, and the organisms are usually inactivated by formalin, phenol, or beta-propiolactone. Bacteria for some vaccines may be inactivated by acetone, formalin, heat, or phenol. Vaccines may be used as single agents or in combinations. Compare **antiserum.**

-vaccine, suffix meaning a "preparation containing microorganisms for producing immunity to disease": *autovaccine, enterovaccine, heterovaccine*.

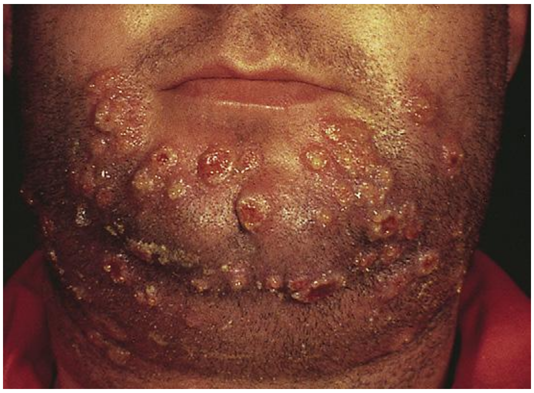
vaccinia /vaksin′ē·ə/ [L, *vaccinus*], an infectious disease of cattle caused by a poxvirus that may be transmitted to humans by direct contact or deliberate inoculation as a vaccine against smallpox. A pustule develops at the site of infection, usually followed by malaise and fever that last for several days. After 2 weeks the pustule becomes a crust that eventually drops off, leaving a scar. Satellite lesions may occur, and the virus may be spread to other sites by scratching. Individuals with eczema or other preexisting skin disease may develop generalized vaccinia. Rarely, a severe encephalitis follows vaccinia. Also called **cowpox.** Compare **smallpox.** See also **vaccination.**

vaccinia immune globulin, a hyperimmune gamma globulin developed for the treatment of skin reactions to immunization against the viral disease vaccinia.

vaccinotherapeutics /vak′sinōther′əpyo͞o′tiks/, a form of therapy that involves injections of bacterial antigens.

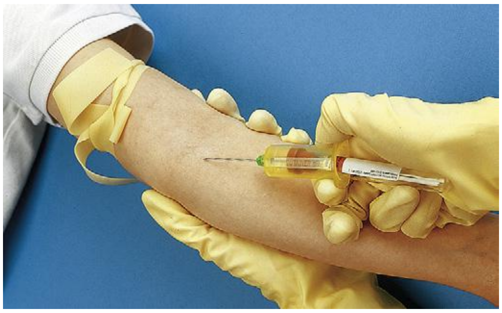
VACTERL association, a nonrandom association of congenital anomalies similar to the VATER association but also including cardiac and limb anomalies; the cause is unknown.

vacuole /vak′yo͞o·ōl/ [L, *vacuus,* empty], **1.** a clear or fluid-filled space or cavity within a cell, such as occurs when a droplet of water is ingested by the cytoplasm. **2.** a small space in the body enclosed by a membrane, usually containing fat, secretions, or cellular debris. —*vacuolar, vacuolated, adj.*



Vaccinia *(du Vivier, 2002)*

Vacutainer® tube, a brand of blood-collection tube with a closure that is evacuated to create a vacuum inside the tube facilitating the draw of a predetermined volume of liquid. It is most commonly used to draw blood samples directly from the vein; it is also used in the collection of urine samples. Vacutainer® tubes may contain additives designed to stabilize and preserve the specimen prior to analytical testing. Vacutainer® is a registered trademark of Becton, Dickinson, and Company.



Obtaining a blood sample with a Vacutainer®
(Sanders et al, 2007)

vacuum aspiration /vak′yo͞o·əm/ [L, *vacuus,* empty, *aspirare,* to breathe upon], a method of removing tissues from the uterus by suction for diagnostic purposes or to remove elements of conception. With the patient under local or light general anesthesia, the cervix is dilated, and the uterus is emptied with suction. Postoperative care includes the close observation of vital signs for symptoms of blood loss. Also called **suction curettage.** Compare **dilation and curettage.** See also **elective abortion, therapeutic abortion.**

Vacuum Assisted Closure (VAC), a trademark for a system that uses the controlled negative pressure of a vacuum to promote healing of certain types of wounds. The edges of the wound are made airtight with foam and a dressing, and a tube is placed in the wound, connecting to a canister that creates a vacuum. Infectious materials and other fluids are then sucked out of the wound.

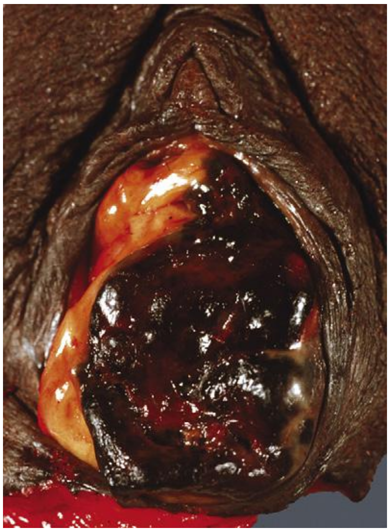
VAD, abbreviation for **vascular access device.**

vade mecum /vā′dē mē′kəm/ [L, go with me], something carried by a person for constant use.

vagal /vā′gəl/ [L, *vagus,* wandering], pertaining to the vagus nerve.

vagal tone [L, *vagus,* wandering; Gk, *tonos,* stretching], **1.** the level of activity in the parasympathetic nervous system. **2.** the inhibitory control of the vagus nerve over heart rate and atrioventricular conduction.

vagina /vəjī′nə/ [L, sheath], the part of the female genitalia that forms a canal from the orifice through the vestibule to the uterine cervix. It is behind the bladder and urethra and in front of the rectum. In the adult woman the anterior wall of the vagina is about 7 cm long, and the posterior wall is about 9 cm long. The canal is actually a potential space; the walls usually touch. The muscles of the vagina are innervated by the pudendal nerve and perfused by the vaginal artery.



Malignant melanoma involving the vagina

(Kumar, Abbas, and Fausto, 2005)

vaginal atrophy /vaj′ənəl/, a postmenopausal condition of gradually declining tissue activity in the female reproductive tract. It is caused by a cessation of follicular inhibin and estrogen secretion. This leads to decreased negative feedback on the release of follicle-stimulating hormone and luteinizing hormone by the anterior pituitary gland. Tissue effects related to estrogen deficiency include atrophy and dystrophy of the vulva and vagina, pruritus vulvae, dyspareunia, cystourethritis, ectropion, and uterovaginal prolapse.

vaginal bleeding, an abnormal condition in which blood is passed from the vagina other than during the menses. It may be caused by abnormalities of the uterus or cervix, an abnormal pregnancy, endocrine abnormalities, abnormalities of one or both ovaries or one or both fallopian tubes, or an abnormality of the vagina. The following terms are commonly used in describing the approximate amount of vaginal bleeding: **heavy vaginal bleeding,** which is greater than heaviest normal menstrual flow; **moderate vaginal bleeding,** which is equal to heaviest normal menstrual flow; **light vaginal bleeding,** which is less than heaviest normal menstrual flow; **vaginal staining,** a very light flow of blood barely requiring the use of a sanitary napkin or tampon; **vaginal spotting,** the passage vaginally of a few drops of blood; and **bloody show,** an episode of light vaginal bleeding as often occurs in early labor, during labor, and, particularly, at the time of full dilation of the cervix at the end of the first stage of labor because of rupture of the cervical capillaries as dilation occurs.

vaginal cancer, a malignancy of the vagina occurring rarely as a primary neoplasm and more often as a secondary lesion or extension of vulvar, cervical, endometrial, or ovarian cancer. Clear cell adenocarcinoma occurs in young women ages 14 to 30 exposed in utero to diethylstilbestrol, given to their mothers to prevent abortion, but most primary vaginal cancers arise in Caucasian women over 50 years of age. A predisposing factor is cervical carcinoma. Vaginal leukoplakia, erythematosus, erosion, or granulation of the mucosa may prove to be carcinoma in situ. Symptoms of invasive lesions are postmenopausal bleeding, purulent discharge, pain, and dysuria. Diagnostic measures include cervical, endocervical, and vaginal Papanicolaou smears, colposcopy, biopsy, and Schiller's iodine test in which malignant cells do not stain dark brown. Ninety percent of vaginal cancers are squamous cell carcinomas; others are clear cell or undifferentiated adenocarcinomas, malignant melanomas, and sarcomas. Depending on the patient's age and condition and the site and extent of the lesion, treatment may be by irradiation or vaginectomy and radical hysterectomy with lymph node dissection. Cryosurgery, topical 5-fluorouracil, and dinitrochlorobenzene may be used, but chemotherapy is not usually effective.

vaginal candidiasis. See **vulvovaginal candidiasis.**

vaginal cornification test, a test for the level of estrogen in a urine sample of a woman. Confirmation is indicated by the appearance of cornified epithelial cells in a vaginal smear of a laboratory animal.

vaginal cyst [L, *vagina,* sheath; Gk, *kytis,* bag], an abnormal closed sac or pouch in the vaginal tissues.

vaginal delivery, birth of a fetus through the vagina.

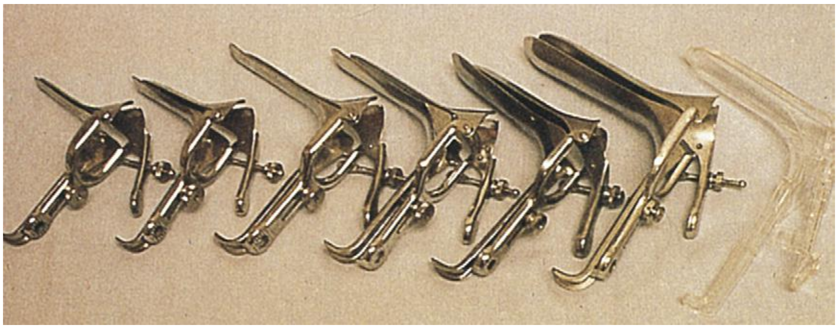
vaginal discharge, any discharge from the vagina. A clear or pearly-white discharge occurs normally. Throughout the reproductive years the amount varies greatly from woman to woman, and the amount and character vary in each woman at different times in her menstrual cycle. Before menarche and after menopause, the quantity of discharge is usually less than during the reproductive years. The discharge is largely composed of secretions of the endocervical glands. Inflammatory conditions of the vagina and cervix often cause an increase in the discharge, which may then have a foul odor and cause pruritus of the perineum and external genitalia.

vaginal fornix, a recess in the upper part of the vagina caused by the protrusion of the uterine cervix into the vagina.

vaginal hernia, **1.** a hernia into the vagina. **2.** a downward protrusion of the cul-de-sac of Douglas between the posterior vaginal wall and the rectum. Also called **posterior vaginal hernia.**

vaginal hysterectomy [L, *vagina,* sheath; Gk, *hystera,* womb, *ektomē,* excision], the surgical removal of the uterus through the vagina.

vaginal instillation of medication, the instillation of a medicated cream, suppository, or gel into the vagina, usually to treat a local infection of the vagina or uterine cervix. The woman voids before the treatment. She then lies back, recumbent or semirecumbent. The nurse or other designated health care provider, wearing gloves, separates the labia majora, exposing the vaginal orifice. The medication is instilled gently. A cream or gel is squeezed into an applicator



Vaginal specula *(Seidel et al, 2006)*

from a tube and is then placed in the vagina by depressing the plunger of the applicator while withdrawing the device from the vagina. A tablet or suppository is usually placed in the vagina near the cervix with another style of applicator that holds the medication in a slotted receptacle at its tip. The woman remains recumbent after the instillation to prevent escape of the medication from the vagina. Most applicators may be washed after each instillation and reused for the same woman for the next dose. They are discarded after a course of treatment.

vaginal jelly, a contraceptive product containing a spermicide in a jelly medium. It is usually used in conjunction with a contraceptive diaphragm or cervical cap. Some antimicrobial medications are also supplied in the form of a vaginal jelly.

vaginal laparotomy, incision into the abdominal cavity through the vagina.

vaginal lubricant, an ointment or cream used to reduce friction in the vagina.

vaginal mucification test /myo͞o′sifikā′shən/, a test for the presence of progestins in a urine sample of a woman. Confirmation is indicated by the stimulation of mucus production in the vaginal epithelium of a laboratory animal.

vaginal speculum [L, *vagina*, sheath; L, *speculum*, mirror], a bivalved instrument, with two blades used to hold open the vaginal opening for inspection of the vaginal cavity.

vaginal spotting, vaginal staining. See **vaginal bleeding.**

vaginal vault, the enlargement of the internal end of the vagina.

vaginismus /vaj′iniz′məs/ [L, *vagina* + *spasmus*, spasm], a psychophysiological genital reaction of women, characterized by intense contraction of the perineal and paravaginal musculature, tightly closing the vaginal introitus. It occurs in response to fear of painful intercourse before coitus or of pelvic examination. Vaginismus is considered abnormal if it occurs in the absence of genital lesions and if it conflicts with a woman's desire to participate in sexual intercourse or to permit examination, but it may be a normal or physiological response if painful genital conditions exist or if forcible or premature intromission is anticipated. Abnormal vaginismus is uncommon. Sexual adjustment often can be achieved through educative and supportive measures that lead to improved sexual self-awareness and response. In some cases the condition is a manifestation of serious mental illness and requires formal psychiatric evaluation and treatment. Gender identity conflict, a history of trauma from rape or incest, or an intense suppression of sexuality in childhood and adolescence are factors that often are associated with vaginismus. See also **dyspareunia.**

vaginitis /vaj′inī′tis/, an inflammation of the vaginal tissues, such as trichomonas vaginitis. See also **atrophic vaginitis.**

vagino-, prefix meaning "vagina": *vaginodynia, vaginolabial, vaginopexy.*

vaginography /vaj′inog′rəfē/, the radiographic examination of the vagina after the injection of a radiopaque contrast medium. The procedure is performed in the investigation of congenital abnormalities, vaginal fistulae, and other pathological conditions.

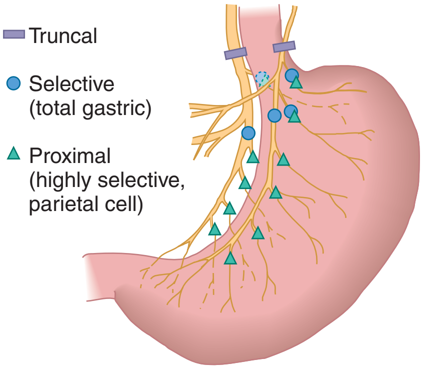
vaginolabial hernia /vaj′inōlā′bē·əl/, an inguinal hernia that reaches the tissue of the labium majus.

vaginoperineoplasty /vaj′inōper′inē′əplas′tē/, plastic surgery of the vagina and perineum.

vagoaccessory syndrome. See **Schmidt's syndrome^1.**

vagosympathetic/vā′gōsim′pəthet′ik/ [L,*vagus*,wandering; Gk, *sympathein,* to feel with], pertaining to the vagus nerve and the cervical part of the sympathetic nervous system.

vagotomy /vāgot′əmē/ [L, *vagus,* wandering, *temnein,* to cut], the cutting of certain branches of the vagus nerve, performed with gastric surgery, to reduce the amount of gastric acid secreted and lessen the chance of recurrence of a gastric ulcer. With the patient under general anesthesia, a gastrectomy is performed, and the appropriate branches of the vagus nerve are excised. Because peristalsis will be diminished, a pyloroplasty or an anastomosis of the stomach to the jejunum may be done to ensure proper emptying of the stomach. See also **anastomosis, gastrectomy, peptic ulcer, pyloroplasty, vagus nerve.**



▬ Truncal
● Selective (total gastric)
▲ Proximal (highly selective, parietal cell)

Vagotomy sites
(Black and Hawks, 2009)

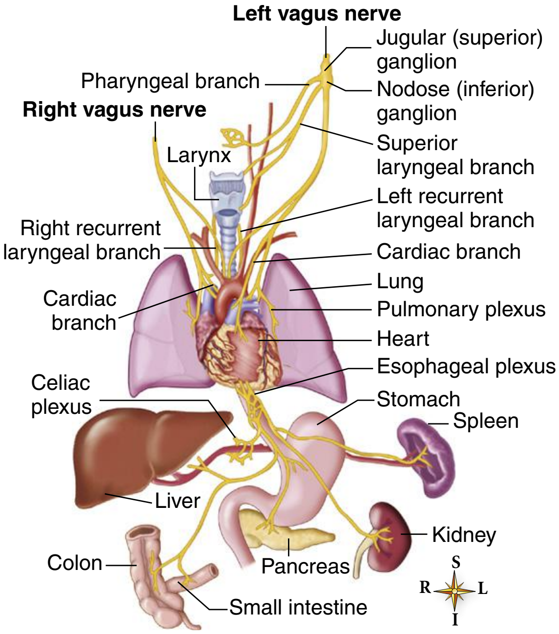
vagotonia. See **sympathetic imbalance.**

vagotonus /vā′gətō′nəs/ [L, *vagus* + Gk, *tonos,* tension], an abnormal increase in parasympathetic activity caused by stimulation of the vagus nerve, especially bradycardia with decreased cardiac output, faintness, and syncope. Vagotonus may occur in suctioning the oropharynx of a newborn as the syringe, laryngoscope blade, or catheter is inadvertently pressed on the back of the throat, stimulating the nerve. It also occurs in some women after surgical treatment or simple manipulation of the uterine cervix.

vagovagal reflex /vā′gōvā′gəl/ [L, *vagus* + *vagus* + *reflectere,* to bend back], a stimulation of the vagus nerve by reflex in which irritation of the larynx or the trachea results in slowing of the pulse rate.

vagueness /vāg′nəs/, a communication pattern involving the use of global pronouns and loose associations that lead to ambiguity and confusion in communication.

vagus nerve /vā′gəs/ [L, *vagus,* wandering, *nervus,* nerve], either of the longest pair of cranial nerves mainly responsible for parasympathetic control over the heart and many other internal organs, including thoracic and abdominal viscera. The vagus nerves communicate through 13 main branches, connecting to four areas in the brain. Also called **nervus vagus, pneumogastric nerve, tenth cranial nerve.**



Vagus nerve *(Patton and Thibodeau, 2010)*

vagus pulse [L, *vagus,* wandering, *pulsare,* to beat], a slow, regular pulse caused by overactivity of the vagus nerve.

Val, abbreviation for **valine.**

valacyclovir /val′a-si′klo-vir/, an ester of acyclovir, to which it is metabolized. The hydrochloride salt is used as an antiviral agent in treatment of genital herpes and herpes zoster in patients who are not immunocompromised. It is administered orally.

valdecoxib, a nonsteroidal antiinflammatory used to treat acute and chronic rheumatoid arthritis, osteoarthritis, and primary dysmenorrhea.

valecular, shallowly grooved. See **vallecula.**

valence /vāl′əns/ [L, *valere,* to be strong], **1.** (in chemistry) a numeric expression of the capability of an element to combine chemically with atoms of hydrogen or their equivalent. An element is considered monovalent (or univalent) if each of its atoms can react with only one hydrogen atom or its equivalent, divalent (or bivalent) if each atom can react with two hydrogen or equivalent atoms, trivalent (or tervalent) if each atom can react with three hydrogen atoms, and polyvalent (or multivalent) if each atom can react with many hydrogen atoms. **2.** (in immunology) an expression of the number of antigen-binding sites for one molecule of any given antibody or the number of antibody-binding sites for any given antigen. Most antibody molecules, and those belonging to the IgG, IgA, and IgE immunoglobulin classes, have two antigen-binding sites. Most large antigen molecules are multivalent.

-valence, -valency, a combining term meaning the "combining capacity of an atom compared with that of one hydrogen atom": *quantivalence, trivalence, univalence.*

valence electron, any of the electrons in the highest principal energy level of an atom or ion. They are responsible for the bonding of atoms to form crystals, molecules, and compounds.

valency. See **valence.**

-valent, suffix meaning "having a valency of a (specified) magnitude": *octavalent, pentavalent, tetravalent.*

valerian, a perennial herb native to Eurasia that is now grown worldwide.

■ USES: This herb is used as a sedative, and is generally considered safe and effective for short-term use.

■ CONTRAINDICATIONS: Valerian should not be used during pregnancy and lactation, in those with known hypersensitivity to this herb, or those with hepatic disease. It should be used only with caution in children, since research is lacking.

valeric acid $(CH_3(CH_2)_3COOH)$ /vəler′ik/, an organic acid with a foul odor found in the roots of *Valeriana officinalis.* Commercially prepared, it is used in the production of perfumes, flavors, lubricants, and certain drugs. Also known as **pantothenic acid.**

valganciclovir /val′gan-si′klo-vir/, a prodrug of ganciclovir, used in treatment of cytomegalovirus infections in immunocompromised patients and administered orally as the hydrochloride salt.

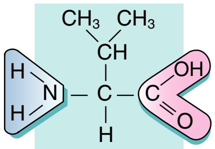
valgus /val′gəs/ [L, bent], describing an abnormal position in which a part of a limb is bent or twisted outward, away from the midline, such as the heel of the foot in **talipes valgus (splayfoot).** Compare **varus.** See also **hallux valgus.**

validation /val′idā′shən/, the reciprocated communication of respect that conveys that the patient's opinions are acknowledged, respected, and heard regardless of whether or not the listener actually agrees with the content.

validation therapy, a nursing intervention from the Nursing Interventions Classification (NIC) defined as use of a method of therapeutic communication with elderly persons with dementia that focuses on emotional rather than factual content. See also **Nursing Interventions Classification.**

validity /valid′itē/, (in research) the extent to which a test measurement or other device measures what it is intended to measure. A data collection tool should accurately reflect the concept that it is intended to measure. Kinds of validity include **construct validity, content validity, current validity,** and **predictive validity.** Compare **reliability.**

valine (Val) /val′ēn/, an essential amino acid needed for optimal growth in infants and for nitrogen equilibrium in adults. Also called **alpha-aminoisovaleric acid.** See also **amino acid, maple syrup urine disease, protein.**



Chemical structure of valine

valinemia. See **hypervalinemia.**

Valisone, a trademark for a glucocorticoid (betamethasone valerate).

Valium, a trademark for a benzodiazepine **(diazepam).**

vallecula /vəlek′yələ/ [L, little valley], **1.** any crevice or depression on the surface of an organ or structure. **2.** See **vallecula epiglottica. —***vallecular, adj.*

vallecula epiglottica, a furrow between the glossoepiglottic folds of each side of the posterior oropharynx. Also called *(informal)* **vallecula.**

vallecular dysphagia /vəlek′yələr/, difficulty or pain on swallowing caused by inflammation of the vallecula epiglottica. Compare **contractile ring dysphagia, dysphagia lusoria.**

valley fever. See **coccidioidomycosis.**

valproate /val-pro′āt/, a salt of valproic acid with anticonvulsant activity similar to that of the acid.

valproic acid /valprō′ik/, an anticonvulsant.

■ INDICATIONS: It is prescribed alone or in combination to treat complex partial seizures, absence seizures occurring alone or in combination with other types of seizures, mania associated with bipolar disorder, and migraine prophylaxis.

■ CONTRAINDICATIONS: It is not recommended for use during pregnancy or lactation. Hepatic disease or dysfunction, urea cycle disorders, and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Among the more severe adverse effects are decreased platelet function and hepatotoxicity, and pancreatitis. GI disturbances are common. Alopecia, rash, headache, and insomnia also may occur. A sometimes fatal hyperammonemic encephalopathy has occurred in patients with known or suspected urea cycle disorders.

valrubicin, an antibiotic antineoplastic.

■ INDICATION: This drug is used to treat bladder cancer.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug include known hypersensitivity to anthracyclines or Cremophor EL, urinary tract infection, and small bladder size.

■ ADVERSE EFFECTS: Life-threatening side effects of this drug include thrombocytopenia and leukopenia. Common side effects include anemia, nausea, vomiting, anorexia, diarrhea, urinary tract infection, urinary retention, hematuria, rash, and chest pain.

Valsalva leak point pressure, the amount of pressure on the bladder by a Valsalva maneuver at which leakage of urine from the urethra occurs. This is a measure of strength of the urethral sphincters.

Valsalva maneuver /valsal′və/ [Antonio M. Valsalva, Italian surgeon, 1666–1723; OFr, *maneuvre,* work done by hand], any forced expiratory effort against a closed airway, such as when an individual holds the breath and tightens the muscles in a concerted, strenuous effort to move a heavy object. Most healthy individuals perform Valsalva maneuvers during normal daily activities without any injurious consequences. However, such efforts are dangerous for many patients with cardiovascular disease, especially if they become dehydrated, increasing the viscosity of their blood and the attendant risk of blood clotting. Constipation increases the risk of cardiovascular trauma in such patients, especially if they perform a Valsalva maneuver in trying to move their bowels. On relaxation after each muscular effort with held breath, the blood of such individuals rushes to the heart, often overloading the cardiac system and causing cardiac arrest. Orthopedic patients often use a Valsalva maneuver in changing their position in bed with the aid of an overhead trapeze bar. Patients who may be endangered by performing a Valsalva maneuver are commonly instructed to exhale instead of holding their breath when they move. Exhalation decreases the risk of cardiovascular trauma. Part of danger is bradycardia response.

Valsalva's test [Antonio M. Valsalva; L, *testum,* crucible], a method for testing the patency of the eustachian tubes. With mouth and nose kept tightly closed, the patient makes a forced expiratory effort. If the eustachian tubes are open, air will enter into the middle ear cavities, and the subject will hear a popping sound. See also **Valsalva maneuver.**

valsartan, an antihypertensive.

■ INDICATIONS: It is used to treat hypertension, either alone or in combination with other agents.

■ CONTRAINDICATIONS: Factors that prohibit its use are known hypersensitivity to valsartan, pregnancy, severe hepatic disease, and bilateral renal artery stenosis.

■ ADVERSE EFFECTS: Life-threatening effects are cerebrovascular accident, myocardial infarction, hepatotoxicity, and nephrotoxicity. Other adverse effects are depression, drowsiness, vertigo, angina pectoris, second-degree atrioventricular block, hypotension, conjunctivitis, abdominal pain, nausea, impotence, neutropenia, cramps, myalgia, musculoskeletal pain, and stiffness. Common side effects are dizziness, insomnia, arrhythmias, diarrhea, anemia, and cough.

value /val′yo͞o/ [L, *valere,* to be strong], a personal belief about the worth of a given idea or behavior.

values clarification^1, a method whereby a person can discover his or her own values by assessing, exploring, and determining what those personal values are and how they affect personal decision making.

values clarification^2, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting another to clarify her/his own values in order to facilitate effective decision making. See also **Nursing Interventions Classification.**

value system, the accepted mode of conduct and the set of norms, goals, and values binding any social group. Such guidelines for determining what is right or wrong, good or bad, and desirable or undesirable serve as a frame of reference for the individual in reaching decisions and in achieving a meaningful life.

valve /valv/ [L, *valva,* folding door], a natural structure or artificial device in a passage or vessel that prevents reflux of the fluid contents passing through it. Valves in veins are membranous folds that prevent backflow of blood. **—valvular,** *adj.*

-valve, suffix meaning "a thing that regulates the flow of": *bivalve, pseudovalve, trivalve.*

valve of Kerkring. See **circular fold.**

valve of lymphatics, any one of the tiny semilunar structures in the vessels and trunks of the lymphatic system that helps regulate the flow of lymph and prevents venous blood from entering the system. There are no valves in the capillaries of the system, but there are many in the collecting vessels. The valves are attached by their convex edges to the walls of the vessels, leaving their concave edges free and directed along the course of the current of lymph. Usually two valves of equal size are found opposite each other. They are more numerous near the lymph nodes and more prevalent in the lymphatic vessels of the neck and the arms than in the vessels of the legs. The wall of the vessel just above the attachment of each valve bulges with a small sinus that gives the vessel its beaded appearance. See also **lymphatic system.**

valve of vein. See **venous valves.**

valvotomy /valvot′əmē/ [L, *valva* + Gk, *temnein,* to cut], the incision into a valve, especially one in the heart, to correct a defect and allow proper opening and closure. Before surgery a cardiac catheterization is performed. With the patient under general anesthesia, the damaged valve is repaired, if possible, or removed. A prosthetic or biological valve suture is put in its place. Complications peculiar to prosthetic valve surgery are displacement of the valve caused by broken sutures, heart block, leakage and regurgitation from chamber to chamber, infection, and embolus.

valvula, certain small valves in the body and cusps of the heart valves. Also called **valvule.**

valvular, pertaining to a structure that controls the flow of a substance. See **valve.**

valvular endocarditis. See **chronic endocarditis.**

valvular heart disease [L, *valva* + AS, *hoert* + L, *dis*, opposite of; Fr, *aise*, ease], an acquired or congenital disorder of a cardiac valve. It is characterized by stenosis and obstructed blood flow and by valvular degeneration and regurgitation of blood. Diseases of aortic and mitral valves are most common and may be caused by congenital defects, bacterial endocarditis, syphilis, or, most frequently, rheumatic fever. Episodes of rheumatic fever cause the cardiac valves to degenerate and remain open or cause the cusps of the valves to become stiff, calcified, constricted, and fused. Valvular dysfunction results in changes in intracardiac pressure and pulmonary and peripheral circulation. It may lead to cardiac arrhythmia, heart failure, and cardiogenic shock. Cardiotonics, diuretics, analgesics, sodium restriction, and antibiotics, if indicated, are used in the conservative treatment of valvular heart disease. Surgery is usually performed when the symptoms are incapacitating. A diseased valve may be repaired by removing the calcium deposits and opening the fused commissures or by removing a cusp and reconstructing the valve, or it may be replaced with a porcine or artificial valve. Kinds of valvular heart disease include **aortic regurgitation, aortic stenosis, mitral regurgitation, mitral valve stenosis, pulmonary stenosis, tricuspid stenosis.**

valvular regurgitation [L, *valva*, folding door, *re* + *gurgitare*, to flow], a backflow of blood that occurs when the heart contracts but a heart valve fails to close properly.

valvular stenosis, a narrowing or stricture of any of the heart valves. The condition may result from a congenital defect or may be caused by disease. See also **aortic stenosis, congenital cardiac anomaly, mitral valve stenosis, pulmonary stenosis.**

valvule. See **valvula.**

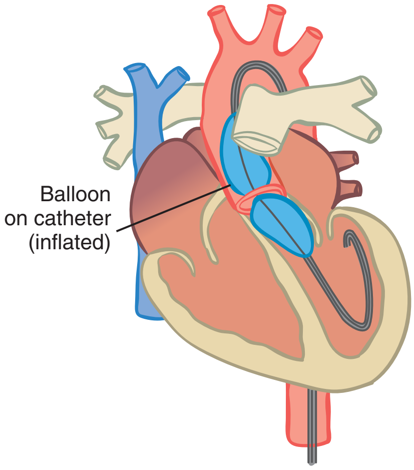
valvulitis /val′vyəlī′tis/, an inflammation of a valve, especially a cardiac valve. Inflammatory changes in the aortic, mitral, and tricuspid valves of the heart are caused most commonly by rheumatic fever and less frequently by bacterial endocarditis and syphilis. Infected valves degenerate, or their cusps become stiff and calcified, resulting in stenosis and obstructed blood flow.

valvuloplasty /val′vyəlōplas′tē/ [L, *valva*, folding door; Gk, *plassein*, to shape], the use of a balloon-tipped catheter to dilate a cardiac valve.

VAMP /vamp/, abbreviation for a combination drug regimen, used in the treatment of cancer, containing three antineoplastics (vinCRIStine sulfate, methotrexate, and mercaptopurine) and a glucocorticoid (predniSONE).

vanadium (V) /vənā′dē·əm/ [ONorse, *Vanadis*, Freya, goddess of fertility], a grayish metallic element. Its atomic number is 23; its atomic mass is 50.942. Absorption of vanadium compounds results in a condition called *vanadiumism*, characterized by anemia, conjunctivitis, pneumonitis, and irritation of the respiratory tract.

van Bogaert's disease /van bō′gərts/ [Ludo van Bogaert, Belgian neurophysiologist, b. 1897], a rare familial disorder of lipid metabolism in which the substance cholestanol is deposited in the nervous system, blood, and connective tissue. Individuals with the disease develop progressive ataxia and dementia, premature atherosclerosis, cataracts, and xanthomas of the tendons. No effective treatment has been found. Also called **cerebrotendinous xanthomatosis.**



Valvuloplasty *(Black and Hawks, 2009)*

Van Buchem's syndrome. See **endosteal hyperostosis.**

Vanceril, a trademark for a glucocorticoid **(beclomethasone dipropionate).**

Vancocin Hydrochloride, a trademark for an antibacterial (vancomycin hydrochloride).

vancomycin /van′kōmī′sin/, an antibiotic.

■ INDICATIONS: It is prescribed in the treatment of infections, particularly staphylococcal infections resistant to other antibiotics and antibiotic-associated pseudomembranous colitis caused by *Clostridium difficile*.

■ CONTRAINDICATIONS: Concomitant administration of neurotoxic, nephrotoxic, or ototoxic drugs or known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are anaphylaxis, dizziness, and tinnitus.

Van Deemter's equation /van dēm′tərz/, an expression of a gas chromatography relationship between the height equivalent to the theoretic plate and the linear velocity of the carrier gas.

Van de Graaff generator /van′ də gräf′/ [Robert J. Van de Graaff, American physicist, 1901–1967], a device in which electrically charged particles are sprayed on a moving belt and carried by it to an insulated terminal, where they cause a large electrostatic charge to build up. The charged particles are then accelerated along a discharge path through a vacuum tube by the potential difference between the insulated terminal and the opposite end of the device. The generator often is used to inject charged particles into a larger accelerator.

van den Bergh's test /van′ dən burgs′/ [Albert A.H. van den Bergh, Dutch physician, 1869–1943], a test for the presence of bilirubin in the blood serum. Blood is obtained from a patient, and the diluted serum is added to diazo reagent. A blue or violet color indicates the presence of bilirubin. The rate and magnitude of the color change are noted. See also **bilirubin.**

van der Waals forces /van′ der wäls′, fän-/ [Johannes D. van der Waals, Dutch physicist and Nobel laureate, 1837–1923], weak attractive forces between neutral atoms and molecules. They occur because a fluctuating dipole moment in one molecule induces a dipole moment in another and the two dipole moments interact in an attractive manner. The activity accounts for some deviation from Boyle's law at very low temperatures or very high pressures. Also called **dispersion forces.**

van der Woude's syndrome /van·der·wō′dəz/, an autosomal-dominant syndrome consisting of cleft lip with or without cleft palate, with cysts of the lower lip.

vanillylmandelic acid (VMA) /vənil′ilməndel′ik/, a urinary metabolite of epinephrine and norepinephrine. It may be measured in the urine to determine the levels of these catecholamines. A greater than normal amount of VMA is characteristic of a pheochromocytoma or neuroblastoma. Increased concentrations of this acid may raise the blood pressure and indicate the presence of tumors of the adrenal glands or nervous system, muscular dystrophy, and myasthenia gravis; they may be caused by stress, exercise, or certain drugs or foods. Normal amounts in the urine of adults after 24-hour collection are 1.5 to 7.5 mg; in the urine of infants, it is 83 mg/kg of body weight. Also called **3-methoxy-4-hydroxymandelic acid.**

vanillylmandelic acid and catecholamines test, a 24-hour urine test that is performed primarily to diagnose hypertension secondary to pheochromocytoma. It is also used to detect the presence of neuroblastomas and rare adrenal tumors.

vanishing testis, a testis that was originally present in the fetus but atrophied in utero because of torsion.

vanishing twin /van′ishing/, a twin embryo or fetus that is aborted during pregnancy.

vanity surgery /van′itē/, plastic surgery performed primarily to make the patient appear more youthful.

Vanoxide, a trademark for a topical fixed-combination drug containing an antibacterial keratolytic **(benzoyl peroxide)** and an antiiflammatory corticosteroid **(hydrocortisone).**

Van Rensselaer, Euphenia /van ren′səlir/, (1840–1912), an American socialite who entered the first class of the Bellevue Hospital Training School for Nurses in New York. She designed the first nurses' uniform, a blue and white seersucker dress with collar and cuffs, apron, and cap. She succeeded Sister Helen as superintendent of Bellevue and later joined the Sisters of Charity, for whom she established a mission in Nassau, N.Y. She organized the Seton Hospital for Tuberculosis in New York.

Vaponefrin, a trademark for an adrenergic agent (epINEPHrine hydrochloride).

vapor /vā′pər/ *pl. vapores, vapors* [L], **1.** an atmospheric dispersion of the gaseous form of a substance that in its normal state is a liquid or solid. **2.** steam, gas, or an exhalation.

vapor bath /vā′pər/, the exposure of the body to vapor, such as steam.

vaporization /vā′pərīzā′shən/ [L, *vapor,* steam], the changing of a liquid or solid (such as dry ice) to a gaseous state.

vaporizer, **1.** a device for reducing medicated liquids to a vapor useful for inhalation or application to accessible mucous membranes. **2.** a device for converting potent liquid anesthetic agents to a vapor useful for inhalation.

vapor pressure depression, a phenomenon in which the addition of a solute molecule to a solvent will decrease the vapor pressure of the solvent in equilibrium with the liquid phase.

vapor therapy, the therapeutic use of vapors or sprays. See also **vaporizer.**

Vaprisol, a trademark for **conivaptan.**

Vaquez's disease. See **polycythemia rubra vera.**

vardenafil, an impotence agent.

■ INDICATION: This drug is used to treat erectile dysfunction.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use. Alpha-blockers or nitrates prohibit should not be coadministered with this drug.

■ ADVERSE EFFECTS: Adverse effects of this drug include hypertension, conjunctivitis, tinnitus, photophobia, diminished vision, glaucoma, abnormal ejaculation, priapism, myalgia, arthralgia, neck pain, rhinitis, sinusitis, dyspnea, pharyngitis, epistaxis, rash, gastroesophageal reflux disease, and increased gamma glutamyl transpeptidase. Life-threatening side effects include myocardial infarction and cardiovascular collapse. Common side effects include headache, flushing dizziness, and insomnia.

varenicline, a smoking cessation agent.

■ INDICATION: This drug is used as a smoking deterrent.

■ CONTRAINDICATIONS: Eating disorders and known hypersensitivity to this drug prohibit its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, agitation, dizziness, insomnia, abnormal dreams, fatigue, malaise, arrhythmias, hypertension, palpitations, tachycardia, angina, hypotension, tinnitus, anorexia, increased or decreased appetite, flatulence, gastroesophageal reflux disease, erectile dysfunction, urinary frequency, menstrual irregularities, rash, pruritus, weight loss or gain, dyspnea, and rhinorrhea. A life-threatening side effect is myocardial infarction. Common side effects include blurred vision, nausea, vomiting, dry mouth, and constipation.

variability /ver′ē·əbil′itē/ [L, *variare,* to diversify], the degree of divergence or ability of an object to vary from a given standard or average.

variable /ver′ē·əbəl/, **1.** a factor in an experiment or scientific test that tends to vary, or take on different values, while other elements or conditions remain constant. See also **categoric variable, dependent variable, independent variable. 2.** an attribute of a person that is measurable and that varies (heart rate, age).

variable behavior [L, *variare,* to diversify; AS, *bihabban,* to behave], a response, activity, or action that may be modified by individual experience. Compare **invariable behavior.**

variable interval (VI) reinforcement, reinforcement that is offered after varying lapses of time.

variable number of tandem repeats (VNTR), different numbers of tandemly repeated oligonucleotide sequences in the alleles of a gene.

variable-performance oxygen delivery system. See **low-flow oxygen delivery system.**

variable ratio (VR) reinforcement, reinforcement that requires variable numbers of responses.

variable region, the part of an immunoglobulin in which the amino acid sequence can differ among molecules of that class of immunoglobulin. The variable region includes the antigen-binding site. Compare **constant region.**

variance /ver′ē·əns/ [L, *variare*], **1.** (in statistics) a numeric representation of the dispersion of data around the mean in a given sample. It is represented by the square of the standard deviation and is used principally in performing an analysis of variance. **2.** nontechnical. the general range of a group of findings.

variant /ver′ē·ənt/ [L, *variare,* to diversify], an individual or subpopulation that differs from other individuals or subpopulations of its species.

variant angina. See **Prinzmetal's angina.**

varicella. See **chickenpox.**

varicella gangrenosa /ver′isel′ə/, a potentially fatal form of varicella characterized by gangrenous lesions. A fulminating subvariety of the skin disorder may become fatal within a few hours if complicated by hemolytic streptococcus.

varicella virus vaccine live, a preparation of live, attenuated human herpesvirus 3 (varicella-zoster virus) administered subcutaneously for production of immunity to varicella and herpes zoster.

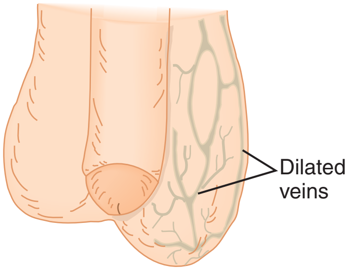
varicella-zoster immune globulin (VZIG) /zos′tər/ [L, *varius,* diverse; Gk, *zoster,* girdle; L, *immunis,* free from, *globulus,* small globe], an immune globulin obtained from the blood of uninfected individuals who have high levels of antibodies against varicella zoster virus. The immune globulin can be administered to people exposed to chickenpox to prevent or modify symptoms of the infection. See also **immunoglobulin.**

varicella zoster virus (VZV) [L, *varius,* diverse; Gk, *zoster,* girdle; L, *virus,* poison], a member of the herpesvirus family, which causes the diseases varicella (chickenpox) with primary infection and herpes zoster (shingles) of the virus reactivator. The virus has been isolated from vesicle fluid in chickenpox, is highly contagious, and may be spread by direct contact or droplets. Dried crusts of skin lesions do not contain active virus particles. Herpes zoster is produced by reactivation of latent varicella virus, usually several years after the initial infection. There is no simple test for measuring antibodies to this virus. However, zoster immune globulin (ZIG) obtained from convalescing zoster patients, if injected within 3 days of exposure, will prevent varicella in susceptible children. The temporary nature of this protection and the relative scarcity of ZIG warrant reservation of its use to children receiving immunosuppressive therapy or suffering from immune deficiency diseases. Herpes zoster should be treated promptly with acyclovir, desciclovir, valaciclovir, or penciclovir to speed healing. (Famciclovir is used for postherpetic neuralgia.) A licensed vaccine is available and highly effective. See also **chickenpox, herpes zoster.**

varicelliform /ver′isel′ifôrm/, resembling the rash of chickenpox.

varices. See **varix.**

varicocele /ver′əkōsēl′/ [L, *varix,* varicose vein; Gk, *kele,* tumor], a dilation of the pampiniform venous complex of the spermatic cord. The varicocele forms a soft, elastic swelling that can cause pain. It is usually more pronounced and painful when the patient is standing. Varicoceles are most common in men between 15 and 25 years of age and affect the left spermatic cord more often than the right. Compare **ovarian varicocele.**



Varicocele *(Black and Hawks, 2009)*

varicose /ver′əkōs/ [L, *varix*], abnormally swollen or dilated.

varicose aneurysm, a blood-filled, saclike projection that connects an artery and one or several veins and that is formed from a localized dilation of the adjoining vessels.

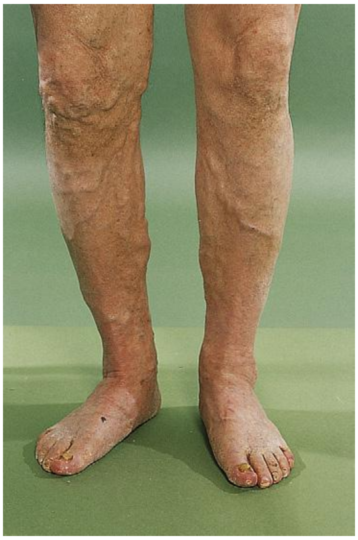
varicose ulcer. See **stasis ulcer.**

varicose vein, a tortuous, dilated vein with incompetent valves. Causes include congenitally defective valves, thrombophlebitis, pregnancy, and obesity. Varicose veins are common, especially in women, and are usually painless. The saphenous veins of the legs are most often affected. Elevation of the legs and use of elastic stockings are frequently sufficient therapy for uncomplicated cases. Ligation of the vein above the varicosity and removal of the distal part of the vessel may be indicated for more severe cases if deeper vessels can maintain the return of venous blood. Injection of sclerosing solutions helps prevent or treat postphlebitic syndrome.

■ OBSERVATIONS: Initially the vein may be palpated but invisible, and the individual may have a feeling of heaviness in the legs that gets worse at night and in hot weather. A dull aching, burning, and cramping also occur after prolonged standing or walking, during menses, when fatigued, and at night. Over time the veins can be seen as dilated, purplish, and ropelike. Venous insufficiency and venous stasis ulcers are the two most common complications. Initial diagnosis is made by inspection and palpation and is checked by a manual compression test that reveals a palpable impulse. A Trendelenburg's test can help pinpoint the location of incompetent valves. Plethysmography and duplex ultrasound scans can be used to detect venous backflow.

■ INTERVENTIONS: Conservative treatment involves elevation and rest of affected extremity, application of lightweight compression hosiery, and avoidance of prolonged standing. Sclerotherapy may be used for removal of unsightly superficial varicosities. Stripping and ligation may be indicated for chronic venous insufficiency, recurrent thrombophlebitis, and persistent varicosities that are painful or ulcerated and are not responsive to conservative treatment.

■ NURSING CONSIDERATIONS: Long-term management of varicosities is directed at improving circulation and preventing stasis, relieving discomfort, and preventing complications. Instruction is given to avoid prolonged standing and sitting and to make frequent position changes. Restrictive and/or occlusive clothing should be avoided, and lower extremities should be periodically elevated above the heart. Compression stockings should be applied while lying down and before rising in the morning. A regular exercise aerobic program should be instituted to promote circulation, and weight reduction is advocated if obesity is a problem.



Varicose veins *(Forbes and Jackson, 2003)*

varicosis /ver′ikō′sis/ [L, *varix* + Gk, *osis,* condition], a common condition characterized by one or more tortuous, abnormally dilated vessels, usually in the legs or the lower trunk. It most often occurs in persons between 30 and 60 years of age. Varicosis may be caused by congenital defects of the valves or walls of the veins or by congestion and increased intraluminal pressure resulting from prolonged standing, poor posture, pregnancy, abdominal tumor, or chronic systemic disease. Symptoms include pain and muscle cramps with a feeling of fullness and heaviness in the legs. Dilation of superficial veins is often evident before the condition produces discomfort.

varicosity /ver′ikos′itē/, **1.** an abnormal condition, usually of a vein, characterized by swelling and tortuosity. **2.** a vein in this condition.

variegate /ver′ē·əgāt′/ [L, *varius,* diverse], having characteristics that vary, especially as to color.

variegate porphyria (VP), an uncommon form of hepatic porphyria, characterized by skin lesions and photosensitivity. The condition may be congenital or acquired. The congenital form is more serious, resulting in crises of acute abdominal pain and certain neurological complications. See also **porphyria.**

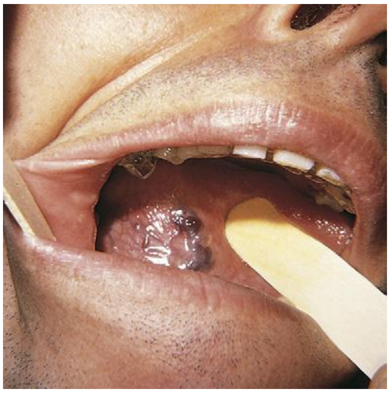
variola minor. See **alastrim.**

variola, variola major. See **smallpox.**

varioliform gastritis. See **erosive gastritis.**

varioloid /ver′ē·əloid′/ [L, *varius* + Gk, *eidos,* form], **1.** *adj,* resembling smallpox. **2.** *v,* a mild form of smallpox in a vaccinated person or one who has previously had the disease.

varix /ver′iks/ *pl.* **varices** [L, varicose vein], a tortuous, dilated vein, artery, or lymphatic vessel.



Varix *(Swartz, 2009)*

varnish /vär′nish/, a solution of natural resins and gums or concentrated fluoride used as a protective coating over the surfaces of a dental cavity preparation before restorative material is applied or over a tooth surface after sealing and root planing. Fluoride varnish occludes dentinal tubules, resulting in caries prevention and reduced dental hypersensitivity.

varus /ver′əs/ [L, bent], describing an abnormal position in which a part of a limb is turned inward toward the midline, such as the great toe in **hallux varus.** Compare **valgus.**

vas /vas/ *pl. vasa* [L, vessel], any one of the many vessels of the body, especially those that convey blood, lymph, or spermatozoa.

vas afferens, a small arteriole that supplies blood to a renal glomerulus. Also called **afferent glomerular arteriole.**

vasa vasorum [L, *vas,* vessel], small blood vessels that supply the walls of the arteries and veins.

vascular /vas′kyələr/ [L, *vasculum,* little vessel], pertaining to a blood vessel.

vascular access device (VAD), an indwelling catheter, cannula, or other instrument used to obtain venous or arterial access.

vascular death, a death caused by vascular pathological conditions.

vascular endothelial growth factor (VEGF), a peptide factor that stimulates the proliferation of cells of the endothelium of blood vessels. It promotes tissue vascularization and is important in blood vessel formation in tumors. It exists in four forms with different lengths (121, 165, 189, and 206 amino acids). Levels are elevated in hypoxia. Also called **vascular permeability factor.**

vascular endothelium, the endothelium that lines the blood vessels.

vascular fasciculus, a fasciculus in the zona externa of the renal medulla.

vascular headache, a classification for certain types of headaches, based on a proposed cause involving abnormal functioning of the blood vessels or vascular system of the brain; included are migraine, cluster headache, toxic headache, and headache caused by elevated blood pressure.

vascular hemophilia, Not in common usage. See **von Willebrand disease.**

vascular insufficiency, inadequate peripheral blood flow. Causes include occlusion of vessels by atherosclerotic plaques, thrombi, or emboli; damaged, diseased, or intrinsically weak vascular walls; arteriovenous fistulas; hematologic hypercoagulability; and heavy smoking. Signs of vascular insufficiency include pale, cyanotic, or mottled skin over the affected area; swelling of an extremity; absent or reduced tactile sensation; tingling; diminished sense of temperature; muscle pain, such as intermittent claudication in the calf; and, in advanced disease, ulcers and atrophy of muscles in the involved extremity. Diagnosis may be made by comparing peripheral pulses in contralateral extremities or by angiography, plethysmography, ultrasonography, and skin temperature tests. Treatment of vascular insufficiency may include a diet low in saturated fats, moderate exercise, sleeping on a firm mattress, avoidance of tobacco products, proper standing or sitting posture, elevation of the involved extremity, use of a vasodilating drug, and, if indicated, repair of an arteriovenous fistula or aneurysm or bypass surgery. See also **arterial insufficiency.**

vascularity /vas′kyəler′itē/ [L, *vasculum,* little vessel], the state of blood vessel development and functioning in an organ or tissue.

vascularization /vas′kyəler′īzā′shən/, the process by which body tissue develops proliferating capillaries. It may be natural or induced by surgical techniques. —*vascularize, v.*

vascularized graft, a graft in which the blood supply to the grafted tissue is maintained, as with a pedicle flap.

vascular leiomyoma, a neoplasm that has developed from smooth muscle fibers of a blood vessel.

vascular permeability factor. See **vascular endothelial growth factor.**

vascular pole of renal corpuscle, the end of the corpuscle and glomerulus where afferent arterioles enter and efferent arterioles exit.

vascular sclerosis [L, *vasculum* + Gk, *skerosis,* hardening], a condition of hyaline degeneration of the blood vessels with hypertrophy of the tunica media and subintimal fibrosis. There also may be a weakening and loss of elasticity in the artery walls.

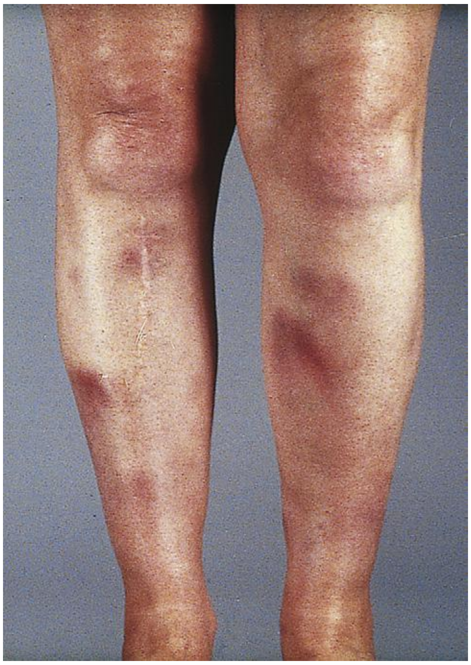
vascular spider. See **spider angioma.**

vascular tumor. See **aneurysm.**

vascular ultrasound studies, ultrasound studies of the extremities, used to identify vein or artery occlusion.

vasculature /vas′kyəlā′chər/ [L, *vasculum*], the blood vessels in an organ or tissue.

vasculitis /vas′kyəlī′tis/, inflammation of the blood vessels. It may be caused by a systemic disease or an allergic reaction. Kinds of vasculitis are **allergic vasculitis, necrotizing vasculitis,** and **segmented hyalinizing vasculitis.** See also **angiitis.**



Nodular vasculitis *(du Vivier, 2002)*

vasculogenic impotence /vas′kyəlōjen′ik/ [L, *vasculum,* little vessel; Gk, *genein,* to produce; L, *in* + *potentia,* power], impotence resulting from an inadequate supply of arterial blood to the penis or venous leakage.

vasculomotor. See **vasomotor.**

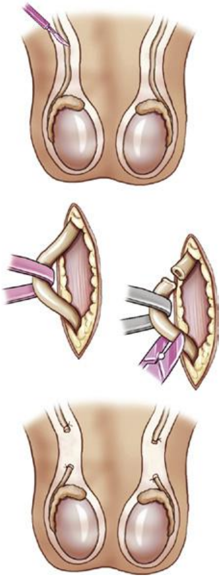
vas deferens /def′ərənz/ *pl. vasa deferentia* [L, *vas* + *deferens,* carrying away], the extension of the epididymis of the testis that ascends from the scrotum into the abdominal cavity and joins the seminal vesicle to form the ejaculatory duct. It is enclosed by fibrous connective tissue with blood vessels, nerves, and lymphatics and passes through the inguinal canal as part of the spermatic cord. Also called **deferent duct, ductus deferens, spermatic duct, testicular duct.** See also **testis.**

vasectomy /vasek′təmē/ [L, *vas* + Gk, *ektomē,* excision], a procedure for male sterilization involving the bilateral surgical removal of a part of the vas deferens. Vasectomy is most commonly performed at an outpatient surgery center with local anesthesia. The procedure is also performed routinely before removal of the prostate gland to prevent inflammation of the testes and epididymides. Potency is not affected.

vasectomy reversal. See **vasovasostomy.**

vaso- /vas′ō-, vā′sō/, prefix meaning "vessel or duct": *vasoconstrictor, vasodilation, vasoganglion.*

vasoactive /vā′zō·ak′tiv/ [L, *vas* + *activus,* active], (of a drug) tending to cause vasodilation or vasoconstriction.



Vasectomy *(LaFleur Brooks and LaFleur Brooks, 2012)*

vasoactive intestinal polypeptide (VIP), a glucagon-secretin hormone found in the pancreas, intestine, and central nervous system. The hormone stimulates insulin and glucagon release. Gastric secretion, gastric motility, and peripheral vasodilation, as well as hyperglycemia by hepatic glycogenolysis, are inhibited. See also **VIPoma.**

vasoconstriction [L, *vas* + *constrigere,* to tighten], a decrease in the diameter of a blood vessel. It plays an important role in the control of blood pressure and the distribution of blood throughout the body. Vasoconstriction is triggered by stimulation of the vasomotor constriction center in the medulla. Impulses from this center travel along sympathetic nerve fibers and cause contraction of the smooth muscle layers of arteries, arterioles, and, to a lesser extent, venules, and veins, bringing about constriction of these vessels. Vasoconstriction is also induced by vasomotor pressure reflexes, chemical reflexes, the medullary ischemic reflex, and impulses from the cerebral cortex and the hypothalamus. Compare **vasodilation.** —**vasoconstrictive,** *adj.*

vasoconstrictive /-kənstrik′tiv/ [L, *vas,* vessel, *constringere,* to draw tight], able to cause a constriction of blood vessels.

vasoconstrictor /-kənstrik′tər/ [L, *vas* + *constrigere*], **1.** *adj,* pertaining to a process, condition, or substance that causes the constriction of blood vessels. **2.** *n,* also called **vasopressor.** an agent that promotes vasoconstriction. Cold, fear, stress, and nicotine are common exogenous vasoconstrictors. Internally secreted epinephrine and norepinephrine cause blood vessels to contract by stimulating alpha-adrenergic receptors on the vascular smooth muscle. Other endogenous vasoconstrictors are angiotensin, which is formed in the blood through the action of renin, and antidiuretic hormone, which is secreted by the pituitary. Alpha-adrenergic sympathomimetic drugs also cause vasoconstriction, and several of these agents are used for this action in maintaining blood pressure during anesthesia and in treating pronounced hypotension resulting from hemorrhage, myocardial infarction, septicemia, sympathectomy, or drug reactions. Among these therapeutic agents are phenylephrine, metaraminol, and norepinephrine.

vasodepressor syncope. See **vasovagal syncope.**

vasodilation /-dīlā′shən/ [L, *vas* + *dilatare*], an increase in the diameter of a blood vessel. It is caused by a relaxation of the smooth muscles in the vessel wall. Also called *vasodilatation*. Compare **vasoconstriction.**

vasodilator /vā′zōdī′lātər/ [L, *vas* + *dilatare*], a nerve or agent that causes dilation of blood vessels by promoting the relaxation of vascular smooth muscle. Chemical vasodilators include hydralazine, nitroglycerin, nitroprusside, nesiritide, and trimethaphan. They have been useful in the treatment of acute heart failure in myocardial infarction, in cases associated with severe mitral regurgitation, and in failure resulting from myocardial disease.

vasoganglion /-gang′glē·on/, a spherical mass of small blood vessels.

vasogenic shock /-jen′ik/ [L, *vas* + *genein,* to produce; Fr, *choc*], shock resulting from peripheral vascular dilation produced by factors such as toxins that directly affect the blood vessels. Examples of vasogenic shock include **anaphylactic shock** and **septic shock.**

vasohypertonic /-hī′pərton′ik/, causing constriction of blood vessels.

vasoinhibitor /vas′ō·inhib′itər/, an agent that opposes the action of vasomotor nerves, thereby causing arterial dilation and reduced blood pressure.

vasoinhibitory /vas′ō·inhib′itôr′ē/, inhibiting the activity of vasomotor nerves.

vasomotor /-mō′tər/ [L, *vas* + *movere,* to move], pertaining to the nerves and muscles that control the diameter of the blood vessels. Circularly arranged smooth muscle fibers of arteries and arterioles can contract, causing vasoconstriction, or they can relax, causing vasodilation. Also called **vasculomotor.**

vasomotor center, a collection of cell bodies in the medulla oblongata of the brain that regulates or modulates blood pressure and cardiac function, primarily via the autonomic nervous system.

vasomotor epilepsy, a form of epilepsy characterized by episodes of autonomic dysfunction and extreme contractions of the arteries. Also called **autonomic epilepsy.**

vasomotor paralysis, hypotonia of blood vessels caused by blockage of activity in nerves that stimulate vascular constriction. Also called **vasoparalysis.** See also **vasoparesis.**

vasomotor reflex [L, *vas,* vessel, *movere,* to move, *reflectere,* to bend back], any reflex response of the circulatory system caused by stimulation of vasodilator or vasoconstrictive nerves.

vasomotor rhinitis, chronic rhinitis and nasal obstruction, without allergy or infection, characterized by sneezing, rhinorrhea, nasal obstruction, and vascular engorgement of the mucous membranes of the nose. A vaporizer or humidifier and systemic vasoconstrictive agents are used to alleviate discomfort. Nose drops and nasal sprays should be avoided because continued use may cause further vasodilation of the mucous membrane and aggravation of the condition. Topical vasoconstrictors should also be avoided because the nasal mucous membrane loses sensitivity to stimuli. Vasomotor rhinitis is common in pregnancy.

vasomotor spasm. See **angiospasm.**

vasomotor system, the part of the nervous system that controls the constriction and dilation of the blood vessels. See also **vasoconstriction, vasodilation.**

vasoparalysis. See **vasomotor paralysis.**

vasoparesis, a mild form of **vasomotor paralysis.**

vasopressin. See **antidiuretic hormone.**

vasopressor. See **vasoconstrictor.**

vasospasm. See **angiospasm.**

vasospastic /-spas′tik/, **1.** *adj,* relating to a spasmodic constriction of a blood vessel. **2.** *n,* any agent that produces spasms of the blood vessels.

vasospastic angina, chest pain caused by spasms of the coronary arteries. It has features that differ from those of angina pectoris. See also **Prinzmetal's angina.**

vasostimulation /-stim′yəlā′shən/ [L, *vas,* vessel, *stimulare,* to incite], the promotion of vasomotor activity.

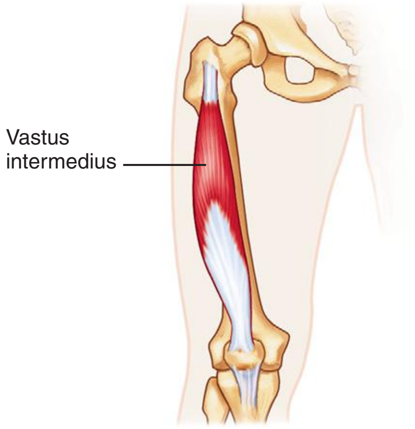
Vasotec, a trademark for an angiotensin-converting enzyme inhibitor **(enalapril maleate).**

vasovagal reflex, a stimulation of the vagus nerve by reflex in which irritation of the larynx or the trachea results in slowing of the pulse rate.

vasovagal syncope, a sudden loss of consciousness resulting from cerebral ischemia, secondary to decreased cardiac output, peripheral vasodilation, and bradycardia and associated with vagal activity. The condition may be triggered by pain, fright, or trauma and is accompanied by symptoms of nausea, pallor, and perspiration. Also called **vasodepressor syncope.**

vasovasostomy /vas′ōvəsos′təmē/ [L, *vas* + *vas* + Gk, *stoma,* mouth], a surgical procedure in which the function of the vas deferens on each side of the testes is restored, having been cut and ligated in a preceding vasectomy. The procedure is performed if a man wants to regain his fertility. In most cases the patency of the canals is achieved, but, in many cases, fertility does not result, probably because of circulating autoantibodies that disrupt normal sperm activity. The antibodies apparently develop after vasectomy because the developing sperm cannot be excreted through the urogenital tract. Also called **vasectomy reversal.**

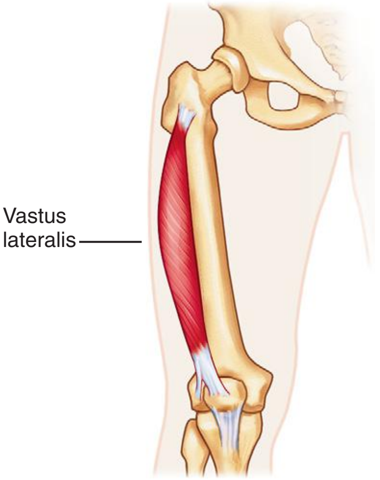
vastus intermedius /vas′təs/ [L, *vastus,* enormous, *inter,* between, *mediare,* to divide], one of the four muscles of the quadriceps femoris group, situated in the center of the thigh under the rectus femoris. It arises from the front and lateral surfaces of the femur and the medial and lateral intermuscular septa. Its fibers end in a superficial aponeurosis that forms the deep part of the quadriceps femoris tendon, inserted under the patella and onto the tibial tuberosity. It functions with the other three muscles of the quadriceps to extend the leg. Its deepest fibers are called articularis genus. Also called **crureus.** Compare **rectus femoris, vastus lateralis, vastus medialis.** See also **quadriceps femoris.**



Vastus intermedius

vastus internus. See **vastus medialis.**

vastus lateralis, the largest of the four muscles of the quadriceps femoris group, situated on the lateral side of the thigh. It is a large, dense mass originating in a broad aponeurosis that is attached to the intertrochanteric line of the femur, the greater trochanter, the lateral lip of the gluteal tuberosity, and the lateral lip of the linea aspera. The fibers of the muscle are gathered to form a strong aponeurosis that converges to become a flat tendon before inserting under the patella and onto the lateral condyle of the tibia. The muscle functions to help extend the leg. Compare **rectus femoris, vastus intermedius, vastus medialis.** See also **quadriceps femoris.**



Vastus lateralis

vastus medialis, one of the four muscles of the quadriceps femoris group, situated in the medial part of the thigh. It originates from the intertrochanteric line of the femur, the linea aspera, the medial supracondylar line, the tendons of the adductor longus and the adductor magnus, and the medial intermuscular septum. The vastus medialis extends to the lower anterior aspect of the thigh and inserts by an aponeurosis under the patella as part of the quadriceps femoris tendon and onto the medial condyle of the femur. An expansion of the aponeurosis passes to the capsule of the knee joint. The muscle functions in combination with other parts of the quadriceps femoris to extend the leg. Also called **vastus internus.** Compare **rectus femoris, vastus intermedius, vastus lateralis.** See also **quadriceps femoris.**

VATER association. See **VATER complex.**

VATER complex, a nonrandom association of congenital anomalies consisting of *v*ertebral defects, imperforate *a*nus, *t*racheo*e*sophageal fistula, and *r*adial and *r*enal dysplasia. Also called **VATER association.**

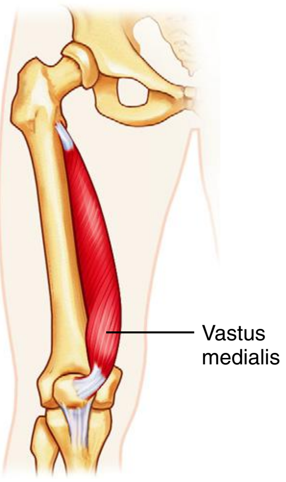
Vater-Pacini corpuscles /fä′tər päsē′nē/ [Abraham Vater, German anatomist, 1684–1751; Filippo Pacini, Italian anatomist, 1812–1883], kinesioceptors located in joint capsules and ligaments. They may transmit nerve impulses at an increasing rate as a joint approaches its maximal range of motion and are believed to have a protective function of signaling the cerebral cortex when a joint has reached the end position of its range. They are the most complicated of the nerve endings.

Vater's ampulla. See **hepatopancreatic ampulla.**

VBP, an anticancer drug combination of vinBLAStine, bleomycin, and cisplatin. Also called **PVB.**

VC, abbreviation for **vital capacity.**

VCO$_2$, symbol for carbon dioxide output per unit of time.



Vastus medialis

VCU, abbreviation for **voiding cystourethrography.**

VD, abbreviation for **venereal disease.** See **sexually transmitted disease.**

V deflection /diflek′shən/, a deflection on the His bundle electrogram that represents ventricular activation.

VDRL, abbreviation for *Venereal Disease Research Laboratories*.

VDRL test, abbreviation for *Venereal Disease Research Laboratory test,* a serological flocculation test for syphilis. It is also positive in other treponemal diseases such as yaws. False-positive and false-negative results may occur. A positive test must be confirmed by further, more definitive testing.

VDT, abbreviation for **video display terminal.**

V̇e, symbol for *expired volume*.

V̇E, symbol for *volume expired in 1 minute*.

Vectibix, a trademark for **panitumumab.**

vector /vek′tər/ [L, carrier], **1.** a quantity having direction and magnitude, usually depicted by a straight arrow. The length of the arrow represents magnitude, and the head represents direction. **2.** a carrier, especially one that transmits disease. A **biological vector** is usually an arthropod in which the infecting organism completes part of its life cycle. A **mechanical vector** transmits the infecting organism from one host to another but is not essential to the life cycle of the parasite. Kinds of vectors include dogs, which carry rabies; mosquitoes, which transmit malaria; and ticks, which carry Rocky Mountain spotted fever. **3.** a retrovirus that has been modified by alteration of its genetic component. Through recombinant deoxyribonucleic acid techniques, genes that cause harmful effects such as cancer are removed and genes that mediate synthesis of essential enzymes are added. The vector then can be injected into a patient who suffers from an enzyme deficiency, such as Lesch-Nyhan syndrome. **—***vector, v.,* **vectorial,** *adj*.

vectorcardiogram /-kär′dē·əgram′/ [L, *vector,* carrier; Gk, *kardia,* heart, *gramma,* record], a tracing of the direction and magnitude of the heart's electrical activity during a cardiac cycle. It is produced by an oscilloscope, which simultaneously records three standard leads.

vectorcardiography /-kär′dē·og′rəfē/ [L, *vector,* carrier; Gk, *kardia,* heart, *graphein,* to record], a method of recording the direction and magnitude of the heart's electric activity.

vectorial. See **vector.**

vecuronium bromide /vek′yərō′nē·əm/, a neuromuscular blocking drug.

■ INDICATIONS: This drug is used as an adjunct to general anesthesia, to facilitate endotracheal intubation, and to relax skeletal muscles during surgery or mechanical ventilation.

■ CONTRAINDICATIONS: This drug should be used cautiously in patients with myasthenia gravis or other neuromuscular disorders and in patients who have been given drugs that produce or increase neuromuscular block. Effects of vecuronium may be prolonged in patients with liver disease.

■ ADVERSE EFFECTS: No serious adverse effects have been reported.

VEE, abbreviation for **Venezuelan equine encephalitis.** See **equine encephalitis.**

Veetids, a trademark for an antibacterial (penicillin V potassium).

vegan. See **strict vegetarian.**

veganism /vej′əniz′əm/ [L, *vegetare,* to grow, *ismus,* practice], the adherence to a strict vegetarian diet, with the exclusion of all protein of animal origin.

vegetable albumin /vej′(i)təbəl/, albumin protein produced in plants.

vegetal pole /vej′ətəl/ [L, *vegetare* + *polus,* pole], the relatively inactive part of an ovum where the yolk is situated, usually opposite the animal pole. Also called **antigerminal pole, vegetative pole.** Compare **animal pole.**

vegetarian /vej′əter′ē·ən/ [L, *vegetare*], a person who eats only foods of plant origin, including fruits, grains, and nuts. Many vegetarians eat eggs and milk products but avoid all animal flesh. Kinds of vegetarians are **lacto-ovo-vegetarian, ovo-vegetarian,** and **strict vegetarian.**

vegetarianism /vej′əter′ē·əniz′əm/, the theory or practice of eating only foods of plant origin, including fruits, grains, and nuts.

vegetate, to behave or grow in the manner of a plant. See **vegetative.**

vegetation /vej′ətā′shən/, an abnormal growth of tissue around a valve, composed of fibrin, platelets, and bacteria.

vegetative /vej′ətā′tiv, vej′ətətiv′/ [L, *vegetare*], **1.** pertaining to nutrition and growth. **2.** pertaining to the plant kingdom. **3.** denoting involuntary function, as produced by the parasympathetic nervous system. **4.** resting, not active; denoting the stage of the cell cycle in which the cell is not replicating. **5.** leading a secluded, dull existence without social or intellectual activity; sluggish; lacking animation. **6.** (in psychiatry) emotionally withdrawn and passive, as may occur in schizophrenia and depression or in unipolar depression in severe cases. **—vegetate,** *v.*

vegetative endocarditis [L, *vegetare,* to grow; Gk, *endon,* within, *kardia,* heart, *itis,* inflammation], a subacute form of bacterial endocarditis characterized by vegetation on the heart valves. The vegetation may cause ulceration and perforation of the heart valve cusps.

vegetative pole. See **vegetal pole.**

vegetative state, a physical condition in which a previously comatose patient continues to be unable to communicate or respond to stimuli, despite at times giving the appearance of wakefulness. The eyes may be open, but, because of senile brain disease, cerebral arteriosclerosis, or injury to the cerebral cortex, the patient remains immobile and must be fed and toileted, and all other physical needs must be attended to. It is important to speak to the patient, since it is not known whether the patient can hear.

VEGF, abbreviation for **vascular endothelial growth factor.**

vehicle /vē′ikəl/ [L, *vehiculum,* conveyance], **1.** an inert substance with which a medication is mixed to facilitate measurement and administration or application. **2.** any fluid or structure in the body that passively conveys a stimulus. **3.** any substance, such as food or water, that can serve as a mode of transmission for infectious agents.

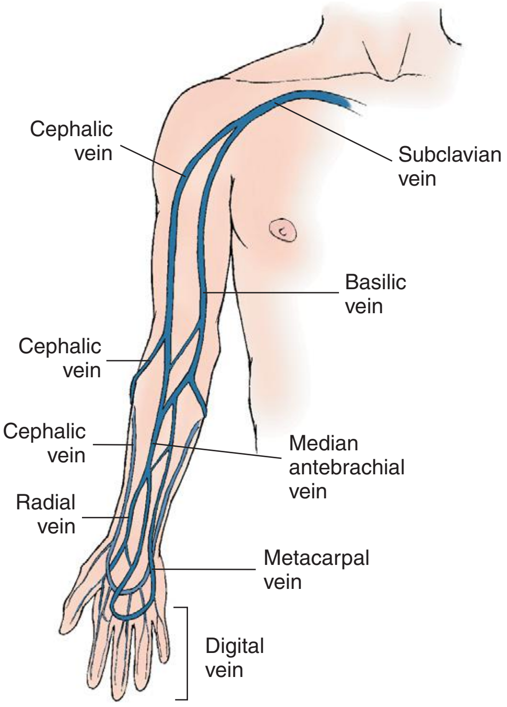
vehicle safety promotion, a nursing intervention from the Nursing Interventions Classification (NIC) defined as assisting individuals, families, and communities to increase awareness of measures to reduce unintentional injuries in motorized and nonmotorized vehicles. See also **Nursing Interventions Classification.**

veiling glare, loss of contrast due to light scattering within a lens system, as in a fluoroscopic image intensifier.

Veillonella /vā′yənel′ə/ [Adrien Veillon, French bacteriologist, 1864–1931], a genus of gram-negative anaerobic bacteria. The species *Veillonella parvula* is normally present in the alimentary tract, especially in the mouth. This infection is often mistaken for more serious gonococcal infection.

Veillon tube /vāyōn′/, a transparent tube, the ends of which are closed with removable stoppers, one cotton and one rubber. It is used for the laboratory growth of bacteriological cultures.

vein (v) /vān/ [L, *vena*], any one of the many vessels that convey blood from the capillaries as part of the pulmonary venous system, the systemic venous network, or the portal venous complex. Most of the veins of the body are systemic veins that convey blood from the whole body (except the lungs) to the right atrium of the heart. Each vein is a macroscopic structure enclosed in three layers of different kinds of tissue homologous with the layers of the heart. The outer tunica adventitia of each vein is homologous with the epicardium, the tunica media with the myocardium, and the tunica intima with the endocardium. Deep veins course through the more internal parts of the body, and superficial veins lie near the surface, where many of them are



Veins in the arm *(Shade et al, 2007)* visible through the skin. Veins have thinner coatings and are less elastic than arteries and collapse when cut. They also contain semilunar valves at various intervals to control the direction of the blood flow back to the heart. Compare **artery.** See also **portal vein, pulmonary vein, systemic vein.** **—venous,** *adj.*

vein ligation and stripping, a surgical procedure consisting of the ligation of the saphenous vein and its removal from groin to ankle. It is performed for the treatment of recurrent thrombophlebitis or severe varicosities or for obtaining a blood vessel to graft in another site, such as in a coronary bypass operation.

vein lumen, the central opening through which blood flows in a vein.

vein of Thebesius. See **smallest cardiac vein.**

veins of the vertebral column, the veins that drain the blood from the vertebral column, adjacent muscles, and meninges of the spinal cord. Along the entire vertebral column these veins form plexuses that are divided into internal and external groups according to their locations inside or outside the vertebral canal. The plexuses and veins of the vertebral network are the external plexus, internal plexus, basivertebral veins, intervertebral veins, and spinal cord veins.

vein wrapping, the wrapping of an injured nerve with an autologous vein (usually saphenous vein) graft to provide insulation and cushioning following decompression in treatment of entrapment neuropathy.

Velban, a trademark for an antineoplastic **(vinBLAStine sulfate).**

Velcade, a trademark for **bortezomib.**

Velcro, a trademark for a type of fastening device with a surface of tiny hooks that adhere to the opposite side, used mainly on fabric products.

vellus hair. See **lanugo.**

velocardiofacial syndrome /vel′ō·kär′dē·ō·fā′shəl/, an autosomal-dominant syndrome of cardiac defects and characteristic craniofacial abnormalities, including cleft palate, jaw abnormalities, and prominent nose. It is often associated with abnormalities of chromosome 22. Learning disabilities occur often; short stature, slender hyperextensible hands and digits, scoliosis, mental retardation, inguinal hernia, auricular abnormalities, and microcephaly occur less frequently. Also called **Shprintzen's syndrome.**

velocity /vəlos′itē/ [L, *velox,* quick], the rate of change in the position of a body moving in a particular direction. Velocity along a straight line is linear velocity. Angular velocity is that of a body in circular motion. Compare **speed.**

velocity of growth, the rate of growth or change in growth measurements over a period of time.

velocity of ultrasound, the speed of ultrasound waves in a particular medium. The velocity varies from 331 meters per second (m/sec) in air to 1450 m/sec in fat, 1570 m/sec in blood, and 4080 m/sec in the skull.

velocity spectrum rehabilitation, a rehabilitation program that uses strength training at multiple speeds of movement from slow to fast.

velopharyngeal closure, closure of the nasal airway by the elevation of the soft palate and contraction of the posterior and lateral pharyngeal wall. It is needed for vowels and for all consonants except /n/, /m/, and /ng/.

velopharyngeal insufficiency, an abnormal condition resulting from a congenital defect in the structure of the velopharyngeal sphincter: Closure of the oral cavity beneath the nasal passages is not complete, as seen in cleft palate. Food may be regurgitated through the nose, and speech is impaired. Surgical correction is usually successful.

Velosef, a trademark for a cephalosporin antibiotic **(cephradine).**

Velpeau's bandage /velpōz′/ [Alfred A.L.M. Velpeau, French surgeon, 1795–1867], a roller bandage that immobilizes the elbow and shoulder by holding the brachium against the side and the flexed forearm on the chest. The palm of the hand rests on the clavicle of the opposite side.

ventricular phonation, a disorder of speech usually caused by muscular dysfunction and/or folds that vibrate with the vocal cords. It is characterized by a deep tone and strained sound.

vena cava /vē′nə kā′və/ *pl. venae cavae* [L, *vena,* vein, *cavum,* cavity], one of two large veins returning blood from the peripheral circulation to the right atrium of the heart. See also **inferior vena cava, superior vena cava.** **—***vena caval, adj.*

vena caval foramen, an opening in the diaphragm through which the inferior vena cava and vagus nerve pass.

vena caval syndrome. See **supine hypotension.**

vena comitans *pl. venae comites,* one of the deep paired veins that accompany the smaller arteries on each side of the artery. The three vessels are wrapped together in one sheath. Some of the arteries accompanied by such venous pairs are the brachial, the ulnar, and the tibial.

vena cordis magna. See **great cardiac vein.**

veneer /vənir′/ [Fr, *fournir,* to furnish], **1.** a layer of tooth-colored material, usually porcelain or acrylic, attached to the surface of a crown or artificial tooth by direct fusion; a porcelain prosthesis used to change the shape, size, and color of a tooth or teeth. The prosthesis is directly cemented to the crown of the tooth or teeth. **2.** a thin layer of calculus usually not visible until dried with air. See **calculus.**

venepuncture. See **venipuncture.**

venereal /vənir′ē·əl/ [L, *Venus,* goddess of love], pertaining to or caused by sexual intercourse or genital contact.

venereal bubo [L, *Venus,* goddess of love; Gk, *boubon,* groin], a swollen, inflamed lymph gland or node, usually in the groin and sometimes purulent. It is associated with a sexually transmitted disease.

venereal disease. See **sexually transmitted disease.**

venereal sore. See **chancre.**

venereal ulcer. See **chancroid.**

venereal urethritis, an inflammation of the male urethra caused by sexually transmitted microorganisms. See also **gonococcal urethritis.**

venereal wart. See **genital wart.**

venereologic, venereological, pertaining to sexually transmitted diseases. See **venereology.**

venereologist /vənir′ē·ol′əjist/ [L, *Venus,* goddess of love; Gk, *logos,* science], a health professional who specializes in the study of the causes and treatments of venereal diseases.

venereology /-ol′əjē/, the study of the causes and treatments of venereal diseases. **—venereologic, venereological,** *adj.,* **venereologist,** *n.*

venerupin poisoning /ven′əro͞o′pin/, a potentially fatal form of shellfish poisoning that results from ingestion of oysters or clams contaminated with venerupin, a toxin that causes impaired liver functioning, GI distress, and leukocytosis. The shellfish toxin occurs in waters around Japan. About one third of the cases are fatal. See also **shellfish poisoning.**

venesection. See **phlebotomy.**

Venezuelan equine encephalitis. See **equine encephalitis.**

Venezuelan hemorrhagic fever, a hemorrhagic fever caused by an arenavirus transmitted to humans by contact with or inhalation of aerosolized excreta of infected rodents. The disease occurs in west central Venezuela, primarily in settlers moving into areas of cleared forest. Initially it is characterized by the gradual onset of fever, malaise, myalgia, and anorexia, followed by prostration, dizziness, headache, back pain, and GI disturbances. Bleeding of the gums is a typical finding, and there may be petechiae on the palate and axillae. Neurological manifestations, such as tremor of tongue and hands, diminished deep tendon reflexes, lethargy, and hyperesthesia, often occur. Most patients begin to improve after 1 or 2 weeks, but the disease takes a more serious course in about a third; some patients develop a hemorrhagic diathesis; some develop severe neurological deterioration marked by delirium, coma, and convulsions; and still others develop a mixed hemorrhagic-neurological syndrome with shock. Treatment is supportive, with careful attention to fluid and electrolyte balance. If untreated, the case fatality rate may reach 30% or more. With aggressive treatment, the usual prognosis is complete recovery.

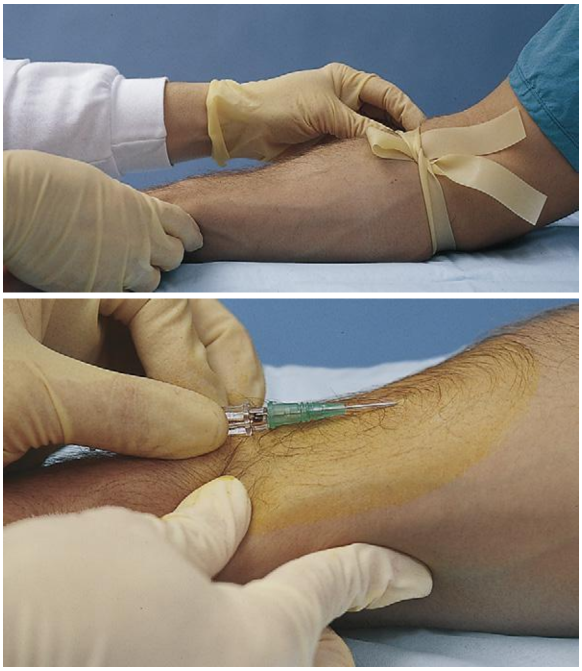
veni- [L, *vein*], prefix meaning 'vein':

venipuncture /ven′əpungk′chər/ [L, *vena* + *pungere,* to prick], the transcutaneous puncture of a vein by a sharp rigid stylet or cannula carrying a flexible plastic catheter or by a steel needle attached to a syringe or catheter. It is done to withdraw a specimen of blood, perform a phlebotomy, instill a medication, start an IV infusion, or inject a radiopaque substance for radiological examination of a part or system of the body. Also spelled **venepuncture.**

■ METHOD: The specific steps in performing a venipuncture vary with the purpose of the procedure and the equipment to be used, but in most instances it begins as follows: The nurse dons disposable gloves. A convenient vein is selected, usually on the outside of the forearm, on the back of the hand, or in the antecubital fossa. The vein is palpated, and to dilate the vein a tourniquet is wrapped around the arm proximal to the intended site of puncture. After cleansing the intended insertion site, the examiner avoids touching the site with the gloved finger(s). The vein is immobilized by applying traction on the skin around the puncture site. The stylet or needle is held at an angle of 30 degrees for direct venipuncture. In performing direct venipuncture, the tip of the needle is pointed in the direction of the flow of blood and advanced through the skin directly into the vein. The tip is usually inserted bevel side up; however, if a large-bore needle must be used in a small vein, it is preferable to insert the needle bevel side down because it is less likely to perforate the posterior wall of the vein. After the skin is punctured, little resistance is felt as the tip passes through the subcutaneous tissue, but a sudden slight resistance may be felt as the tip hits the wall of the vein. At this point the tip is cautiously advanced, with the needle or stylet held nearly flush with the skin. Slight upward pressure aids in keeping the tip in the vein as it is advanced into the lumen of the IV space. Blood flows back into the hub of the needle or into the catheter attached to the needle or covering the stylet, and the tip of the needle usually can be felt to be in the vein. If these signs are absent, the tip is not in the vein, in which case it is usually best to remove the needle or stylet, apply pressure to the puncture site, and start the procedure again, using new equipment.

■ INTERVENTIONS: Wing-tipped "butterfly" needles, various kinds of intracatheters, and single or multiple venipuncture needles require familiarity and practice for correct insertion and stabilization. A sterile dressing and an antimicrobial ointment are applied over the insertion site. The cleansing agent used to prepare the injection site may be iodine, povidone-iodine, or ethyl alcohol. If an iodine preparation or solution is to be used, the patient is first asked about any previous allergic reaction to iodine. To aid insertion of the tip into the vein, the patient may be asked to clench the fist to further dilate the vein. The use of the gloves helps to protect the health care worker from inadvertent contact with the patient's blood.

■ OUTCOME CRITERIA: Aseptic technique is required to avoid infection. A quick, skillful insertion is nearly painless for the patient. Specific sequelae to venipuncture vary with the techniques and equipment used. See also **intravenous infusion, phlebotomy.**



Venipuncture *(Potter and Perry, 2005)*

veno-, combining form meaning "vein": *venoclysis, venopressor, venovenostomy.*

venoatrial /vē′nō·ā′trē·əl/, pertaining to the right atrium and either vena cava.

venogenic impotence, vasculogenic impotence caused by a disorder in the veins draining the penis, such as a failure to maintain venous occlusion.

venogram. See **phlebogram.**

venography. See **phlebography.**

venom /ven′əm/ [L, *venenum,* poison], a toxic fluid substance secreted by some snakes, arthropods, and other animals and transmitted by their stings or bites.

venom extract therapy, the administration of antivenin as prophylaxis against the toxic effects of the bite of a specific poisonous snake or spider or other venomous animal.

venom immunotherapy, the reduction of sensitivity to a specific venom by the administration of gradually increasing amounts of that venom. See also **immunotherapy.**

venomous snake /ven′əməs/, a snake that secretes a poison. See also **adder, coral snake, pit viper, snakebite, snake venom.**

venospasm /vēn′əspaz′əm/ [L, *vena,* vein; Gk, *spasmos,* spasm], a spasmodic constriction of a vein.

venostasis. See **phlebostasis.**

venothrombotic /vē′nəthrombot′ik/, producing a venous thrombus.

venotomy /vēnot′əmē/, the surgical opening of a vein.

venous. See **vein.**

-venous, suffix meaning "veins": *endovenous, lymphovenous, perivenous*.

venous access device, a catheter designed for continuous access to the venous system. Such devices may be required for long-term parenteral feeding or the administration of IV fluids or medications for a period of several days.

venous access device (VAD) maintenance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as management of the patient with prolonged venous access via tunneled and nontunneled (percutaneous) catheters and implanted ports. See also **Nursing Interventions Classification.**

venous blood (v) [L, *vena,* vein; AS, *blod*], dark red deoxygenated blood that has passed from the left ventricle through the systemic circulation en route to the right atrium.

venous blood gas [L, *venosus,* full of veins; AS, *blod* + Gk, *chaos,* gas], the oxygen and carbon dioxide levels in venous blood. Venous blood gas is measured by various methods to assess the adequacy of oxygenation and ventilation and to determine the acid-base status. The oxygen tension of venous blood normally averages 40 mm Hg; the dissolved oxygen content, 0.1% by volume; the total oxygen content, 15.2%; and the oxygen saturation of venous hemoglobin, 75%. The carbon dioxide tension normally averages 46 mm Hg; the dissolved carbon dioxide content, 2.9% by volume; and the total carbon dioxide content, 50%. The normal average pH of venous plasma is 7.37. Venous blood gas in an extremity pertains chiefly to that limb. A sample from a central venous catheter is usually an incomplete mix of venous blood from various parts of the body; a sample of completely mixed venous blood may be obtained from the pulmonary artery for an accurate determination of venous blood gas.

venous capillaries [L, *vena,* vein, *capillaris,* hairlike], capillaries that terminate in venules.

venous circulation [L, *vena,* vein, *circulare,* to go around], the movement of blood from the venules, which drain deoxygenated blood from the capillaries, through the veins to the vena cava, and from there through the right atrium and ventricle to the pulmonary circulation of the lungs, where the blood is oxygenated for return to the systemic circulation.

venous cutdown, a small surgical incision made in a vein of a patient who has suffered vascular collapse to permit the introduction of IV fluids or drugs. A cutdown also may be performed for the insertion of a cannula for the withdrawal of blood.

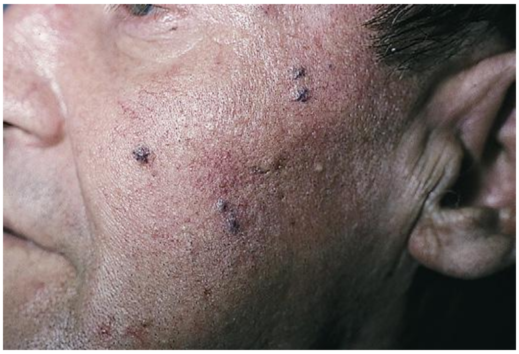
venous foramen, an aperture in the greater wing of the sphenoid bone, through which a small vein passes from the cavernous sinus. Also called **foramen of Vesalius.**

venous hemorrhage, the escape of blood from a vein.

venous hum, a continuous murmur heard on auscultation over the major veins at the base of the neck and around the umbilicus. It is most audible in the neck when the patient is anemic, upright, and looking to the contralateral side. It is also heard in some healthy, young individuals.

venous insufficiency, an abnormal circulatory condition characterized by decreased return of venous blood from the legs to the trunk of the body. Edema is usually the first sign of the condition. Pain, varicosities, and ulceration may follow. Treatment usually consists of elevation of the legs, use of elastic hose, and correction of the underlying condition.

venous lake, small benign blue-purple sessile, compressible papules or blebs seen most often on the lips, ears, and face of elderly persons, which histologically represent dilated capillaries filled with red blood cells and lined with flattened endothelial cells.



Venous lake *(Callen et al, 2000)*

venous ligation, the ligation of varicose veins whose valves are ineffective, performed to remove weakened parts of tissues in which thrombi might lodge. During surgery the saphenous vein is ligated at the groin, where it joins the femoral vein. A wire device, called a stripper, is threaded through the lumen of the vein from groin to ankle. The wire and the vein are then pulled from the groin incision. Incisions may be made at several sites along the leg. Bleeding is minimal. After surgery a pressure bandage is applied from foot to thigh, and the foot of the bed is elevated 6 to 9 inches, raising the legs above heart level. The patient is encouraged to walk but discouraged from standing or sitting. Cyanosis of the toes indicates possible constriction by the dressings. Elastic bandages remain in place until the seventh day after surgery, when the sutures are usually removed. Possible complications include hemorrhage, infection, nerve damage, and thrombosis.

venous occlusion, the blocking of venous return. It occurs naturally in the penis during an erection or it may be induced artificially in a part, such as in the arm, during venous occlusion plethysmography.

venous plethysmography, a manometric test that measures changes in the volume of an extremity. It is usually performed on a leg to exclude deep-vein thrombosis.

venous pressure, the blood pressure in the veins. It is elevated in congestive heart failure, acute or chronic constrictive pericarditis, and venous obstruction caused by a clot or external pressure against a vein. Indications of increased venous pressure are continued distension of veins on the back of the hand when it is raised above the sternal notch and distension of the neck veins when the individual is sitting with the head elevated 30 to 45 degrees.

venous pulse, the pulse of a vein usually palpated over the internal or external jugular veins in the neck. The pulse in the jugular vein is taken to evaluate the pressure of the pulse and the form of the pressure wave, especially in a person with a cardiac conduction defect or cardiac arrhythmia.

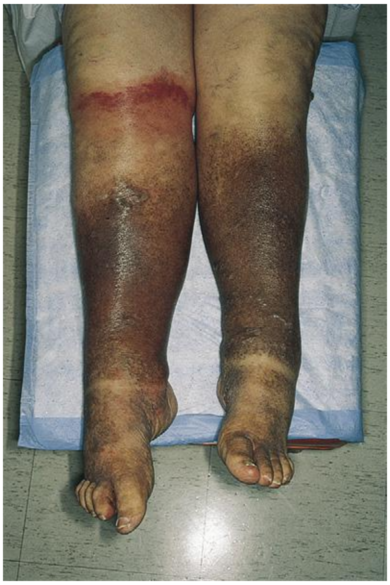
venous return, the return of blood to the heart via the superior and inferior vena cava and the coronary sinus.

venous sinus, any one of many sinuses that collect blood from the dura mater and drain it into the internal jugular vein. Each sinus is formed by the separation of the two layers of the dura mater, the outer coat of the sinus consisting of fibrous tissue and the inner coat consisting of endothelium continuous with that of the veins.

venous stasis, a disorder in which the normal flow of blood through a vein is slowed or halted.

venous stasis dermatitis. See **stasis dermatitis.**

venous thrombosis. See **phlebothrombosis.**



Venous stasis *(Swartz, 2009)*

venous valves, any of the small cusps or folds found in the tunica intima of many veins, serving to prevent backflow of blood.

ventilate /ven′tilāt/ [L, *ventilare,* to fan], **1.** to provide with fresh air. **2.** to provide the alveoli of the lungs with air from the atmosphere and to aerate or oxygenate blood in the pulmonary capillaries. **3.** to open discussion of something, such as one's feelings. **—ventilatory,** *adj.*

ventilation. See **respiration,** def. 2.

ventilation assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promotion of an optimal spontaneous breathing pattern that maximizes oxygen and carbon dioxide exchange in the lungs. See also **Nursing Interventions Classification.**

ventilation lung scan, a radiographic examination of the lungs to detect nonfunctional or impaired lung areas or other abnormalities, performed while the patient inhales a radioactive gas as a contrast medium.

ventilation-perfusion defect, a disorder in which one or more areas of the lungs receive air but no blood flow or receive blood flow but no air.

ventilation/perfusion (V/Q) ratio, the ratio of pulmonary alveolar ventilation to pulmonary capillary perfusion, both quantities expressed in the same units.

ventilator /ven′tilā′tər/, any of several devices used in respiratory therapy to provide assisted respiration and intensive positive-pressure breathing. Kinds of ventilators are **pressure ventilator** and **volume ventilator.** See also **IPPB unit.**

ventilator-associated pneumonia, the most common type of nosocomial pneumonia, a frequently fatal type seen in patients breathing with a ventilator. It is usually caused by aspiration of contaminated secretions or stomach contents and may be bacterial, viral, or fungal.

ventilatory. See **ventilate.**

ventilatory compliance /ven′tilətôr′ē/, the sum of the dynamic compliance of the lung and the compliance of the thoracic cage.

ventilatory rate [L, *ventilare,* to fan, *ratum,* to calculate], the volume of air passing into and out of the lungs per minute. Compare **respiration rate.**

ventilatory standstill [L, *ventilare,* to fan; AS, *standan* + *stille*], the complete cessation of breathing activity. Compare **apnea.**

venting [Fr, *vent,* breath], (in IV therapy) a method for allowing air to enter the vacuum of the IV bottle and displace the IV solution as it flows out. Glass IV bottles are usually equipped with a venting tube attached to the primary IV tubing or to a vent port incorporated with the bottle stopper. Venting is not required with a plastic IV bag because the bag collapses as the fluid runs out. The air vent attached to primary IV tubing is removable to allow the injection of medication.

Ventolin, a trademark for a bronchodilator **(albuterol).**

ventral /ven′trəl/ [L, *venter,* belly], pertaining to a position toward the anterior surface of the body; frontward. Compare **dorsal.**

-ventral, suffix meaning "of the stomach or abdominal region": *biventral, dorsoventral, uteroventral.*

ventral column. See **anterior horn.**

ventral corticospinal tract. See **anterior corticospinal tract.**

ventral hernia. See **abdominal hernia.**

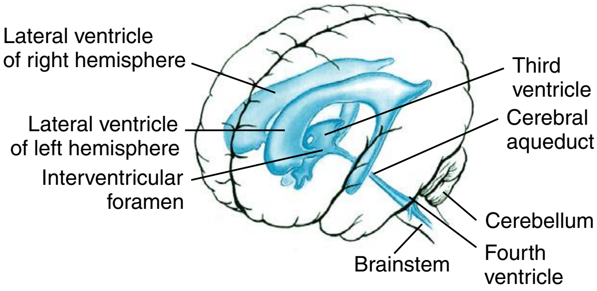
ventral horn. See **anterior horn.**

ventral recumbent. See **prone.**

ventral root [L, *venter,* belly; AS, *rot*], the anterior or motor division of each spinal nerve.

ventri-. See **ventro-.**

ventricle /ven′trikəl/ [L, *ventriculus,* little belly], a small cavity, such as the right and the left ventricles of the heart or one of the cavities filled with cerebrospinal fluid in the brain.



Ventricles of the brain *(Applegate, 2011)*

ventricles of the brain, the cavities within the brain that are filled with cerebrospinal fluid, including the two lateral, the third, and (linked by the aqueduct) the fourth ventricles. They are lined by ependyma which, in certain regions, is invaginated by vascular fringes of pia mater to form the choroid plexuses.

ventricular /ventrik′yələr/ [L, *ventriculus,* little belly], pertaining to a ventricle.

ventricular aberration. See **aberrant ventricular conduction.**

ventricular aneurysm, a localized dilation or saccular protrusion in the wall of a ventricle, occurring most often after a myocardial infarction. Scar tissue is formed in response to the inflammatory changes of the infarction. This tissue weakens the myocardium, allowing its walls to bulge outward when the ventricle contracts. A typical sign of the lesion is a recurrent ventricular arrhythmia that does not respond to treatment with conventional antiarrhythmic drugs. Diagnostic measures are echocardiography and cardiac catheterization. Treatment may involve surgical removal of the scar tissue. Also called **cardiac aneurysm.**

ventricular assist device (VAD) a circulatory support device that augments function of the left ventricle, the right ventricle, or both. It consists of one or two implanted or extracorporeal pumps with afferent and efferent conduits attached to provide mechanically assisted blood flow.

ventricular bigeminy [L, *ventriculus* + *bis* + *geminus,* twin], a cardiac arrhythmia in which every other beat consists of a premature ventricular beat.

ventricular block [L, *ventriculus* + OFr, *bloc*], an obstruction of the flow of cerebrospinal fluid. Causes usually are closure of the foramina of Magendie or Luschka. The condition results in a distension of the brain ventricles because of an increased accumulation of cerebrospinal fluid. See also **hydrocephalus.**

ventricular compliance, a property of a heart ventricle in its resting state that determines the relation between the filling of the ventricle and its diastolic pressure.

ventricular dysfunction, an abnormality in the contraction of the ventricles or the motion of the cells.

ventricular ejection [L, *ventriculus* + *ejicere,* to cast out], the forceful expulsion of blood from the ventricles into the aorta and the pulmonary arteries.

ventricular escape [L, *ventriculus* + OFr, *escaper*], the discharge of a normal ventricular pacemaker cell when the sinus or junctional rate of discharge falls below that of the ventricular pacemaker cells.

ventricular extrasystole, a premature beat arising from a ventricle.

ventricular fibrillation (VF), a cardiac arrhythmia marked by rapid depolarizations of the ventricular myocardium. The condition is characterized by a complete lack of organized electric activity and of ventricular ejection. Blood pressure falls to zero, resulting in unconsciousness. Death may occur within 4 minutes. Cardiopulmonary resuscitation must be initiated immediately, with defibrillation and resuscitative medications given according to advanced cardiac life support protocol.

ventricular flutter, a condition of very rapid contractions of the ventricles of the heart. Electrocardiograms show poorly defined QRS complexes occurring at a rate of 250 beats/min or higher. Cardiac output is severely compromised or absent. The condition is fatal if untreated. Compare **ventricular fibrillation.**

ventricular gallop. See **S_3.**

ventricular gradient, the sum of the areas within the QRS complex and the T wave on the electrocardiogram.

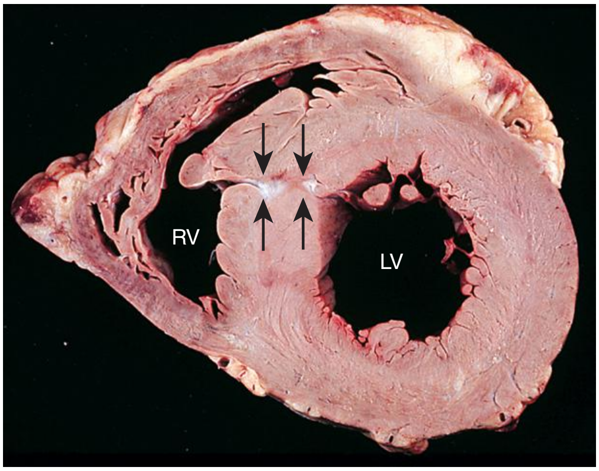
ventricular hypertrophy [L, *ventriculus* + Gk, *hyper,* excessive, *trophe,* nourishment], abnormal enlargement of the heart caused by enlargement of the myocardium. It is often caused by hypertension, a valvular disease, or heart failure.

ventricular pacing. See **pacing.**

ventricular remodeling, progressive myocardial ventricular dilation, eccentric ventricular hypertrophy, and distortion of left ventricular geometry that persist in the noninfarcted myocardium after a myocardial infarction has healed. It is associated with impaired functional capacity, congestive heart failure, and premature death. Angiotensin-converting enzyme inhibitors can limit the ventricular dilation.

ventricular rhythm [L, *ventriculus* + Gk, *rhythmos*], the recurrent beating of the ventricles, normal or abnormal.

ventricular septal defect (VSD), the most common congenital cardiac anomaly, characterized by one or more abnormal openings in the septum separating the ventricles. The openings, which may range in size from 1 to 2 mm to several centimeters, permit oxygenated blood to flow from the left to the right ventricle and to recirculate through the pulmonary artery and lungs. Small defects may close spontaneously, and children with such defects are usually asymptomatic. Large defects may lead to bacterial endocarditis, lower respiratory tract infections, pulmonary vascular obstructive disease, aortic regurgitation, or congestive heart failure. Children with large defects may show rapid breathing, poor weight gain, restlessness, and irritability. Diagnosis is established by echocardiography and cardiac catheterization. Treatment consists of surgical repair of the defect, preferably in early childhood. In certain cases, the defect may be closed via a percutaneous approach.



Ventricular septal defect that has undergone spontaneous closure *(Damjanov and Linder, 2000)*

ventricular septum. See **interventricular septum.**

ventricular standstill, a complete cessation of electric and mechanical activity in the ventricles of the heart.

ventricular systole [L, *ventriculus* + Gk, *systole,* contraction], the contraction of the heart ventricles. It begins with the first heart sound.

ventricular tachycardia, tachycardia of at least three consecutive ventricular complexes with a rate greater than 100 beats/min. It usually originates in a focus distal to the branching of the atrioventricular bundle.

ventriculo- /ventrik′yəlō-/, combining form meaning "ventricle of the heart or brain": *ventriculocisternostomy, ventriculopuncture, ventriculostium.*

ventriculoatrial shunt /ventrik′yəlō·ā′trē·əl/ [L, *ventriculus* + *atrium,* hall; ME, *shunten*], a surgically created passageway consisting of plastic tubing and one-way valves, implanted between a cerebral ventricle and the right atrium of the heart to drain excess cerebrospinal fluid from the brain in hydrocephalus.

ventriculoatriostomy. See **auriculoventriculostomy.**

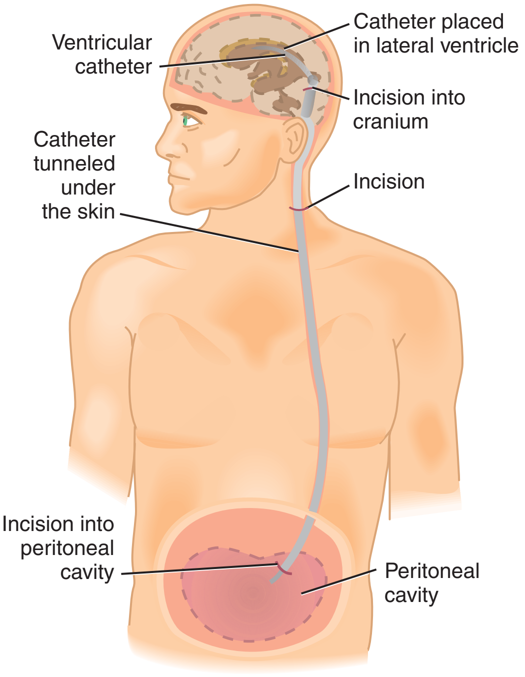
ventriculocisternostomy /-sis′tərnos′təmē/ [L, *ventriculus* + *cisterna,* vessel; Gk, *stoma,* mouth], a surgical procedure performed to treat hydrocephalus. An opening is created that allows cerebrospinal fluid to drain through a shunt from the ventricles of the brain into the cisterna magna. Also called **Torkildsen's procedure, ventriculostomy.**

ventriculofallopian tube shunt /-fəlō′pē·ən/, a surgical procedure with limited effectiveness for diverting cerebrospinal fluid into the peritoneal cavity. A polyethylene tube is passed from the lateral ventricle or from the spinal subarachnoid space into a ligated fallopian tube and finally into the peritoneal cavity, where the shunted cerebrospinal fluid is absorbed. This procedure is used to correct both the obstructive and the communicating types of hydrocephalus. Also called **spinofallopian tube shunt.**

ventriculogram /ventrik′yəlōgram′/, a radiograph of the cerebral ventricles or the ventricles of the heart.

ventriculography /ventrik′yəlog′rəfē/ [L, *ventriculus* + *graphein,* to record], **1.** the radiographic examination of a ventricle of the heart after injection of a radiopaque contrast medium. **2.** the radiographic examination of the head following cerebrospinal fluid removal from the cerebral ventricles and its replacement by a contrast medium, usually air.

ventriculoperitoneal shunt /-per′itənē′əl/ [L, *ventriculus* + Gk, *peri,* around, *teinein,* to stretch; ME, *shunten*], a surgically created passageway consisting of plastic tubing and one-way valves between a cerebral ventricle and the peritoneum for the draining of excess cerebrospinal fluid from the brain in hydrocephalus.



Ventricular catheter
Catheter placed in lateral ventricle
Incision into cranium
Catheter tunneled under the skin
Incision
Incision into peritoneal cavity
Peritoneal cavity

Ventriculoperitoneal shunt *(Black and Hawks, 2009)*

ventriculoperitoneostomy /ventrik′yəlōper′itō′nē·os′təmē/ [L, *ventriculus* + Gk, *peri,* around, *teinein,* to stretch, *stoma,* mouth], a surgical procedure for temporarily diverting cerebrospinal fluid in hydrocephalus, usually in the newborn. In this procedure, which spares the kidney but is less efficient than a ventriculoureterostomy, a polyethylene tube is passed from the lateral ventricle subcutaneously down the dorsal spine and is reinserted into the peritoneal cavity, where the diverted fluid is absorbed. This procedure is used to correct both the communicating and the obstructive types of hydrocephalus.

ventriculopleural shunt /-plo͝or′əl/ [L, *ventriculus* + Gk, *pleura,* rib; ME, *shunten*], a surgical procedure for diverting cerebrospinal fluid from engorged ventricles in hydrocephalus, usually in the newborn. In this procedure, cerebrospinal fluid is diverted from the lateral ventricle into the pleural cavity. It is used to correct both the obstructive and the communicating types of hydrocephalus.

ventriculostomy. See **ventriculocisternostomy.**

ventriculoureterostomy /ventrik′yəlō′yo͝orē′təros′təmē/ [L, *ventriculus* + Gk, *oureter,* ureter, *stoma,* mouth], a surgical procedure for directing cerebrospinal fluid into the general circulation. It is performed in the treatment of hydrocephalus, usually in the newborn. In this procedure a polyethylene tube is passed from the lateral ventricle down the dorsal spine subcutaneously to the twelfth rib; the tube is inserted through the paraspinal muscles into a ureter. Rarely used, the method is an alternative to auriculoventriculostomy, especially if the obstruction to cerebrospinal fluid includes the basilar and cerebral subarachnoid spaces, the posterior fossa, and the spinal subarachnoid spaces. The procedure is performed to correct an obstructive type of hydrocephalus.

ventriculovenous shunt, a surgically created communication between a cerebral ventricle and the internal jugular vein by a plastic tube with an in-line pressure-flow regulator, to permit drainage of cerebrospinal fluid for relief of hydrocephalus.

ventro-, ventri-, combining form meaning ‘belly or to the front of the body’: *ventrodorsal, ventrolateral, ventroptosia.*

ventrolateral /ven′trōlat′ərəl/, pertaining to the part of the body opposite the back and away from the midline.

ventromedial /ven′trōmē′dē·əl/, pertaining to the part of the body opposite the back and near the midline.

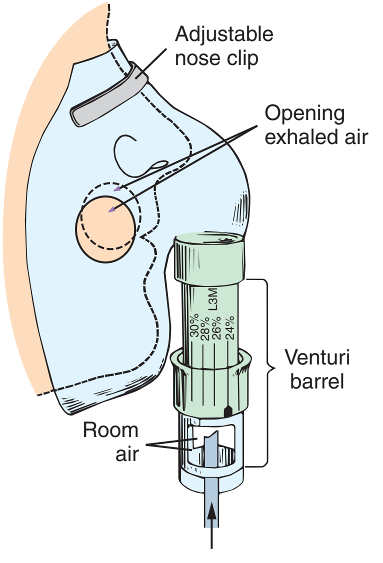
Venturi effect /vento͞o′rē/ [Giovanni B. Venturi, Italian physicist, 1746–1822], a modification of Bernoulli’s principle, which states that the pressure of a gas is reduced just beyond an obstruction or restriction in the vessel through which the gas is flowing. The pressure drop can be nearly eliminated if dilation of the vessel does not exceed 15 degrees. The effect is a factor in the design of respiratory therapy equipment for mixing medical gases.

Venturi mask, a respiratory therapy face mask designed to allow inspired air to mix with oxygen, which is supplied through a jet at a fixed concentration.

venul-, prefix meaning “venule”: *venulitis, venuloma.*

venule /ven′yo͞ol/ [L, *venula,* small vein], any one of the small blood vessels that gather blood from the capillary plexuses and anastomose to form the veins. —*venular, adj.*

VEP, abbreviation for **visual-evoked potential.**



Venturi mask *(Perry, Potter, and Elkin, 2012)*

VePesid (VP-16), a trademark for an antineoplastic agent **(etoposide).**

verapamil /verap′əmil/, a calcium channel blocker.
■ INDICATIONS: It is prescribed for the treatment of vasospastic and exertional angina, supraventricular tachycardia, atrial fibrillation, and atrial flutter.
■ CONTRAINDICATIONS: Severe left ventricular dysfunction, hypotension, cardiogenic shock, sick sinus syndrome, or second- or third-degree atrioventricular (AV) block prohibits its use.
■ ADVERSE EFFECTS: Among the more serious adverse effects are hypotension, peripheral edema, AV block, bradycardia, congestive heart failure, pulmonary edema, constipation, and dizziness.

Veratrum /vərā′trəm/ [L, hellebore], a genus of poisonous herbs of the lily family. The dried rhizomes of the British and American hellebore provide alkaloids that may be used with great caution in herbalism.

verbal aphasia. See **motor aphasia.**

verbal language /vur′bəl/ [L, *verbum,* a word, *lingua,* tongue], a culturally organized system of vocal sounds that communicates meaning between individuals.

Verdeso, a trademark for **desonide.**

Veregen, a trademark for **kunecatechins.**

vergence /vur′jəns/, movement of the eyes in opposite directions (convergence and divergence).

vergence ability. See **amplitude of convergence.**

-verine, suffix for spasmolytics having a papaverine-like action.

vermes. See **vermis.**

vermicide /vur′misīd/ [L, *vermis,* worm, *caedere,* to kill], an agent that kills worms, particularly those in the intestine. Compare **anthelmintic, vermifuge.**

vermicular /vərmik′yələr/ [L, *vermis,* worm], resembling a worm.

vermicular pulse, a small, rapid pulse that feels like a writhing worm when palpated.

vermiform /vur′mifôrm/ [L, *vermis,* worm, *forma,* form], resembling a worm. Also **lumbrical.**

vermiform appendix [L, *vermis* + *forma,* form, *appendix,* appendage], a wormlike blunt process extending from the cecum. Its length varies from 7 to 15 cm, and its diameter is about 1 cm. Also called **appendix vermiformis, cecal appendix, mesoappendix.** See also **appendicitis.**

vermifuge /vərmifyo͞oj′/ [L, *vermis* + *fugare,* to chase away], an agent that causes the evacuation of intestinal parasitic worms.

vermilion border /vərmil′yən/ [L, *vermillium,* bright red; OFr, *bordure,* frame], the external pinkish-to-red area of the upper and lower lips. It extends from the junction of the lips with the surrounding facial skin on the exterior to the labial mucosa within the mouth.

vermin /vur′min/ [L, *vermis,* worm], any parasitic insect or small animal, such as a louse, bedbug, mouse or rat, regarded as a destructive or disease-carrying pest.

vermis /vur′mis/ *pl.* **vermes** [L], **1.** a worm. **2.** a structure resembling a worm, such as the median lobe of the cerebellum. **—vermiform,** *adj.*

vermis cerebelli /vər′mis ser′ə·bel′ī/ [L, worm of cerebellum], the narrow median part of the cerebellum, between the two lateral hemispheres. The cranial or superior portion extends from the lingula to the folium vermis, and the inferior or caudal portion from the tuber vermis to the nodulus. Also called *vermis of cerebellum.*

Vermox, a trademark for an anthelmintic **(mebendazole).**

vernal conjunctivitis /vur′nəl/ [L, *vernare,* springlike, *conjunctivus,* connecting; Gk, *itis,* inflammation], a chronic, bilateral inflammation of the conjunctiva, thought to be allergic in origin, that occurs most frequently in men under 20 years of age during the spring and summer. The most common symptoms include intense itching and a crusting discharge. Topical corticosteroids may be applied, and desensitization to pollen may be helpful. Compare **allergic conjunctivitis.**

vernal keratoconjunctivitis, an ocular inflammatory disease caused by allergic reaction, often occurring in the spring but sometimes year-round. It is characterized by the presence of cobblestonelike bumps on the upper eyelid. There may also be swelling and thickening of the conjunctiva, a mucus discharge, itching, and sensitivity to light.

Verner-Morrison syndrome, a rare syndrome of profuse watery diarrhea, hypokalemia, and achlorhydria, usually associated with excess levels of vasoactive intestinal polypeptide resulting from a tumor (VIPoma) in the pancreas. Also called **pancreatic diarrhea.**

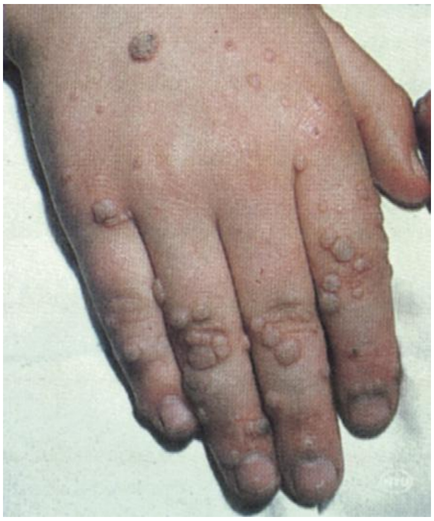
Vernet's syndrome /vernāz′/ [Maurice Vernet, French neurologist, b. 1887–1974], a neurological disorder caused by injury to the ninth, tenth, and eleventh cranial nerves as they pass through the jugular foramen when leaving the skull. Often associated with vascular neoplasms or carotid dissections or aneurysms. Symptoms include unilateral flaccid paralysis of the palatal, pharyngeal, and intrinsic laryngeal muscles and the sternocleidomastoid and trapezius muscles. The patient also experiences dysphagia, a nasal and hoarse voice, and, occasionally, some loss of taste sensations. Also called **jugular foramen syndrome.**

Verneuil's neuroma. See **plexiform neuroma.**

vernix caseosa /vur′niks kas′ē·ō′sə/ [Gk, resin; L, *caseus,* cheese], a grayish-white cheeselike substance, consisting of sebaceous gland secretions, lanugo, and desquamated epithelial cells, that covers the skin of the fetus and newborn. It acts as a protective agent during intrauterine life and is thought to have an insulating effect against heat loss.

verocytotoxin /ver′ō·sī′tō·tok′sin/, either of two toxins found in certain strains of *Shigella dysenteriae* and *Escherichia coli,* causing a type of hemolytic uremic syndrome. Humans are infected by ingesting undercooked meat, unpasteurized milk, and foods contaminated with cattle feces.

verruca /vəro͞o′kə/ *pl. verrucae* [L, wart], a benign, viral, warty skin lesion with a rough, papillomatous surface. It is



Verruca *(Courtesy American Academy of Dermatology and Institute for Dermatologic Communication and Education, Schaumburg, Illinois)* caused by a common contagious papovavirus. Methods of treatment include salicylic acid, cantharidin, electrodesiccation, curette excision, laser excision, and liquid nitrogen. Also called **verruca vulgaris, wart. —verrucose, verrucous,** *adj.*

verruca acuminata. See **genital wart.**

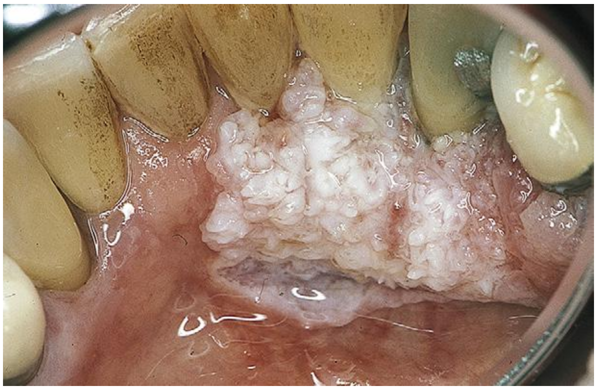
verruca plana, a small, slightly elevated, smooth, tan or flesh-colored wart, sometimes occurring in large numbers on the face, neck, back of the hands, wrists, and knees, especially in children. Also called **flat wart.**

verruca senilis. See **basal cell papilloma.**

verruca vulgaris, a common wart. See **verruca.**

verrucose, verrucous, the presence of warts. See **verruca.**

verrucous carcinoma /vəro͞o′kəs/, a well-differentiated squamous cell neoplasm of soft tissue of the oral cavity, larynx, or genitalia. A slow-growing tumor with displacement of surrounding tissue, rather than invasion or metastasis, occurs.



Verrucous carcinoma *(Regezi, Sciubba, and Pogrel, 2000)*

verrucous dermatitis, any skin rash with wartlike lesions.

verrucous endocarditis [L, *verruca,* wart; Gk, *endon,* within, *kardia,* heart, *itis,* inflammation], a form of heart inflammation characterized by the development of wartlike growths on the heart valves.

verruga peruana. See **bartonellosis.**

-verse, **1.** suffix meaning "to turn": *reverse, sacrotransverse, transverse.* **2.** suffix meaning "turned, changed": *inverse, reverse.*

Versed, a trademark for a parenteral central nervous system depressant **(midazolam hydrochloride).**

version /vur′zhən/ [L, *vertere,* to turn], the changing of the fetal position in the uterus, usually done to facilitate delivery. Version may occur spontaneously as a result of uterine contractions or be performed by internal or external manipulation by the physician.

version and extraction, an obstetric operation in which a fetus presenting head first is turned and delivered feet first. It is performed by reaching deeply into the uterus, grasping the feet and pulling them down, and extracting the infant. The procedure is considered outmoded and hazardous and has been replaced by cesarean section, although it still may be done to deliver a second twin. Also called **internal podalic version, total breech extraction.** Compare **external version.** See also **breech birth.**

-vert, suffix meaning a "person who has turned (metaphorically)" in a specified direction: *extrovert, introvert, invert.*

vertebra /vur′təbrə/ *pl. vertebrae* [L, joint], any one of the 33 bones (26 in the adult) of the spinal column, comprising the 7 cervical, 12 thoracic, 5 lumbar, 5 sacral (1 in adult), and 4 coccygeal vertebrae (1 in adult). The vertebrae, with the exception of the first and second cervical vertebrae, are much alike and are composed of a body, an arch, a spinous process for muscle attachment, and pairs of pedicles and processes. The first cervical vertebra is called the atlas and has no vertebral body. The second cervical vertebra is called the axis and forms the pivot on which the atlas rotates, permitting the head to turn. The body of the axis also extends into a strong, bony process (the dens).

vertebral /vur′təbrəl/ [L, *vertebra,* joint], pertaining to one or more vertebrae.

-vertebral, suffix meaning "spinal column": *paravertebral, pelvivertebral, subvertebral.*

vertebral angiography [L, *vertebra* + Gk, *angeion* + *graphein,* to record], the radiographic examination of blood circulation in the spinal area after the injection of radiopaque contrast medium. See **angiography.**

vertebral arch [L, *vertebra,* joint, *arcus,* bow], the arch formed on the back of the vertebral body by the pedicles and laminae.

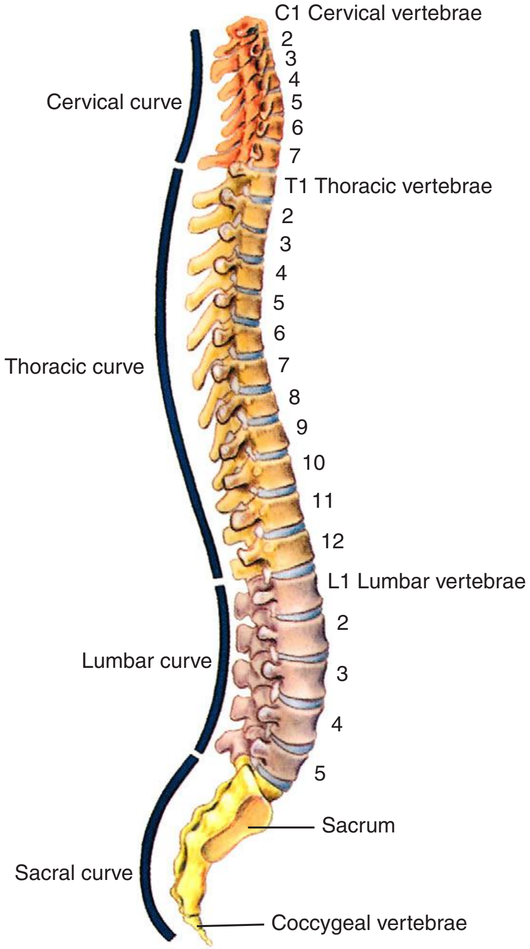
vertebral artery, one of a pair of arteries branching from the subclavian arteries, arising deep in the neck from the cranial and dorsal subclavian surfaces. Each vertebral artery divides into two cervical and five cranial branches, supplying deep neck muscles, the spinal cord and spinal membranes, and the cerebellum.

vertebral-basilar system, an arterial complex in which two vertebral arteries join at the base of the skull to form the basilar artery.

vertebral body, the weight-supporting, solid central part of a vertebra. The pedicles of the arch project from its dorsolateral surfaces.

vertebral canal [L, *vertebra,* joint, *canalis*], the passage formed anterior to the vertebral arches and posterior to the vertebral bodies and occupied by the spinal cord. The vertebral canal courses within the vertebral column and contains the spinal cord. The canal is formed by the posterior arches of the vertebrae and is large and triangular in the cervical and lumbar sections of the column, the most flexible parts. The canal is small and rounded in the thoracic region, where motion is more restricted.

vertebral column, the flexible structure that forms the longitudinal axis of the skeleton. In the adult it includes 26 vertebrae arranged in a straight line from the base of the skull to the coccyx. The vertebrae are separated by intervertebral disks. They provide attachment for various muscles such as the iliocostalis thoracis and the longissimus thoracis that give the column strength and flexibility. In the adult the five sacral and four coccygeal vertebrae fuse to form the sacrum and the coccyx. The average length of the vertebral column in men is about 71 cm. The cervical part measures about 12.5 cm, the thoracic part about 28 cm, the lumbar part about 18 cm, and the sacrum and the coccyx about 12.5 cm. The vertebral column in women measures approximately 61 cm. Several curves in the column increase its strength, such as the cervical, thoracic, lumbar, and pelvic curves. The cervical curve is convex ventrally from the apex of the dens to the middle of the second thoracic vertebra and is the least marked of all the curves. The thoracic curve, concave ventrally, starts at the middle of the second and ends at the middle of the twelfth thoracic vertebra. The lumbar curve, more pronounced in women than in men, begins at the middle of the last thoracic vertebra and ends at the sacrovertebral angle. The pelvic curve starts at the sacrovertebral articulation and ends at the point of the coccyx. The thoracic and the sacral curves constitute primary curves, present during fetal life; the cervical and lumbar curves constitute secondary curves, which develop after birth. Also called **spinal column, spine.** See also **vertebra, vertebral canal.**



Vertebral column: right lateral view *(Applegate, 2011)*

vertebral foramen [L, *vertebra,* joint, *foramen,* a hole], the opening between the neural arch and the body of a vertebra through which the spinal cord passes.

vertebral groove [L, *vertebra,* joint; D, *groeve*], a shallow depression on each side of the spinous processes of the vertebrae, occupied by the deep back muscles.

vertebral notch [L, *vertebra,* joint; OFr, *enochier,* notch], either of the concavities on the lower or upper border of a vertebral pedicle.

vertebral rib, one of two lower ribs on either side that are not attached anteriorly. Also called **floating rib.** See also **rib.**

vertebral subluxation complex, in chiropractic, malfunction of organs or tissue caused by impairment of nerve function that results from restriction of normal motion or from abnormal position of spinal segments.

vertebral-venous system, a group of four interconnected venous networks surrounding the vertebral column.

vertebrate [L, *vertebra,* joint], any animal that possesses a backbone and thus is a member of the subphylum Vertebrata of the phylum Chordata. Vertebrates include fish, amphibians, birds, reptiles, and mammals.

vertebro-, prefix meaning "vertebral column or vertebra": *vertebrocostal, vertebrodymus, vertebrosternal.*

vertebrochondral /vur′təbrōkon′drəl/, pertaining to a vertebra and a costal cartilage.

vertebrocostal /-kos′təl/, pertaining to a vertebra and a rib, or a vertebra and a costal cartilage.

vertebrocostal rib, one of the eighth, ninth, and tenth ribs on either side that articulate posteriorly with the vertebrae and have their costal cartilages connected anteriorly by capsular ligaments. Also called **false rib.** See also **rib.**

vertebrosternal rib /-stur′nəl/, one of the seven upper ribs on either side that have cartilage articulating directly with the sternum. Also called **true rib.** See also **rib.**

verteporfin /ver′tĕ-por′fin/, a photosensitizing agent that accumulates preferentially in neovasculature, including that in the choroid, such as occurs in age-related macular degeneration, ocular histoplasmosis, or pathological myopia. The agent is then activated by light of a specific wavelength in the presence of oxygen and causes local damage to the neovascular endothelium followed by vessel occlusion. It is administered intravenously before irradiation of the lesion with light from a compatible laser.

vertex /vur′teks/ [L, summit], **1.** the top of the head; crown. **2.** the apex or highest point of any structure.

vertex presentation, (in obstetrics) a fetal presentation in which the vertex of the fetus is the part nearest to the cervical os and can be expected to be born first. Compare **breech presentation.**

vertical /vur′tikəl/ [L, *vertex,* summit], perpendicular or at a right angle to the plane of the horizon.

vertical angulation [L, *vertex* + *angulus,* corner], the angle within the vertical plane, relative to a reference in the horizontal or occlusal plane, at which the central x-ray beam is directed during radiography or dental imaging of oral structures. Compare **horizontal angulation.**

vertical coordination, a system of community health nurses who serve as links between their level in the organization and those above and below their level. They also serve as links between the agency and the patient.

vertical diplopia [L, *vertex* + Gk, *diploos,* double, *opsis,* vision], a form of double vision in which one image is displaced vertically above the other.

vertically-integrated health care, a health delivery system in which the complete spectrum of care, including financial services, is provided within a single organization, such as a health maintenance organization.

vertical nystagmus, a visual abnormality in which the eyes involuntarily move up and down.

vertical plane. See **cardinal frontal plane.**

vertical resorption, a pattern of bone loss in which the alveolar bone adjacent to an affected tooth is destroyed without simultaneous crestal loss. See also **resorption.**

vertical squint. See **vertical strabismus.**

vertical strabismus [L, *vertex* + Gk, *strabismos,* squint], a deviation of one eye in a vertical direction from a point of fixation. A common cause is overaction by the inferior oblique muscles or a weakness of the superior oblique muscle, resulting in a quick vertical movement of the eyeball on adduction. Also called **upward-and-downward squint, vertical squint.**

vertical transmission, the transfer of a disease, condition, or trait from one generation to the next either genetically or congenitally, such as the spread of an infection through breast milk or through the placenta.

vertical vertigo, a sense of instability caused by looking up or down.

verticosubmental /vur′tikō′submen′təl/ [L, *vertex* + *sub,* below, *mentum,* chin], pertaining to a radiographic projection of the head in which the central ray passes from the vertex of the skull through its base.

vertigo /vur′tigō, vurtī′gō/, a sensation of instability, giddiness, loss of equilibrium, or rotation, caused by a disturbance in the semicircular canal of the inner ear or the vestibular nuclei of the brainstem. The sensation that one's body is rotating in space is called subjective vertigo, whereas the sensation that objects are spinning around the body is termed objective vertigo. See also **dizziness, postural vertigo, vestibular neuronitis.**

very low–density lipoprotein (VLDL), a plasma lipoprotein that is composed chiefly of triglycerides, with small amounts of cholesterol, phospholipid, fat-soluble vitamins, and protein. It transports triglycerides primarily from the liver to peripheral sites in the tissues for use or storage. The triglycerides are quickly converted to smaller, more soluble intermediate lipoproteins and eventually to low-density lipoproteins. Elevations in VLDL are associated with increased risk of atherosclerosis. See also **high-density lipoprotein, low-density lipoprotein.**

vesical /ves′ikəl/ [L, *vesica,* bladder], pertaining to a fluid-filled sac, usually the urinary bladder.

vesical calculus, a calculus found in the urinary bladder. Also called **bladder calculus, bladder stone, cystolith.**

vesical fistula [L, *vesica,* bladder, *fistula,* pipe], an abnormal passage communicating with the urinary bladder. Vesical fistulae may communicate with the skin, vagina, uterus, or rectum.

vesical glands, mucous glands sometimes found in the wall of the urinary bladder, especially in the area of the trigone.

vesical hematuria [L, *vesica,* bladder; Gk, *haima,* blood + *ouron,* urine], the presence of blood in the urine caused by bleeding in the bladder. The urine is bright red.

vesical lithotomy. See **cystolithotomy.**

vesical reflex, the sensation of a need to urinate when the bladder is moderately distended. See also **micturition reflex.**

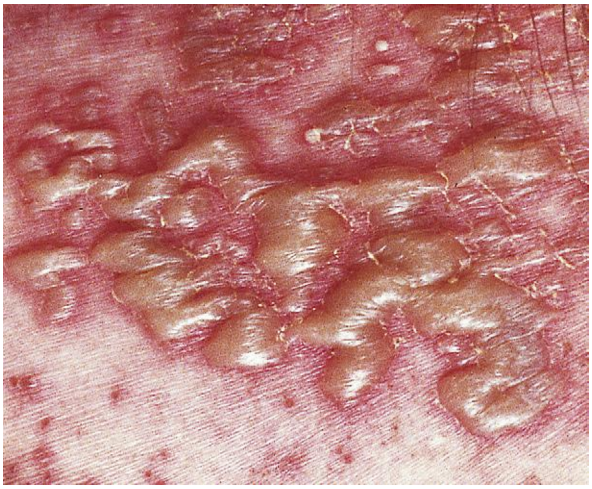
vesical sphincter, a circular muscle surrounding the opening of the urinary bladder. It is normally contracted to prevent leakage from the bladder.

vesicant /ves′ikənt/, a drug capable of causing tissue necrosis when extravasated.

vesicants. See **blister agents/vesicants.**

VESIcare, a trademark for **solifenacin.**

vesicle /ves′ikəl/ [L, *vesicula*], a small bladder or blister, containing clear fluid. Compare **bulla.** **—vesicular,** *adj.*



Vesicles *(du Vivier, 2002)*

vesico-, combining form meaning "bladder or blister": *vesicocavernous, vesicosigmoid, vesicourethral.*

vesicoabdominal /ves′ikō·abdom′inəl/, pertaining to the urinary bladder and abdominal wall.

vesicocele. See **cystocele.**

vesicocolonic fistula. See **colovesical fistula**.

vesicoenteric fistula, enterovesical fistula. Also called **vesicointestinal fistula.**

vesicosphincter dyssynergia. See **detrusor-sphincter dyssynergia.**

vesicoureteral reflux /ves′ikōyo͝orē′tərəl/ [L, *vesica* + Gk, *oureter,* ureter; L, *refluxus,* backflow], an abnormal backflow of urine from the bladder to the ureter, resulting from a congenital defect, obstruction of the outlet of the bladder, or edema or scarring secondary to infection of the lower urinary tract. Reflux increases the hydrostatic pressure in the ureters and kidneys and may cause permanent damage. The condition is characterized by abdominal or flank pain, enuresis, pyuria, hematuria, proteinuria, and bacteriuria accompanied by persistent or recurrent urinary tract infections. Diagnosis is made by cystoscopy and voiding cystourethrography. Obstruction of the ureter or defective implantation of the ureter in the bladder may be surgically corrected. Antibacterial medication, urinary tract antiseptics, and analgesia are usually prescribed for any infection that causes or results from this condition.

vesicouterine /ves′ikōyo͞o′tərin, -ēn/ [L, *vesica* + *uterus,* womb], pertaining to the bladder and uterus. Also called **uterovesical.**

vesicouterine pouch, a shallow pouch that occurs anteriorly between the bladder and uterus.

vesicovaginal /ves′ikōvaj′inəl/, pertaining to the urinary bladder and vagina.

vesicovaginal fistula, a fistula between the bladder and the vagina.

vesicula /vəsik′yələ/ [L], a vesicle or small bladder.

vesicular /vesik′yələr/, pertaining to a blisterlike condition.

vesicular appendix, a cystic structure on the fimbriated end of each of the fallopian tubes. It represents a remnant of the mesonephric ducts.

vesicular breath sound (V.S.), a normal sound of rustling or swishing heard with a stethoscope over the lung periphery. It characteristically has a higher pitch during inspiration and fades rapidly during expiration. Compare **bronchial breath sound.**

vesicular emphysema. See **panacinar emphysema.**

vesicular mole. See **hydatid mole.**

vesicular ovarian follicle, graafian follicle.

vesiculitis /vəsik′yəlī′tis/, an inflammation of any vesicle, particularly a seminal vesicle. Clinical manifestations of this condition are minimal; it is usually associated with prostatitis.

vesiculography /vəsik′yəlog′rəfē/, the radiological examination of the seminal vesicles and adjacent structures, usually after injection of a radiopaque contrast medium into the deferent ducts or, by catheterization, into the ejaculatory ducts. The technique is used to examine the seminal vesicles, vas deferens, and ejaculatory duct for possible tumors, cysts, or other disorders.

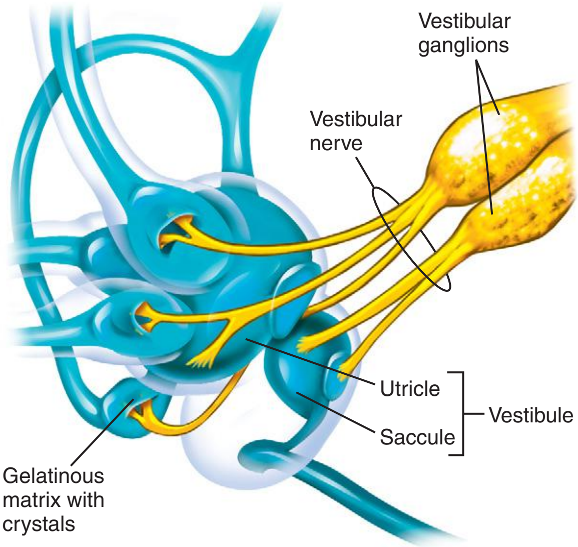
vesiculotympanitic, both vesicular and tympanitic; said of auscultatory sounds.

vespid, a wasp. See **bee sting**

vessel /ves′əl/ [L, *vascellum,* small vase], any one of the many tubules throughout the body conveying fluids, such as blood and lymph. The main kinds of vessels are the arteries, veins, and lymphatic vessels.

vestibular /vestib′yələr/ [L, *vestibulum,* courtyard], pertaining to a vestibule, such as the vestibular part of the mouth, which lies between the cheeks and the teeth.

vestibular apparatus, the inner ear structures that are associated with balance and position sense. They include the vestibule and semicircular canals.



Vestibular apparatus

vestibular caecum of cochlear duct, a small blind outpouching at the vestibular end of the cochlear duct.

vestibular extension, oral surgery. See **vestibuloplasty.**

vestibular fold. See **false vocal cord.**

vestibular fossa, the vaginal vestibule between the vaginal orifice and the fourchette (frenulum of pudendal labia). Also called **fossa of vestibule of vagina,** *navicular fossa*.

vestibular function, the sense of balance.

vestibular gland, any one of four small glands, two on each side of the vaginal orifice. One pair of the small structures constitutes the greater vestibular glands; the other pair constitutes the lesser vestibular glands. The vestibular glands secrete a lubricating substance. Compare **Cowper's gland.** See also **Bartholin's gland.**

vestibular nerve [L, *vestibulum,* courtyard, *nervus*], a branch of the eighth cranial nerve associated with the sense of equilibrium. It arises in the vestibular ganglion (Scarpa's ganglion) of the ear.

vestibular neuronitis, a sudden, severe attack of vertigo without symptoms of deafness or tinnitus. It usually affects young or middle-aged adults, is temporary, and follows an upper respiratory infection.

vestibular surface, the surface of a tooth that is directed outward toward the vestibule of the mouth, including the buccal and labial surfaces, and opposite the lingual (or oral) surface.

vestibular toxicity, toxic effects (commonly of drugs) on the vestibule of the ear, resulting in dizziness, vertigo, and loss of balance.

vestibular window. See **oval window.**

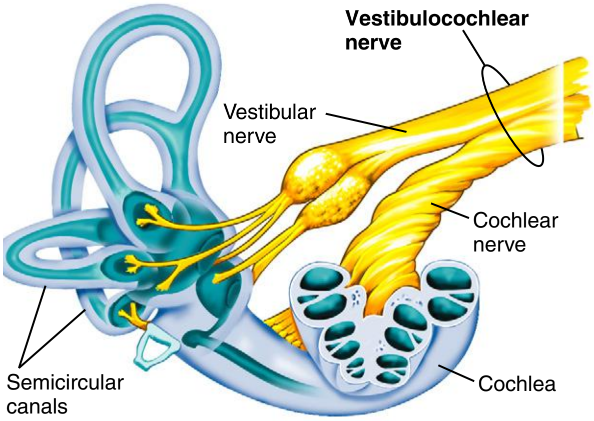
vestibule /ves′tibyo͞ol/ [L, *vestibulum,* courtyard], a space or a cavity that serves as the entrance to a passageway, such as the vestibule of the vagina or the vestibule of the ear.

vestibule of the aorta, a space within the left ventricle of the heart at the root of the aorta.

vestibule of the ear, the central part of the inner ear, within the osseous labyrinth, involved with the sensation of position and movement.

vestibule of the mouth, the portion of the oral cavity bounded on one side by the teeth and gingivae, or the residual alveolar ridges, and on the other side by the lips (labial vestibule) and cheeks (buccal vestibule).

vestibulocochlear nerve, either of a pair of cranial nerves composed of fibers from the cochlear nerve and the vestibular nerve in the inner ear, conveying impulses of both the sense of hearing and the sense of balance. Also called **acoustic nerve, eighth cranial nerve.**



Vestibulocochlear nerve

vestibulo-ocular reflex /vestib′yəlō·ok′yələr/, a normal reflex in which eye position compensates for movement of the head. It is induced by excitation of the vestibular apparatus.

vestibuloplasty /vestib′yəlōplas′tē/ [L, *vestibulum,* courtyard; Gk, *plassein,* to shape], plastic surgery of the oral vestibule, particularly modification of the gingival and mucosal tissues to create a deeper or better shaped vestibule usually to aid in the creation of a supporting area. See **supporting area** and **stress-bearing area.** Also called **sulcoplasty, vestibular extension.**

vestige /ves′tij/ [L, *vestigium,* trace], an imperfectly developed, relatively useless organ or other structure of the body that had a vital function at an earlier stage of life or in a more primitive form of life. The vermiform appendix is a vestigial organ. —*vestigial, adj.*

veterinarian /vet′əriner′ē·ən/ [L, *veterinarius,* beast of burden], a health professional who specializes in the causes and treatment of diseases and disorders of domestic and wild animals.

veterinary medicine /vet′əriner′ē/, the field of medicine concerned with the health and diseases of animals other than humans.

VF, **1.** abbreviation for **ventricular fibrillation. 2.** abbreviation for **visual field. 3.** abbreviation for **vocal fremitus.**

VH, abbreviation for **viral hepatitis.**

VI, abbreviation for *variable interval*. See **variable interval reinforcement.**

via /vī′ə, vē′ä/ [L, a way], any passage or course, such as the esophagus or trachea.

viability /vī′əbil′itē/ [L, *vita,* life], the ability to continue living.

viable /vī′əbəl/ [Fr, likely to live], capable of developing, growing, and otherwise sustaining life, such as a normal human fetus at 24 weeks of gestation. —**viability,** *n.*

viable infant, an infant who at birth weighs at least 500 g or is 24 weeks or more of gestational age.

Viagra /vi-ag′rah/, a trademark for a preparation of sildenafil citrate, a treatment for erectile dysfunction.

vial /vī′əl/, a glass container with a metal-enclosed rubber seal.

Vibramycin Monohydrate, a trademark for a tetracycline antibiotic (doxycycline monohydrate).

vibrating. See **cupping and vibrating.**

vibration /vībrā′shən/ [L, *vibrare,* to vibrate], a type of massage administered by quickly tapping with the fingertips or alternating the fingers in a rhythmic manner or by a mechanical device. See also **massage.**

vibratory /vī′brətôr′ē/ [L, *vibrare,* to vibrate], causing vibrations or a state of vibration.

vibratory massage, the manipulation of body surfaces with an instrument that produces a rapid tapping sensation. Also called **vibrotherapeutics.**

vibratory sense [L, *vibrare,* to vibrate, *sentire,* to feel], the ability to perceive vibratory sensations. Vibration receptors in the body are found in a variety of locations, from the skin surface to the membranes covering bones. Some respond only to certain vibration frequencies.

vibrio /vib′rē·ō/ [L, *vibrare*], any bacterium that is curved and motile, such as those belonging to the genus *Vibrio*. Cholera and several other epidemic forms of gastroenteritis are caused by members of the genus.

Vibrio cholerae, the species of comma-shaped, motile bacillus that is the cause of cholera.

Vibrio fetus. See ***Campylobacter.***

vibrio gastroenteritis, an infectious disease caused by ***Vibrio parahaemolyticus*** acquired from contaminated seafood. It is characterized by nausea, vomiting, abdominal pain, and diarrhea. Headache, mild fever, and bloody stools also may be present. Spontaneous recovery usually occurs in 2 to 5 days. Compare **salmonellosis, shigellosis.**

Vibrio parahaemolyticus /per′əhē′mōlit′ikəs/, a species of halophic (salt-tolerant) microorganisms of the genus *Vibrio,* found in brackish water. It is the causative agent in food poisoning associated with the ingestion of raw or undercooked shellfish, especially crabs and shrimp. This microorganism is a common cause of gastroenteritis in Japan, aboard cruise ships, and in the eastern and southeastern coastal areas of the United States. Thorough cooking of seafood prevents the infection associated with *Vibrio parahaemolyticus,* which causes watery diarrhea, abdominal cramps, vomiting, headache, chills, and fever. This microorganism has an incubation period of 2 to 48 hours, after which the symptoms of infection appear. The food poisoning from this agent usually subsides spontaneously within 2 days but may be more severe, even fatal, in debilitated and elderly people. This organism can also cause infection of the skin when an open wound is exposed to seawater. Confirming diagnosis must rule out other causes of food poisoning and acute GI disorders and requires bacteriological examination of the vomitus, stool, and blood. Treatment usually includes bed rest and the oral replacement of fluids. IV replacement of fluids is seldom required.

Vibrio vulnificus, a halophilic (salt-tolerant) species of microorganism whose strains are similar to *V. parahaemolyticus* but differ in that they can ferment lactose. Infection by eating raw seafood causes septicemia, gastroenteritis, and cellulitis, and may be especially severe or even fatal in those with preexisting hepatic disease. Wound infection may occur following exposure to sea water or from injury when handling crabs.

vibrotherapeutics. See **vibratory massage.**

vicarious menstruation /vīker′ē·əs/ [L, *vicarius,* substituted, *menstruare,* to menstruate], discharge of blood from a site other than the uterus at the time when the menstrual flow is normally expected. Such bleeding is usually caused by the increased capillary permeability that occurs during menstruation.

vidarabine /vider′əbēn/, an antiviral agent. Also called **adenine arabinoside.**

■ INDICATIONS: This drug is an ophthalmic ointment prescribed to treat keratoconjunctivitis and nearby epithelial or superficial keratitis caused by herpes simplex virus type 1 or type 2.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use, and it should not be used for ophthalmic ulcers that are sterile.

■ ADVERSE EFFECTS: Local irritation, photophobia, and corneal edema may occur in topical ophthalmic applications.

Vidaza, a trademark for **azacitidine.**

videoconference /vid′e-o-con′fer-ens/, a conference between persons in different locations by means of computerized audiovisual displays.

video display terminal (VDT) [L, *videre,* to see, *displicare,* to scatter, *terminus,* end], a cathode-ray tube device with a surface similar to a television screen, used in word processors, computer terminals, and similar equipment. Use of video display terminals has been associated with a variety of environmental health complaints, including burning and itching eyes, headaches, and back and arm pain. Published studies indicate that the health effects are caused by inadequate or improper office environments, such as unsuitable furniture or light levels, rather than VDT radiation.

videoendoscopy /vid′e-o-en-dos′kah-pe/, endoscopy performed under the guidance of a video camera in the tip of the endoscope.

videolaparoscopy /vid′e-o-lap′ah-ros′kah-pe/, laparoscopic surgery performed under the guidance of a video camera in the tip of the laparoscope.

videostroboscopy, an endoscopic examination of the larynx while speaking.

Videx, a trademark for an antiretroviral acquired immunodeficiency syndrome drug **(dideoxyinosine [ddI]).**

view /vu/, projection.

vigilambulism /vij′ilam′byəliz′əm/, a condition in which walking or other motor acts are performed in an unconscious but waking state.

vigilance /vij′iləns/ [L, *vigil,* awake], a state of being attentive or alert.

vigil coma /vij′əl/ [L, *vigil* + Gk, *koma,* deep sleep], a semiconscious state of delirium in which the patient may appear awake, with eyes open and staring, and may make verbal sounds.

vignetting, the peripheral reduction of light intensity in fluoroscopic image intensifiers.

villi. See **villus.**

villoma /vilō′mə/ *pl. villomas, villomata* [L, *villus,* hair; Gk, *oma,* tumor], a villous neoplasm or papilloma occurring in the bladder or rectum. Also called *villioma*.

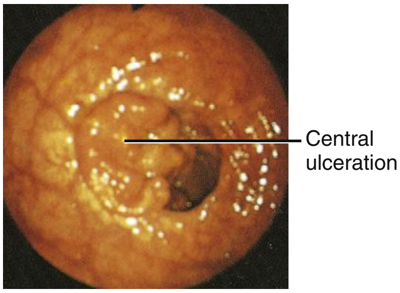
villous. See **villus.**

villous adenoma /vil′əs/ [L, *villus,* hair], a slow-growing, soft, spongy, potentially malignant papillary growth of the mucosa of the large intestine.

villous carcinoma, an epithelial tumor with many long velvety papillary outgrowths. Also called **carcinoma villosum.**

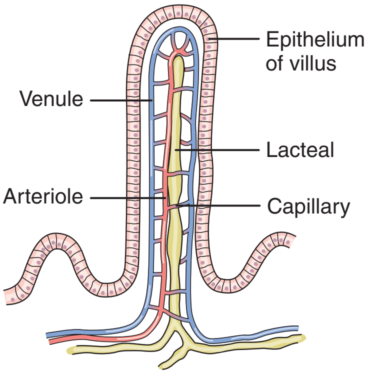
villous chorion, the region of the chorion that bears villi. Also called **shaggy chorion.**

villous papilloma, a benign tumor with long, slender processes, usually occurring in the bladder, breast, or a cerebral ventricle.



Villous adenoma: endoscopic view
(Skarin, 2010)

villus /vil′əs/ *pl*. **villi** [L, shaggy, hair], one of the many tiny projections, barely visible to the naked eye, clustered over the entire mucous surface of the small intestine. Villi are covered with epithelium that diffuses and transports fluids and nutrients. They are larger in some parts of the intestine than in others and flatten out when the intestine distends. Each villus has a core of delicate areolar and reticular connective tissue supporting the epithelium, various capillaries, and often a single lymphatic lacteal that fills with milky white chyle during the digestion of a fatty meal. **—villous,** *adj*.



Villus *(Phipps et al, 2003)*

vin-, -vin, combining form for antiviral substances.

vinBLAStine sulfate /vinblas′tēn, -tin/, an antimitotic antineoplastic.

■ INDICATIONS: It is prescribed in the treatment of many neoplastic diseases, such as choriocarcinoma, testicular carcinoma, lung cancer, breast cancer, renal cancer, Hodgkin's disease, and non-Hodgkin's lymphoma.

■ CONTRAINDICATIONS: Leukopenia, bacterial infection, or known hypersensitivity to this drug prohibits its use. It is not prescribed in pregnancy and should not be administered intrathecally.

■ ADVERSE EFFECTS: Among the typical adverse effects are leukopenia (dose-limiting toxicity), nausea, diarrhea, stomatitis, and alopecia. Neurotoxicity seldom occurs at usual clinical doses but can become significant at higher doses. VinBLAStine is a vesicant, so prompt attention is required if extravasation occurs.

Vincent's angina, Vincent's infection. See **acute necrotizing ulcerative gingivitis.**

Vincent's stomatitis [Henri Vincent, French physician, 1862–1950; Gk, *stoma,* mouth, *itis,* inflammation], a painful bacterial infection of the mouth and gums causing ulceration (gingivitis). See **acute necrotizing ulcerative gingivitis.**

vinCRIStine sulfate /vinkris′tēn, -tin/, an antimitotic antineoplastic.

■ INDICATIONS: It is prescribed in the treatment of many neoplastic diseases, such as leukemia, neuroblastoma, lymphomas, and sarcomas. It is often used in combination therapy since its dose-limiting toxicity is different from that of most other cancer chemotherapy drugs.

■ CONTRAINDICATIONS: Pregnancy, leukopenia, preexisting neuromuscular disease, or known hypersensitivity to this drug prohibits its use. Intrathecal administration of vinCRIStine has caused deaths and is therefore also contraindicated.

■ ADVERSE EFFECTS: Neurotoxicity is the dose-limiting toxicity. Constipation, abdominal pain, and alopecia also may occur. VinCRIStine is a vesicant, so prompt attention is required if extravasation occurs. Leukopenia seldom occurs at usual clinical doses but can become significant at higher doses.

Vineberg's operation /vīn′bərgs/ [Arthur M. Vineberg, Canadian thoracic surgeon, 1903–1988], a technique in which the internal mammary artery is implanted into the myocardium to improve blood flow to the heart. Common in the 1950s, the procedure has been replaced by others, such as saphenous vein grafting.

vinegar acid. See **acetic acid.**

vinorelbine tartrate, an anticancer mitotic inhibitor.

■ INDICATION: It is prescribed in the treatment of non–small cell lung cancer.

■ CONTRAINDICATIONS: It should not be given to patients with low blood counts or those who may have an allergy or sensitivity to vinorelbine. It should be used with caution in patients with comprised bone marrow; bronchospasm; or kidney, liver, or lung disease.

■ ADVERSE EFFECTS: The side effects most often reported include granulocytopenia, leukopenia, or anemia.

Viokase, a trademark for an enzyme mixture of amylase, lipase, and protease (pancrelipase) derived from hog pancreas.

violence /vi′o-lens/, great force, either physical or emotional, usually exerted to damage or otherwise abuse something or someone.

viosterol /vī·os′tərôl/, synthetic vitamin D_2 in an oil base. Also called **synthetic oleovitamin D.** See also **calciferol, ergosterol.**

VIP, **1.** abbreviation for **vasoactive intestinal polypeptide. 2.** abbreviation for *very important person*. A VIP suite in a hospital is one reserved for such people.

viperid /vi′perid /. See **viperine.**

viperine, **1.** *adj,* pertaining to the true vipers. **2.** *n,* true viper. Also called **viperid.**

VIPoma /vipō′mə/, a type of pancreatic tumor that causes changes in secretion of vasoactive intestinal polypeptide (VIP). VIP causes dilation of blood vessels throughout the body and secretion of fluid and salt in the intestinal tract, resulting in diarrhea. The VIP effects mimic the symptoms of cholera (severe diarrhea, hypokalemia, and hypochlorhydria) and can result in death from dehydration and subsequent kidney failure if treatment is not begun early. See also **vasoactive intestinal polypeptide.**

vir-, -vir, combining form for antiviral substances.

Vira-A, a trademark for an antiviral **(vidarabine).**

viraemia. See **viremia.**

viral cultures, cultures of the blood, urine, stool, throat, and skin to definitively diagnose viral disease.

viral cystitis, cystitis caused by a viral infection, most often seen in immunocompromised persons infected with BK virus.

viral disease. See **viral infection.**

viral dysentery /vī′rəl/ [L, *virus,* poison; Gk, *dys,* bad, *enteron,* intestine], a form of dysentery caused by a virus and usually characterized by an acute watery diarrhea.

viral gastroenteritis, an inflammation of the intestine caused by a virus. The symptoms usually include abdominal cramps, diarrhea, nausea, and vomiting.

viral hepatitis (VH), a viral inflammatory disease of the liver caused by one of the hepatitis viruses: A, B, C, delta, E, F, G, or H. All have chronic forms except hepatitis A. The disease is transmitted sexually and through blood transfusions and is common among people with behavior risks or human immunodeficiency virus infection. Speed of onset and probable course of the illness vary with the kind and strain of virus, but the characteristics of the disease and its treatment are the same. See also **hepatitis A, hepatitis B, hepatitis C, hepatitis D.**

■ OBSERVATIONS: Diagnosis is made through antibody (A + C) or antigen (B + D). Characteristic of viral hepatitis are anorexia, malaise, headache, pain over the liver, fever, jaundice, clay-colored stools, dark urine, nausea and vomiting, and diarrhea. Laboratory analyses reveal increased amounts of aspartate aminotransferase (AST) and bilirubin and an abnormal coagulation of the blood. Severe infection, especially with hepatitis B virus, may be prolonged and result in tissue destruction, cirrhosis, and chronic hepatitis or in hepatic coma and death.

■ INTERVENTIONS: Treatment is with alpha-interferon. Depending on the specific type of hepatitis, treatment with alpha-interferon is effective in 40% of patients with chronic hepatitis B virus infection. Improvement in liver function has been noted in 50% of the patients infected. Treatment is also largely supportive. It includes bed rest; isolation, if necessary; fluids; a low-fat, high-protein, high-calorie diet; special skin care if pruritus is present; emotional support; vitamins B_{12}, K, and C; and monitoring of liver and kidney function. Sedatives, analgesics, antiemetics, and steroids may be ordered. However, the patient is carefully observed for adverse reaction to medication because the liver may not be able to break down and detoxify the drugs. Decrease in the amount or frequency of administration or change of the medication may be necessary.

■ NURSING CONSIDERATIONS: The person is taught the importance of rest and avoiding fatigue, washing the hands carefully after urinating or defecating to avoid spreading the virus, eating well, following written dietary instructions after discharge, and avoiding alcohol, usually for at least 1 year. The patient is encouraged to have certain blood tests performed periodically, including AST and serum bilirubin, to report any symptoms of recurrence immediately, and to avoid contact with people having infections. The person is told not to donate blood and not to take over-the-counter drugs without medical consultation.

viral infection, any of the diseases caused by one of approximately 200 viruses pathogenic to humans. Some are the most communicable and dangerous diseases known; some cause mild and transient conditions that pass virtually unnoticed. If cells are damaged by the viral attack, disease exists. The signs of the infection reflect the anatomical location of the damaged cells. Viruses are introduced into the body through nonintact skin or mucous membranes or through a transfusion into the bloodstream or transplantation, by droplet infection through the respiratory tract, or by ingestion through the digestive tract into the GI system. The pathogenicity of the particular virus depends on the rapidity of replication, the enzymes released, the part of the body infected, and the particular action of the virus. After it enters the body, the virus attaches to and enters a cell. The virus directs the cell to produce new virions, using chemical building blocks and energy available in the parasitized cell. The virus has now taken over the cell. After a variable period of time, masses of fully grown viruses appear, each able to survive outside the cell until more susceptible cells are found. In poliovirus infection, one parasitized cell may produce more than 100,000 poliovirus particles in a few hours. Techniques used in viral identification and immunization are based on the essential fact that viruses can multiply only inside living cells. Inoculation of susceptible animals, tissue culture media, and chick embryos allows cultivation of viruses for study and identification and for the preparation of vaccine. Other techniques can also be used in the diagnosis of the cause of viral infection, including serological tests, fluorescent antibody microscopic examination, microscopic examination, and skin tests. In many viral diseases, including mumps, smallpox, and measles, one attack confers permanent immunity. In others, immunity is short-lived. The incubation period for viral infection is usually short, the viruses do not circulate in the bloodstream, antibodies do not form, and most often immunity does not develop. Exposure to a few viruses results in immunity to that virus and to other closely related viruses. Some vectors are able to spread several viruses, but only one at a time. Mechanisms of natural resistance to viral infection are poorly understood, but susceptibility to a particular virus is somehow species-specific; for example, chickenpox, caused by the varicella zoster virus, is seen only in humans. A protective substance, interferon, is elaborated naturally in small amounts in the body. It is cell-specific and species-specific but not virus-specific. Interferon may act as a broad spectrum antiviral agent, protecting the body from the effects of many viral infections, stopping the synthesis of viral nucleic acid within the parasitized cell. See also specific viral infections. Also called **viral disease.**

viral keratoconjunctivitis [L, *virus,* poison; Gk, *keras,* horn; L, *conjunctivus,* connecting; Gk, *itis,* inflammation], a combination of inflammation of the cornea and conjunctiva caused by a viral infection.

viral load, measurement of the amount of human immunodeficiency virus in the blood expressed as copies per milliliter. Plasma viremia is used to guide treatment decisions and monitor response to treatment. See also **viremia.**

viral meningitis, meningitis caused by various viruses, such as the coxsackieviruses, mumps virus, and the virus of lymphocytic choriomeningitis, characterized by malaise, fever, headache, nausea, cerebrospinal fluid pleocytosis (principally lymphocytic), abdominal pain, stiffness of the neck and back, and a short uncomplicated course. See also **aseptic meningitis.**

viral myocarditis, inflammation of the myocardium caused by coxsackievirus.

viral pneumonia, pulmonary infection caused by a virus.

viral therapy, the use of genetically altered viruses to deliver genes to specific sites.

Viramune, a trademark for an antiretroviral nonnucleoside analog **(nevirapine).**

Virazole, a trademark for an aerosol antiviral drug **(ribavirin).**

Virchow-Robin spaces. See **perivascular spaces.**

Virchow's node /fir′shōz/ [Rudolf L.K. Virchow, German pathologist, 1821–1902], a firm supraclavicular lymph node, particularly on the left side, that is so enlarged that it is palpable. Also called **sentinel node, signal node.**

Virchow's spaces. See **perivascular spaces.**

Viread, a trademark for an antiretroviral **(tenofovir).**

viremia /vīrē′mē·ə/ [L, *virus* + Gk, *haima,* blood], the presence of viruses in the blood. Also spelled **viraemia.** Compare **bacteremia, fungemia, parasitemia.**

virgin /vur′jən/, **1.** a person who has never had sexual intercourse. **2.** uncontaminated.

virginity /vurjin′itē/, the state of being a virgin.

virile /vir′əl/ [L, *virilis,* masculine], **1.** pertaining to or characteristic of an adult male; masculine; manly. **2.** possessing or exhibiting masculine strength, vigor, force, or energy. **3.** pertaining to the male sexual functions; capable of procreation. Compare **virilism. —virility,** *n.*

virilism /vir′əliz′əm/ [L, *virilis* + *ismus,* practice], **1.** See **virilization. 2.** pseudohermaphroditism in a female. **3.** premature development of masculine characteristics in the male. Kinds of virilism are **adrenal virilism** and **prosopopilary virilism.**

virility. See **virile.**

virilization /vir′əlīzā′shən/ [L, *virilis* + *atus,* process], a process in which secondary male sexual characteristics are acquired by a female, usually as the result of adrenal dysfunction or hormonal medication. Also called **masculinization, virilism.** See also **adrenal virilism.**

virion /vir′ē·on, vī′rē·on/ [L, *virus,* poison], a single virus particle with a central nucleoid surrounded by a protein coat or capsid. The complete nucleocapsid with a nucleic acid core may constitute a complete virus, such as the adenoviruses and the picornaviruses, or it may be surrounded by an envelope, as in the herpesviruses and the myxoviruses. Such an envelope is a membrane that contains lipids, proteins, and carbohydrates and projects spikelike structures from its surface. See also **capsid.**

virocytes /vī′rəsīts/ [L, *virus* + Gk, *kytos,* cell], lymphocytes altered in appearance and in staining that are seen in blood smears from patients with viral diseases.

viroid /vī′roid/, a small infective segment of nucleic acid, usually ribonucleic acid (RNA). It is not translated and is replicated by host cell enzymes. Viroids include segments that are complementary to introns and may bind to intron RNA. Viroids are responsible for several plant diseases. Although they have not been associated with animal diseases, viroid-like DNA has been found in cancer cells, and some authorities believe that viroids can evolve into infectious animal viruses. See also **intron, plasmid, transposon.**

virologic, virological. See **virology.**

virologist /vīrol′əjist, vir-/, a specialist who studies viruses and diseases caused by viruses.

virology /-l′əjē/ [L, *virus* + Gk, *logos,* science], the study of viruses and viral diseases. **—virologic, virological,** *adj.*

Viroptic, a trademark for an ophthalmic antiviral (trifluridine).

virtual colonoscopy, an imaging technique, used for examination of the colon, in which cross-sectional images acquired by computed tomography or magnetic resonance imaging are processed by computer to reconstruct a three-dimensional display of the colonic lumen.

virtual endoscopy, an imaging technique in which cross-sectional images acquired by computed tomography or magnetic resonance imaging are processed by computer to reconstruct a three-dimensional display similar to that seen through an endoscope.

virtual reality /vur′cho͞o·əl/, a system of computer-generated, three-dimensional, imaginary environments with which a person can subjectively interact. Examples include medical research to monitor brain activity in the hippocampus of subjects trying to solve maze problems. It is also used for simulations and gaming.

virucidal /vī′rəsī′dəl/, pertaining to the destruction of viruses.

virucide /vī′rəsīd/ [L, *virus* + *caedere,* to kill], any agent that destroys or inactivates a virus.

virulence /vir′yələns/ [L, *virulentus,* poisonous], the power of a microorganism to produce disease.

virulent /vir′yələnt/ [L, *virulentus*], pertaining to a very pathogenic or rapidly progressive condition.

virus /vī′rəs/ [L, poison], a minute parasitic microorganism much smaller than a bacterium that, having no independent metabolic activity, may replicate only within a cell of a living plant or animal host. A virus consists of a core of nucleic acid (**deoxyribonucleic acid** or **ribonucleic acid**) surrounded by a coat of antigenic protein, sometimes surrounded by an envelope of lipoprotein. The virus provides the genetic code for replication, and the host cell provides the necessary energy and raw materials. More than 200 viruses have been identified as capable of causing disease in humans. Some types of viruses are **adenovirus, arenavirus, enterovirus, herpesvirus,** and **rhinovirus.** See also **viral infection. —***viral, adj.*

virus shedding, the movement by any route of a virus from an infected host.

virustatic /vī′rəstat′ik/, pertaining to the inhibition of the growth and development of viruses, as distinguished from their destruction.

vis /vis, vēs/ [L, force], energy or power.

Visagraph /ve′zah-graf/, a trademark for a device that records and measures eye movements while the patient is reading.

viscera /vis′ərə/ *sing.* **viscus** [L, *viscus,* internal organs], the internal organs enclosed within a body cavity, including the abdominal, thoracic, pelvic, and endocrine organs.

visceral /vis′ərəl/ [L, *viscus,* internal organs], pertaining to the viscera, or internal organs in the abdominal cavity. Also **splanchnic.**

visceral abdominal fascia, the fascia that invests the abdominal viscera.

visceral afferent fibers, the nerve fibers of the visceral nervous system that receive stimuli, carry impulses toward the central nervous system, and share the sensory ganglia of the cerebrospinal nerves with the somatic sensory fibers. Peripheral distribution of the visceral afferent fibers constitutes the main difference between them and the somatic afferents. The visceral afferent fibers produce sensations different from those of the somatic afferent fibers. The visceral efferent fibers connect with both the somatic and visceral afferent fibers. The number and extent of the visceral afferent fibers is not clearly established. Their peripheral processes reach the ganglia by various routes. Most of the visceral afferent fibers accompany blood vessels for part of their course, and various afferent fibers run in the cerebrospinal nerves. Some of the parts of the body with visceral afferent fibers are the face, scalp, nose, mouth, descending colon, lungs, abdomen, and rectum. See also **autonomic nervous system.**

visceral cavity [L, *viscus,* internal organs, *cavum*], **1.** the abdominal cavity containing the viscera. **2.** the cavity of any viscus, such as the stomach.

visceral efferent system [L, *viscus,* internal organs, *effere,* to bear out; Gk, *systema*], the part of the autonomic nervous system that supplies efferent nerve fibers from the central nervous system to the visceral organs.

visceral inversion, the transposition of the abdominal and thoracic organs to opposite sides of the body. Also called **situs inversus viscerum.**

visceral larva migrans, infestation with parasitic larvae, *Toxocara,* or, occasionally, *Ascaris, Strongyloides,* or other nematodes. See also **toxocariasis.**

visceral layer of glomerular capsule, the layer of the glomerular capsule overlying the capillaries and composed of podocytes. It is separated from the parietal layer by the urinary space.

visceral leishmaniasis. See **kala-azar.**

visceral lymph node, a small oval nodular gland that filters lymph circulating in the lymphatic vessels of the thoracic, abdominal, and pelvic viscera. The visceral lymph nodes of the thorax include the anterior mediastinal nodes, posterior mediastinal nodes, and tracheobronchial nodes. The visceral lymph nodes of the abdomen and pelvis include those that follow the course of the celiac artery, superior mesenteric artery, and inferior mesenteric artery. Compare **parietal lymph node.** See also **lymph, lymphatic system, lymph node.**

visceral nervous system, the visceral part of the peripheral nervous system that comprises the whole complex of nerves, fibers, ganglia, and plexuses by which impulses travel from the central nervous system to the viscera and from the viscera to the central nervous system. It contains the usual afferent fibers that receive stimuli and carry impulses toward the central nervous system and efferent fibers that carry impulses from the appropriate centers to the active effector organs, such as the nonstriated muscle, cardiac muscle, and glands of the body. Also called **involuntary nervous system.** See also **autonomic nervous system, visceral afferent fibers.**

visceral obesity, android obesity; so-called from the theory that deep intraabdominal (visceral) fat plays a large role in the associated morbidity and mortality.

visceral pain, pain that results from the activation of nociceptors of the thoracic, pelvic, or abdominal viscera. It is felt as a poorly localized aching or cramping sensation and is often referred to cutaneous sites.

visceral pericardium [L, *viscus* + Gk, *peri,* around, *kardia,* heart], the surface of the pericardial membrane that is in direct contact with the heart. Also called **epicardium.**

visceral peritoneum, a continuation of the parietal peritoneum reflected at various places over the viscera, forming a complete covering for the stomach, spleen, liver, intestines from the distal duodenum to the upper end of the rectum, uterus, and ovaries; it also partially covers some other abdominal organs. It holds the viscera in position by its folds, including the mesenteries; the omenta; and the ligaments of the liver, spleen, stomach, kidneys, bladder, and uterus. The potential space between the visceral and the parietal peritoneum is the peritoneal cavity. The general cavity communicates by the omental foramen with the bursa omentalis (or lesser peritoneal cavity).

visceral pleura. See **pulmonary pleura.**

visceral protein status, the amount of protein that is contained in the internal organs.

visceral reflex. See **viscerosomatic reaction.**

visceral skeleton [L, *viscus* + Gk, *skeletos,* dried up], the part of the skeleton, including sternum, ribs, pelvis, and vertebrae, that encloses the viscera.

visceral swallow, an immature swallowing pattern of an infant, resembling wavelike contractions of peristalsis.

viscero-, combining form meaning "organs of the body": *viscerocranium, visceropleural, viscerosomatic.*

viscerocranium, the facial skeleton.

visceromotor /vis′ərōmō′tər/, **1.** pertaining to nerve impulses that control visceral smooth muscle. **2.** pertaining to movement of the viscera.

viscerosomatic reaction /vis′ərō′sōmat′ik/ [L, *viscus* + Gk, *soma,* body; L, *re* + *agere,* to act], a muscular response to stimulation of a nerve-receptor organ in a visceral organ. Also called **splanchnosomatic reaction, visceral reflex.**

viscoelasticity /vis′kō·ē′lastis′itē/, the quality or condition of being both viscous and elastic.

viscosity /viskos′itē/ [L, *viscosus,* sticky], the ability or inability of a fluid solution to flow easily. A solution that has high viscosity is relatively thick and flows slowly because of the adhesive effect of adjacent molecules. —*viscid, viscous, adj.*

viscous fermentation [L, *viscosus*], the formation of viscous material in milk, urine, or wine by the action of various bacilli.

viscus. See **viscera.**

visibility /vis′əbil′itē/ [L, *visibilitas,* being seen], a condition of being visible under the circumstances of light, distance, and other factors.

visible /viz′ibəl/ [L, *visibilis,* visible], perceptible to the eye.

visible light [L, *visus,* sight; AS, *leoht*], the radiant energy in the electromagnetic spectrum that is visible to the human eye. See also **visible spectrum.**

visible radiation [L, *visibilis,* vision, *radiare,* to shine], electromagnetic radiation in the wavelengths between infrared and ultraviolet that can be perceived by most normal humans.

visible spectrum [L, *visibilis,* vision, *spectrum,* image], the colors of the spectrum that can be observed by most people, from violet at about 4000 angstrom units (400 nm) through blue, green, yellow, and orange, to red, at about 6500 angstrom units (650 nm).

vision /vizh′ən/ [L, *visus,* vision], the capacity for sight.

vision compensation behavior, a nursing outcome from the Nursing Outcomes Classification defined as personal actions to compensate for visual impairment. See also **Nursing Outcomes Classification.**

vision therapy technician, an allied health professional who evaluates clients and plans and implements vision therapy programs under the supervision of an optometrist.

visit /viz′it/ [L, *visitare,* to see often], **1.** *n,* a meeting between a practitioner and a client or patient. In the hospital and the home, the practitioner makes a visit to the patient; in the clinic or office the patient makes a visit to the practitioner. **2.** *v,* (of a patient) to meet a practitioner to obtain professional services or (of a practitioner) to see a patient or client to render a professional service.

visitation facilitation, a nursing intervention from the Nursing Interventions Classification (NIC) defined as promoting beneficial visits by family and friends. See also **Nursing Interventions Classification.**

visiting nurse, a nurse who is responsible for a group of patients in a home setting, usually in a defined geographic area. The nurse makes visits to provide skilled nursing care as prescribed by a physician, particularly for persons unable to leave home for professional care, and to educate patients in matters of self-care. See also **home health nurse.**

Visken, a trademark for a beta blocker **(pindolol).**

Vistaril, a trademark for an antianxiety/antihistamine (hydroxyzine pamoate).

visual /vizh′o͞o·əl/ [L, *visus,* vision], pertaining to the sense of sight.

visual accommodation, a process by which the eye adjusts and is able to focus, producing a sharp image at various, changing distances from the object seen. The convexity of the anterior surface of the lens may be increased or decreased by contraction or relaxation of the ciliary muscle.

With increasing age the lens becomes harder and less flexible, resulting in a loss of accommodation and usually of the ability to focus on nearby objects. Compare **presbyopia.**

visual acuity [L, *visus,* vision, *acuitas,* sharpness], **1.** a measure of the resolving power of the eye, particularly with its ability to distinguish letters and numbers at a given distance. **2.** the sharpness or clearness of vision.

visual agnosia. See **object blindness.**

visual amnesia [L, *visus,* vision; Gk, *amnesia,* forgetfulness], an inability to recognize objects, including written words, previously seen.

visual angle [L, *visus,* vision, *angulus*], the angle between two lines passing from the extremities of an object looked at, through the nodal point of the eye. Also called **optic angle.**

visual aphasia [L, *visus,* vision; Gk, *a* + *phasis,* not speech], the inability to understand written language caused by a lesion in the left visual cortex and the connections between the right visual cortex and the left hemisphere.

visual center, the center of the brain concerned with vision.

visual center of the cornea, the point of intersection of the line of sight with the cornea.

visual-evoked potential (VEP), an evoked potential elicited by a repeatedly flashing light or a pattern stimulus. It may be used to confirm optic nerve or visual pathway damage.

visual field (VF), the area of physical space visible to an eye in a given position. The average VF is 65 degrees upward, 75 degrees downward, 60 degrees nasally, and 90 degrees temporally.

visual field defect, one or more spots or defects in the vision that remain constant in position, unlike a floater. This fixed defect is usually caused by damage to the retina or visual pathways, such as by retinal detachments, chorioretinitis, traumatic injury, macular degeneration, glaucoma, or a vascular occlusion of the eye or the brain. Sudden loss of a noticeable part of the visual field warrants ophthalmological examination. An Amsler grid detects defects only in the central 30°—not the entire visual field.

visual hallucinations [L, *visus,* vision, *alucinari*], a subjective visual experience in the absence of objective evidence of a corresponding stimulus. Such hallucinations are most likely to be associated with acute organic disorders such as toxic confusional psychoses, delirium, and focal brain diseases and may occur with any stage of schizophrenia.

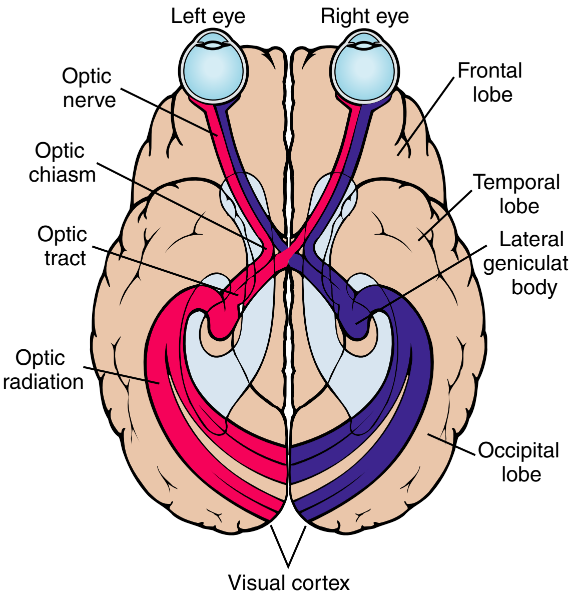
visualization /vizh′o͞o·əlīzā′shən/, an effective means of deepening relaxation and desensitizing a real-life situation that is generally met with stress and tension. The imagery combines positive experiences with actual or perceived negative events or situations in an effort to desensitize the person to the trauma. Also called **guided imagery, visual imagery.**

visual memory, the ability to create an eidetic image of past visual experiences. Also called **eye memory.**

visual-motor coordination, the ability to coordinate vision with the movements of the body or parts of the body.

visual-motor function, the ability to draw or copy forms or to perform constructive tasks.

visual pathway, a pathway over which a visual sensation is transmitted from the retina to the brain. A pathway consists of an optic nerve, the fibers of an optic nerve traveling through the optic chiasm to the lateral geniculate body of the thalamus, and optic radiations terminating in an occipital lobe. Each optic nerve contains fibers from only one retina. The optic chiasm contains fibers from the nasal parts of the retinas of both eyes; these fibers cross to the opposite side of the brain at the optic chiasm. The fibers from the temporal part of each eye do not cross at the optic chiasm, pass through the lateral geniculate body on the same side of the brain, and continue back to the occipital lobe. Thus the optic tracts, occipital lobe, lateral geniculate bodies of the thalamus, and optic chiasm each contain nerve fibers from both eyes. If the right optic tract were destroyed, a person would lose partial vision in both eyes—the right nasal and the left temporal fields of vision.



Visual pathway *(Lewis et al, 2007)*

visual plane, the plane in which the two optic axes lie.

visual purple. See **rhodopsin.**

visual response audiometry (VRA), a technique for testing the hearing of older infants and children between the ages of 12 and 30 months. Sounds such as speech and tones are presented through loudspeakers. When the child looks toward the source of the sound, he or she is rewarded by seeing a toy on top of the speaker move or light up. See also **conditioned orientation response.**

visual-spatial agnosia, an inability to analyze spatial relationships or to perform simple constructional tasks under visual control.

visuospatial /vizh′o͞o·ōspā′shəl/, pertaining to the ability to comprehend visual representations and their spatial relationships.

vita-, combining form meaning "life": *vitaglass, vital, vitascope.*

vital /vī′təl/ [L, *vita,* life], pertaining to or contributing to life forces.

vital capacity (VC) [L, *vita,* life, *capacitas,* capacity], the maximum volume of air that can be expelled at the normal rate of exhalation after a maximum inspiration, representing the greatest possible breathing capacity. The VC equals the inspiratory reserve volume plus the tidal volume plus the expiratory reserve volume. The average normal value of 4 to 5 L is affected by age, the physical dimensions of the chest cage, physical fitness, posture, and gender. The VC may be reduced by a decrease in the amount of functioning lung tissue resulting from atelectasis, edema, fibrosis, pneumonia, pulmonary resection, or tumors; by limited chest expansion resulting from ascites, chest deformity, neuromuscular disease, pneumothorax, or pregnancy; or by airway obstruction. Compare **forced expiratory volume, forced expired vital capacity, residual volume.**

vitality test /vītal′itē/, a group of thermal, transillumination, and electric tests used to evaluate the health of dental pulp. Also called **pulp test.**

vital signs[1], the measurements of pulse rate, respiration rate, and body temperature. Although not strictly a vital sign, blood pressure is also customarily included. Abnormalities of vital signs are often clues to diseases, and alterations in vital signs are used to evaluate a patient's progress. See also **blood pressure, pulse, respiration, temperature.**

Pediatric vital signs: normal ranges

Age	*Weight (kg)*	*Heart rate (average/min)*	*Respiratory rate (average/min)*
Premature	1	100-180	<40
Newborn	2-3	100-180	<40
1 mo	4	80-180	24-35
6 mo	7	70-150	24-35
1 yr	10	70-150	20-30
2-3 yr	12-14	70-120	20-30
4-5 yr	16-18	70-110	20-30
6-8 yr	20-26	60-110	12-25
10-12 yr	32-42	55-90	12-20
>14 yr	>50	55-90	12-18

From Mosby: *Mosby's PDQ for RN*, ed 2, St Louis, 2008, Mosby.

vital signs[2], a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which temperature, pulse, respiration, and blood pressure are within normal range. See also **Nursing Outcomes Classification.**

vital signs monitoring, a nursing intervention from the Nursing Interventions Classification (NIC) defined as collection and analysis of cardiovascular, respiratory, and body temperature data to determine and prevent complications. See also **Nursing Interventions Classification.**

vital stain [L, *vita,* life; OFr, *desteindre,* to dye], any dye used to impart color to tissues or cells of living organisms.

vital statistics, data relating to births or natality, deaths or mortality, marriages, health, and disease or morbidity.

vital ultraviolet (UV), the ultraviolet wavelengths between 320.0 and 290.0 nm, which are believed to be necessary or helpful for normal growth and health. Ultraviolet radiation at this wavelength converts vitamin D to its first active form.

vitamin /vī′təmin/ [L, *vita* + *amine,* ammonia], an organic compound essential in small quantities for normal physiological and metabolic functioning of the body. With few exceptions, vitamins cannot be synthesized by the body and must be obtained from the diet or dietary supplements. No one food contains all the vitamins. Vitamin deficiency diseases produce specific symptoms, usually alleviated by the administration of the appropriate vitamin. Vitamins are classified according to their fat or water solubility, their physiological effects, or their chemical structures. They are designated by alphabetic letters and chemical or other specific names. The fat-soluble vitamins are A, D, E, and K. The B complex and C vitamins are water soluble. See also **avitaminosis, hypervitaminosis, oleovitamin, provitamin,** and the specific vitamins.

vitamin A, a fat-soluble, solid terpene alcohol essential for skeletal growth, maintenance of normal mucosal epithelium, reproduction, and visual acuity. It is derived from various carotenoids, mainly beta-carotene, and is present in leafy green vegetables and yellow fruits and vegetables as a precursor and is found preformed in fish liver oils, liver, milk, cheese, butter, and egg yolk. Deficiency leads to atrophy of epithelial tissue resulting in keratomalacia, xerophthalmia, night blindness, and lessened resistance to infection of mucous membranes. Symptoms of hypervitaminosis A are irritability, fatigue, lethargy, abdominal discomfort, painful joints, severe throbbing headache, increased intracranial pressure, insomnia and restlessness, night sweats, loss of body hair, and brittle nails. Also called **antiinfection vitamin, antixerophthalmic vitamin.**

vitamin A$_1$, one of the two forms of vitamin A that occur in nature. It is a fat-soluble unsaturated alcohol formed by hydrolysis of beta-carotene, one molecule of which yields two molecules of vitamin A$_1$. Natural sources include fish-liver oils, butterfat, and egg yolk. The vitamin is needed for healthy vision and skin epithelium. Also called **retinol.**

vitamin A$_2$, an alternative form of vitamin A found in the tissues of freshwater fish but not in mammals or saltwater fish. Differences in ultraviolet light absorption spectra are used to distinguish the vitamin A forms.

vitamin B$_1$. See **thiamine.**

vitamin B$_2$. See **riboflavin.**

vitamin B$_6$. See **pyridoxine.**

vitamin B$_9$. See **folic acid.**

vitamin B$_{12}$. See **cyanocobalamin.**

vitamin B$_{12}$ test (cyanocobalamin), a blood test that measures levels of vitamin B$_{12}$, which is necessary for conversion of the inactive form of folate to the active form, a process that is crucial in the formation and function of red blood cells. Abnormal levels may indicate leukemia, severe liver dysfunction, myeloproliferative disease, pernicious anemia, malabsorption syndromes, inflammatory bowel disease, and Zollinger-Ellison syndrome, among other conditions.

vitamin B$_{17}$. See **Laetrile.**

vitamin B complex, a group of water-soluble vitamins differing from each other structurally and in their biological effect. All of the B vitamins are found in large quantities in liver and yeast, and they are present separately or in combination in many foods. Heat and prolonged cooking, especially cooking with water, can destroy B vitamins. See also **folic acid** and vitamins **B$_1$** through **B$_{12}$.**

vitamin C. See **ascorbic acid.**

vitamin D, a fat-soluble vitamin chemically related to the steroids and essential for the normal formation of bones and teeth and for the absorption of calcium and phosphorus from the GI tract. The vitamin is present in natural foods in small amounts, and requirements are usually met by artificial enrichment of various foods, especially milk and other dairy products, and exposure to sunlight. Ultraviolet rays activate a form of cholesterol in an oil of the skin that is converted to a form of the vitamin in the kidney. The natural foods containing vitamin D are of animal origin and include saltwater fish, especially salmon, sardines, and herring; organ meats; fish-liver oils; and egg yolk. Deficiency of the vitamin results in rickets in children, osteomalacia, osteoporosis, and osteodystrophy. Hypervitaminosis D produces a toxicity syndrome characterized by anorexia, vomiting, headache, drowsiness, diarrhea, and calcification of the soft tissues of the heart, blood vessels, renal tubules, and lungs. Treatment consists of discontinuing the vitamin dosage and initiating a low-calcium diet until symptoms resolve. See also **calciferol, vitamin D$_3$.**

vitamin D$_2$. See **calciferol.**

vitamin D$_3$, an antirachitic, white, odorless crystalline unsaturated alcohol that is the predominant form of vitamin D of animal origin. It is found in most fish-liver oils, butter, brain, and egg yolk and is formed in the skin, fur, and feathers of animals and birds exposed to sunlight or ultraviolet rays. Also called **activated 7-dehydrocholesterol, cholecalciferol.**

vitamin deficiency, a state or condition resulting from the lack of or inability to use one or more vitamins. The symptoms and manifestations of each deficiency vary, depending on the specific function of the vitamin in promoting growth and development and maintaining body health.

vitamin D–resistant rickets, a genetic disease clinically similar to rickets but resistant to treatment with large doses of vitamin D. It is caused by a congenital defect in renal tubular resorption of phosphate and usually occurs in men. See also **rickets.**

vitamin E, any or all of the group of fat-soluble vitamins that consist of the tocopherols and are essential for normal reproduction, muscle development, resistance of erythrocytes to hemolysis, and various other biochemical functions. It is a fat-soluble antioxidant and acts in maintaining the stability of polyunsaturated fatty acids and other fatlike substances, including vitamin A and hormones of the pituitary, adrenal, and sex glands. Deficiency is rare and may take from months to years to occur but results in muscle degeneration, vascular system abnormalities, megaloblastic anemia, hemolytic anemia, infertility, creatinuria, and liver and kidney damage and is associated with the aging process. The richest dietary sources are wheat germ; soybean, cotton seed, peanut, and corn oils; margarine; whole raw seeds and nuts; soybeans; eggs; butter; liver; sweet potatoes; and the leaves of many vegetables, such as turnip greens. It is stored in the body for long periods of time so that any deficiency is rare. It is considered nontoxic except in hypertensive patients and those with chronic rheumatic heart disease. Alpha-tocopherol is the most physiologically active form of the group. Toxicity is also rare. Also called **alpha-tocopherol, tocopherol.**

vitamin H. See **biotin.**

vitamin K, a group of fat-soluble vitamins known as quinones that are essential for the synthesis of prothrombin in the liver and of several related proteins involved in the clotting of blood. The vitamin is widely distributed in foods, especially leafy green vegetables, pork liver, yogurt, egg yolk, kelp, alfalfa, fish-liver oils, and blackstrap molasses, and is synthesized by the bacterial flora of the GI tract. It is also produced synthetically. Deficiency results in hypoprothrombinemia, characterized by poor coagulation of the blood and hemorrhage, and usually occurs from inadequate absorption of the vitamin from the GI tract or the inability to use it in the liver. It is used to reduce the clotting time in patients with obstructive jaundice and in hemorrhagic states associated with intestinal diseases and diseases of the liver; it is given prophylactically to infants to prevent hemorrhagic disease of the newborn. Natural vitamin K is stored in the body and produces no toxicity. Excessive doses of synthetic vitamin K may cause anemia in newborns and hemolysis in people with glucose-6-phosphate deficiency. See also **vitamin K_1, vitamin K_2, menadione.**

vitamin K_1, a yellow, viscous, oil-soluble vitamin occurring naturally, especially in alfalfa, and produced synthetically. It is used as a prothrombinogenic agent. Also called **phylloquinone, phytonadione.**

vitamin K_2, a pale yellow fat-soluble crystalline vitamin of the vitamin K group that is more unsaturated than vitamin K_1 and slightly less active biologically. It is isolated from putrefied fish meal and synthesized by various bacteria in the GI tract. See also **vitamin K.**

vitamin K_3. See **menadione.**

vitamin loss [L, *vita,* life, *amine*], reduction in vitamin content of food resulting from the handling and preparation of fresh foods during harvesting, heating, pickling, salting, milling, canning, and other food-processing techniques. Further vitamin losses can occur because of digestive disorders that prevent nutrient absorption and the use of drugs such as isoniazid that are vitamin antagonists.

vitaminology /vī′təminol′əjē/ [L, *vita* + *amine* + Gk, *logos,* science], the study of vitamins, including their structures, modes of action, and function in maintaining body health.

vitamin P. See **bioflavonoid.**

vitamin supplements, any vitamins or provitamins consumed in addition to nutrients in the food eaten.

vitellin /vitel′in/ [L, *vitellus,* yolk], a lipoprotein containing lecithin, found in the yolk of eggs. Also called **ovovitellin.** —*vitelline* /-ēn/, *adj.*

vitelline artery /vitel′in, -ēn/ [L, *vitellus* + Gk, *arteria,* airpipe], any of the embryonic arteries that circulate blood from the primitive aorta of the early developing embryo to the yolk sac. Also called **omphalomesenteric artery.**

vitelline circulation, the circulation of blood and nutrients between the developing embryo and the yolk sac by way of the vitelline arteries and veins. Also called **omphalomesenteric circulation.** See also **fetal circulation.**

vitelline duct, (in embryology) the narrow channel connecting the yolk sac with the intestine. Also called **umbilical duct.**

vitelline membrane, the delicate cytoplasmic membrane surrounding the ovum. Also called **yolk membrane.** See also **zona pellucida.**

vitelline sac. See **yolk sac.**

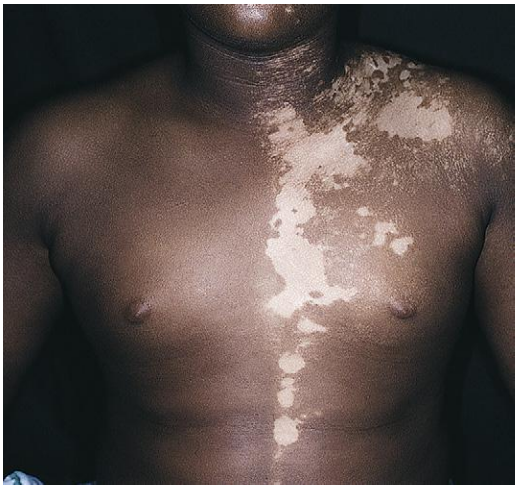
vitelline sphere. See **morula.**

vitelline vein, any of the embryonic veins that return blood from the yolk sac to the primitive heart of the early developing embryo. Also called **omphalomesenteric vein.**

vitellogenesis /vitel′ōjen′əsis/ [L, *vitellus* + Gk, *genein,* to produce], the formation or production of yolk. —*vitellogenetic, adj.*

vitellus. See **yolk.**

vitiligo /vit′ilē′gō, -ī′gō/ [L, *vitium,* blemish], a benign acquired skin disease of unknown cause, consisting of irregular patches of various sizes totally lacking in pigment and often having hyperpigmented borders. The hypopigmented area is caused by loss of melanocytes. Exposed areas of skin are most often affected. Treatment using 8-methoxypsoralen requires extreme care and carefully regulated sun exposure. Some success has been achieved with the use of narrowband ultraviolet light and topical application of protopic. Waterproof, sun-protective cosmetics are often used to cover the patches. Compare **albinism, piebald.** —*vitiliginous, adj.*



Vitiligo *(Callen et al, 2000)*

vitrectomy /vitrek′təmē/ [L, *vitreus,* glassy; Gk, *ektomē,* excision], a surgical procedure for removing the contents of the vitreous chamber of the eye, which are then replaced by oil, air, or a vitreous substitute.

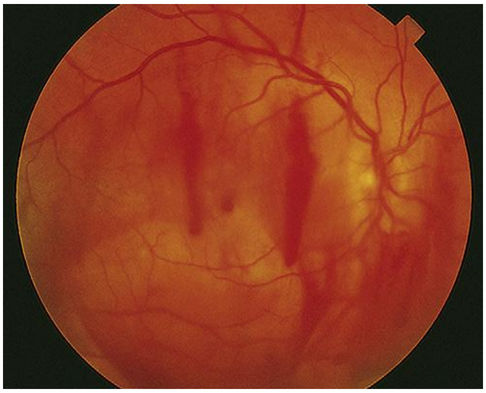
vitreous /vit′rē·əs/ [L, *vitreus,* glassy], pertaining to the vitreous body of the eye located in the posterior chamber of the eye.

vitreous body. See **vitreous humor.**

vitreous cavity [L, *vitreus,* glassy, *cavum,* cavity], the cavity in the eye posterior to the lens that contains the vitreous body and vitreous membrane and is transected by the vestigial remnants of the hyaloid canal.

vitreous degeneration [L, *vitreus,* glassy, *degenerare,* to deviate from kind], a form of hyaline degeneration; the formation of glassy material in the connective tissue of blood vessels and other tissues.

vitreous hemorrhage, a hemorrhage into the vitreous humor of the eye.



Vitreous hemorrhage *(Albert et al, 2008)*

vitreous humor, a transparent, semigelatinous substance contained in a thin hyoid membrane and filling the cavity behind the crystalline lens of the eye. Some indications of the hyaloid canal may persist in the vitreous humor, which is not penetrated by any blood vessels and is nourished at its periphery by vessels of the retina and the ciliary processes. The vitreous humor is concave anteriorly to accommodate the crystalline lens and is closely applied to the retina around the wall of the eyeball. Also called **corpus vitreum, vitreous body.**

vitreous membrane, a membrane that lines the posterior cavity of the eye and surrounds the vitreous body.

vitrification /vit′rifikā′shən/, the conversion of a silicate material by heat and fusion to a glassy substance. Heat converts the material into a viscous liquid, which hardens on cooling.

vitriol, oil of. See **sulfuric acid.**

vitronectin /vit′ro-nek′tin/, a multifunctional adhesive glycoprotein found in serum and various tissues. Its functions include regulation of the coagulation, fibrinolytic, and complement cascades, and it plays a role in hemostasis, wound healing, tissue remodeling, and cancer. It mediates the inflammatory and repair reactions at sites of tissue injury and promotes adhesion, spreading, and migration of cells. It has been shown to be identical to S protein, which was identified as an inhibitor of complement activation, binding the membrane attack complex and preventing its insertion into the membrane.

Vivactil, a trademark for a tricyclic antidepressant **(protriptyline hydrochloride).**

vivax malaria. See **tertian malaria.**

vivi-, prefix meaning “being alive”: *vivisection, viviparous.*

viviparous /vivip′ərəs/ [L, *vivus,* alive, *parere,* to bear], bearing living offspring rather than laying eggs, such as most mammals and some fishes and reptiles. Compare **oviparous, ovoviviparous.**

vivisection /viv′əsek′shən/ [L, *vivus,* alive, *secare,* to cut], the performance of surgical operations on living animals, particularly experimental surgery for the purpose of research.

Vivonex, a trademark for a nutritional supplement containing protein, carbohydrate, and fat.

VLDL, abbreviation for **very low–density lipoprotein.**

VMA, abbreviation for **vanillylmandelic acid.**

VNA, abbreviation for *Visiting Nurses Association.*

VNTR, abbreviation for **variable number of tandem repeats.**

VO_2, symbol for **oxygen uptake** or consumption.

vocal apparatus /vō′kəl/ [L, *vocalis,* voice, *ad + parare,* to prepare], the larynx, pharynx, and oral and nasal cavities involved in the production of sound.

vocal cord [L, *vocalis,* voice; Gk, *chorde,* string], one of a pair of strong bands of yellow elastic tissue in the larynx enclosed by membranes called vocal folds and attached ventrally to the angle of the thyroid cartilage and dorsally to the vocal process of the arytenoid cartilage. Also called **true vocal cord, vocal ligament.** Compare **false vocal cord.**

vocal cord dysfunction, a disorder with asthmalike symptoms caused by abnormal closure of the vocal cords.

vocal cord nodule, a small inflammatory or fibrous growth that develops on the vocal cords of people who constantly strain their voices. Also called **screamer’s nodule, singer’s nodule, teacher’s nodule.** See also **chorditis.**

vocal cues, a category of nonverbal communication that includes all the noises and sounds that are extra-speech sounds and convey meaning.

vocal folds [L, *vocalis* + AS, *fealdan*], the true vocal cords.

vocal fremitus (VF), the vibration of the chest wall as a person speaks or sings that allows the person’s voice to be heard by auscultation of the chest with a stethoscope. Vocal fremitus is decreased in emphysema, pleural effusion, pulmonary edema, and bronchial obstruction and is increased in consolidation, as in pneumonia. Compare **tactile fremitus.**

vocal ligament. See **vocal cord.**

vocal paralysis, paralysis of the vocal cords.

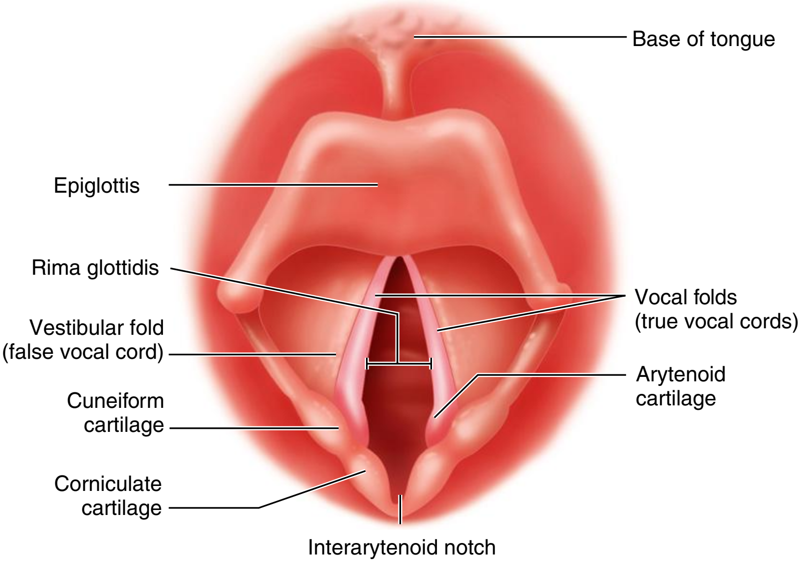
vocal register, any of the perceptually distinct regions of vocal quality, each with a characteristic range of pitches, pattern of vocal cord vibration, and tone quality. Also called **register.**

vocal resonance [L, *vocalis* + *resonare,* to sound again], **1.** auscultation. **2.** modification of the laryngeal tone as it passes through the pharynx and oral cavity to produce an increase in the intensity and quality of the sound.

vocal tract, the passages from the glottis through the nose and throat that influence the quality of the voice.

Vogt-Koyanagi-Harada syndrome /fōkt kō ·yah·nah′ge hah-rah′dah/, a syndrome of uveomeningitis associated with retinochoroidal detachment; temporary or permanent deafness and blindness; and, sometimes (usually not permanent), alopecia, vitiligo, and poliosis. The cause is unknown, but it may be an inflammatory autoimmune condition. Also called *Harada syndrome.*

Vogt-Spielmeyer disease /fōkt shpēl′mī·er/, the juvenile form of neuronal ceroid-lipofuscinosis, with onset between



Vocal cords *(Patton and Thibodeau, 2010)*

5 and 10 years of age. It is characterized by rapid cerebroretinal degeneration, massive loss of brain substance, excessive neuronal storage of lipofuscin, and death within 10 to 15 years.

voice, the acoustic component of speech that is normally produced by vibration of the vocal folds of the larynx.

voice box. See **larynx.**

voiced /voist/ [L, *vox,* voice], said of speech sounds produced with vibration of the vocal cords, such as /b/, /d/, or /z/. Also **sonorant.**

voiceless /vois′ləs/ [L, *vox,* voice + AS, *laes,* less], said of speech sounds produced without vibration of the vocal cords, such as /p/, /t/, or /s/. Also **unvoiced.**

voiceprint /vois′print/, a graphic representation of a person's speech pattern electronically recorded. Like a fingerprint, the speech pattern for any individual is distinctive.

voice sounds, auscultatory sounds heard over the lungs or airways when the patient speaks. Increased resonance indicates consolidation or an airless lung underlying an effusion. Types include bronchophony, egophony, and pectoriloquy.

void /void/ [ME, *voide,* empty], to empty or evacuate, such as urine from the bladder.

voiding. See **urination.**

voiding cystourethrography (VCU) [ME *voide,* empty; Gk, *kystis,* bag + *ourethra,* urethra + *graphein,* to record], cystourethrography in which radiographs are made before, during, and after voiding. See also **cystourethrography.**

voiding urethrography [ME, *voide,* empty; Gk, *ourethra* + *graphein,* to record], radiography of the urethra during micturition after the introduction of a radiopaque fluid into the bladder.

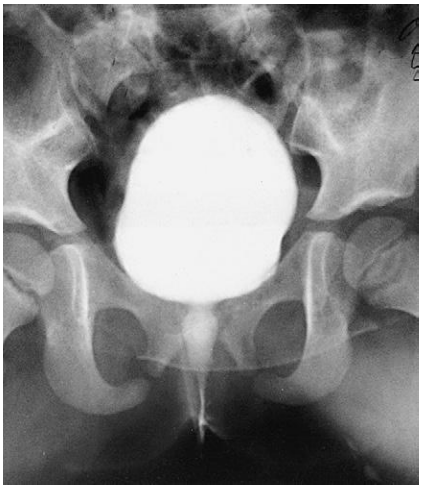
vol., abbreviation for **volume.**

vol.%, abbreviation for *volume percent.*

volar /vō′lər/ [L, *vola,* palm, sole], pertaining to the palm of the hand.

volar ligament. See **retinaculum flexorum manus.**

volatile /vol′ətəl/ [L, *volatilis,* flying], (of a liquid) easily vaporized.



Voiding cystourethrography
(Frank, Long, and Smith, 2012)

volatile solvent, an easily vaporized solvent.

-volemia, suffix meaning "(condition of the) volume of plasma in the body": *hypervolemia, hypovolemia, normovolemia.*

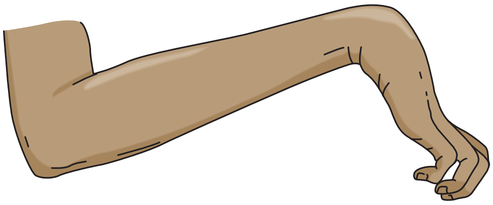
volition /vōlish′ən/ [L, *voluntas,* inclination], **1.** the act, power, or state of willing or choosing. **2.** the conscious impulse to perform or to abstain from an act. **—volitional,** *adj.*

volitional /vōlish′ənəl/ [L, *velle,* to wish], pertaining to the use of one's own will in performing or abstaining from an action.

volitional tremor [L, *velle,* to wish, *tremor,* shaking], a trembling that begins during voluntary effort, sometimes spreading throughout the body. It may occur in multiple sclerosis and cerebellar disorders. Also called **intention tremor.**

Volkmann's canal /fōlk′munz/ [Alfred W. Volkmann, German physiologist, 1800–1877], any one of the small blood vessel canals connecting haversian canals in bone tissue. Compare **haversian canaliculus.** See also **haversian system.**

Volkmann's contracture [Richard von Volkmann, German surgeon, 1830–1889], a serious persistent flexion contraction of forearm and hand caused by ischemia. A pressure or crushing injury in the region of the elbow usually precedes this condition, and pressure from a cast or tight bandage about the elbow is a common cause. Permanent fibrosis, muscle degeneration, and a clawlike hand may result. Nurses must watch for swelling, pallor, coldness, cyanosis, or pain distal to the injury site so that prompt loosening of constriction can restore circulation. Also called **ischemic contracture, Volkmann's paralysis.**



Volkmann's ischemic contracture

(Monahan et al, 2007)

Volkmann's paralysis. See **Volkmann's contracture.**

Volkmann's splint [Richard von Volkmann; AS, *splinte,* thin board], a splint that supports and immobilizes the lower leg. A foot-piece extends from the foot to the knee on both sides of the splint, allowing ambulation.

volsella forceps /volsel′ə/ [L, *vosella,* tweezers, *forceps,* tongs], a kind of forceps having a small, sharp-pointed hook at the end of each blade. Also called *volsella, volsellum forceps,* **vulsella forceps.**

volt (V) /vōlt/ [Alessandro Volta, Italian physicist, 1745–1827], the unit of electric potential. In an electric circuit a volt is the force required to send 1 ampere of current through 1 ohm of resistance, or the difference in potential between two points on a conductor carrying a charge of 1 ampere when there is a dissipation of 1 watt between them. See also **ampere, circuit, current, ohm, watt.**

voltage /vō′tij/ [Alessandro Volta], an expression of electromotive force in terms of volts.

voltage ripple. See **waveform ripple.**

voltammetry /voltam′ətərē/, the measurement of an electric current as a function of potential.

voltmeter /vōlt′mētər/, an instrument such as a galvanometer that measures in volts the differences in potential between different points of an electric circuit.

volume (vol.) /vol′yəm, -yo͞om/ [L, *volumen,* paper roll], the amount of space occupied by a body, expressed in units of cubic distance.

volume ATPS, abbreviation for ambient temperature, ambient pressure, saturated with water vapor conditions of a volume of gas. The conditions exist in a water-sealed spirograph or gasometer when the water temperature equals ambient temperature.

volume BTPS, abbreviation for body temperature, ambient pressure, saturated with water vapor. These conditions of a volume of gas are used in respiratory physiology to assess lung volume and flow. For humans, the normal respiratory tract temperature is measured at 37° C, ambient pressure, and the partial pressure of water vapor at 37° C at 47 mm Hg.

volume control fluid chamber, any one of several types of transparent plastic reservoirs with graduated volumetric markings, used to regulate the flow of IV solutions. These devices are components of IV volume control sets and accommodate the injection and mixing of medications by means of special built-in ports. The volume control fluid chamber contains a filter that must be primed to function.

volume cycling, the delivery of gas under positive pressure during inspiration until an adjustable, preselected volume has been delivered.

volume dose. See **integral dose.**

volume expander, intravenous fluids administered to increase the oncotic pressure in the intravascular space.

volume imaging, magnetic resonance (MR) imaging techniques in which MR signals are gathered at once from the whole object volume to be imaged. Many sequential plane imaging techniques can be categorized as volume imaging, at least in principle. Advantages include potential improvement in the signal-to-noise ratio as a result of the inclusion of signals from the whole volume. Disadvantages include a bigger computational task for image reconstruction and longer image acquisition times, although the entire volume can be imaged from one set of data.

volumetric analysis. See **quantitative analysis.**

volumetric flow rate /vol′yəmet′rik/, the rate at which a volume of fluid flows past a designated point, usually measured in liters per second.

volumetric glassware, (in chemistry) glassware designed and marked to contain or to deliver specific volumes of liquid solutions.

volume unit (VU), a unit of a logarithmic scale for expressing the power level of a complex audio-frequency electric signal such as that transmitting sound.

volume ventilator, a ventilator that delivers a predetermined volume of gas with each cycle.

voluntary /vol′ənter′ē/ [L, *voluntas,* inclination], referring to an action or thought originated, undertaken, controlled, or accomplished as a result of a person's free will or choice.

voluntary abortion. See **elective abortion.**

voluntary agency, a service agency legally controlled by volunteers rather than by owners or a paid staff.

voluntary hospital system, a nationwide complex of autonomous, self-established, and self-supported private not-for-profit and investor-owned hospitals in the United States.

voluntary muscle. See **striated muscle.**

volunteer /vol′əntir′/ [Fr, *volontaire*], someone who does a task voluntarily and usually without pay.

-volute, suffix meaning "to roll or turn around, or convoluted": *circumvolute, involute, revolute.*

volition. See **will.**

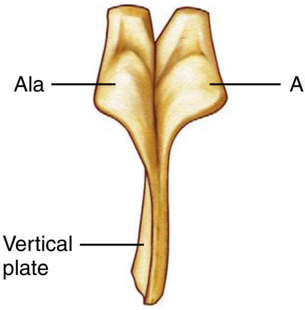
volutrauma /vol′u-traw′mah/, damage to the lung caused by overdistension by a mechanical ventilator set for an excessively high tidal volume. It results in a syndrome similar to adult respiratory distress syndrome.

volvulus /vol′vyələs/ [L, *volvere,* to turn], a twisting of the bowel on itself, causing intestinal obstruction. The condition is frequently the result of a prolapsed segment of mesentery and occurs most often in the ileum, the cecum, or the sigmoid parts of the bowel. If it is not corrected, the obstructed bowel becomes necrotic, peritonitis and rupture of the bowel occur, and death may ensue. Severe gripping pain, nausea and vomiting, an absence of bowel sounds, and a tense distended abdomen suggest the diagnosis, which is confirmed by x-ray examination. Compare **intussusception.**

volvulus neonatorum, an intestinal obstruction in a newborn resulting from a twisting of the bowel caused by malrotation or nonfixation of the colon. Typical symptoms include abdominal distension; persistent regurgitation, often accompanied by fecal vomiting; and nonpassage of stools.

Characteristic barium enema x-ray studies confirm the diagnosis. The condition requires immediate surgical correction to prevent necrosis and gangrene of the affected segment of bowel.

vomer /vō′mər/ [L, plowshare], the plow-shaped bone forming the posterior and inferior part of the nasal septum and having two surfaces and four borders.



Vomer

vomeronasal organ, a structure on each side of the nasal septum believed to be a chemical sensory center for "sixth sense" detection of pheromones, carried by the nervous terminalis.

vomit /vom′it/ [L, *vomere,* to vomit], **1.** *v,* to expel the contents of the stomach through the esophagus and out of the mouth. **2.** *n,* also called **emesis, vomitus,** the material expelled.

vomiting [L, *vomere,* to vomit], the forcible voluntary or involuntary emptying of the stomach contents through the mouth.

vomiting agents, chemicals that induce nausea and vomiting. Vomiting agents include adamsite, diphenylchlorarsine, and diphenylcyanoarsine. They are used as aerosols, and exposure is primarily by inhalation but also by ingestion and by skin and eye contact. They initially act like tear gas, and their effects progress to difficulty in breathing, nausea, and vomiting. Effects are self-limited, generally disappearing within 2 hours. Death may occur with exposure to high concentrations in confined spaces.

vomiting management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention and alleviation of vomiting. See also **Nursing Interventions Classification.**

vomiting of pregnancy, vomiting that occurs during the early months of pregnancy. Factors contributing to the condition include delayed stomach emptying during pregnancy, relaxation of the esophageal sphincter at the opening into the stomach, and relaxation of the diaphragmatic hiatus, all of which increase the risk of gastric reflux. See also **morning sickness, reflex emesis.**

vomiting reflex. See **reflex emesis.**

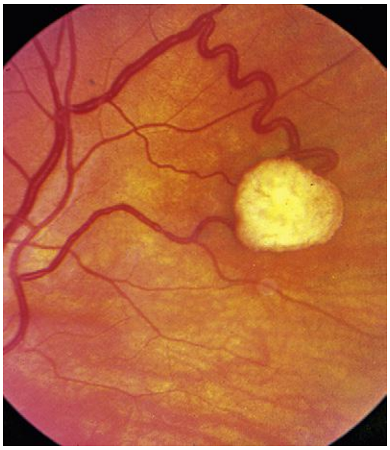
vomitus /vom′itəs/ [L, *vomere,* to vomit], pertaining to the material expelled from the stomach during vomiting. Vomitus is sometimes classified by color or other appearances as an indicator of the cause of illness, such as a "coffee-ground" vomitus being a clinical sign of gastric bleeding.

VON, abbreviation for *Victorian Order of Nurses.*

von Economo's encephalitis. See **epidemic encephalitis.**

von Gierke's disease /fôn gir′kəz/ [Edgar von Gierke, German pathologist, 1877–1945], a form of glycogen storage disease in which abnormally large amounts of glycogen are deposited in the liver and kidneys. The disorder is characterized by hypoglycemia, metabolic acidosis, dyslipidemia, and hepatomegaly. Biopsy of the affected organs reveals the absence of glucose-6-phosphatase, an enzyme necessary for glycogen metabolism. There is no effective treatment for the disorder. Medical efforts are directed at preventing hypoglycemia and acidosis. Also called **glycogen storage disease, type Ia.** See also **glycogen storage disease.**

von Hippel–Lindau disease [Eugen von Hippel, German ophthalmologist, 1867–1939; Arvid Lindau, Swedish pathologist, 1892–1958], a hereditary disease characterized by congenital, tumorlike vascular nodules in the retina and hemangioblastomas of the cerebellar hemispheres. Similar spinal cord lesions; cysts of the pancreas, kidneys, and other viscera; seizures; and mental retardation may be present. Also called **cerebroretinal angiomatosis, Lindau–von Hippel disease, retinocerebral angiomatosis.** Compare **Hippel's disease.**



von Hippel–Lindau disease
(Spalton, Hitchings, and Hunter, 2005)

von Pirquet's test. See **Pirquet's test.**

von Recklinghausen's canal. See **Recklinghausen's canal.**

von Recklinghausen's disease. See **neurofibromatosis.**

von Recklinghausen's tumor. See **Recklinghausen's tumor.**

von Willebrand disease [Erick A. von Willebrand, Finnish physician, 1870–1949], a congenital, autosomal dominant, mucocutaneous bleeding disorder caused by von Willebrand factor deficiency and subsequent impairment of platelet adhesion to the damaged blood vessel wall. Also called **vascular hemophilia.** See also **hemophilia, thrombasthenia.**

voracious [L, *vorax*], greedy or gluttonous, with an insatiable appetite.

voriconazole, an antifungal agent used to treat invasive aspergillosis and serious fungal infections.

-vorous, suffix meaning "feeding on something": *leguminivorous, panivorous.*

vortex *pl. vortexes, vortices* [L, whirl], a whirlpool effect produced by the whirling of a more or less cylindric mass of fluid (liquid or gas). The velocity of the motion increases as the radius of the circle described by the motion decreases; the velocity decreases as the radius increases. Tornadoes and whirlpools are examples of free vortexes.

vorticose veins, four large veins involved in the venous drainage of the eyeball. They exit through the sclera from each of the posterior quadrants of the eyeball and enter the superior and inferior ophthalmic veins.

voxel /vok′səl/, abbreviation for *vo*lume element, the three-dimensional version of a pi*xel*.

voyeur /voiyur′, vô·äyœr′/ [Fr, *voir,* to see], one whose sexual desire is gratified by the practice of voyeurism. The female counterpart is a **voyeuse.** Also called **Peeping Tom.**

voyeurism /voi′yəriz′əm, voiyur′izəm/ [Fr, *voyeur* + L, *ismus,* practice], a psychosexual disorder in which a person derives sexual excitement and gratification from looking at the naked bodies and genital organs or observing the sexual acts of others, especially from a secret vantage point. See also **compulsion.**

VP, abbreviation for **variegate porphyria.**

VPF, abbreviation for **vascular permeability factor.** See **vascular endothelial growth factor.**

V/Q, abbreviation for *ventilation/perfusion*. See **ventilation/perfusion ratio.**

VR, abbreviation for *variable ratio*. See **variable ratio reinforcement.**

VRA, abbreviation for **visual response audiometry.**

VRE, abbreviation for *vancomycin-resistant enterococci*.

V.S., **1.** abbreviation for **vesicular breath sound.** **2.** abbreviation for *Veterinary Surgeon*. **4.** abbreviation for *volumetric solution*.

VSD, abbreviation for **ventricular septal defect.**

VU, abbreviation for **volume unit.**

vulgaris /vulger′is/ [L, *vulgus,* common people], common or ordinary.

vulnerable /vul′nərəbəl/ [L, *vulnus,* wound], being in a dangerous position or condition and thereby susceptible to being infected or injured.

vulnerable period, a short period in the cardiac cycle during which activation may result in an ectopic beat. The ventricular vulnerable period corresponds to the apex of the T wave toward its ascending side.

vulnerable population. See **population at risk.**

vulsella forceps. See **volsella forceps.**

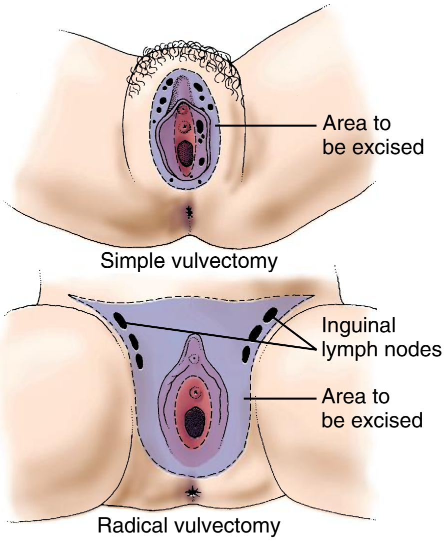
vulva. See **pudendum.**

vulvar /vul′vər/, pertaining to the vulva.

vulvar dystrophy, a disorder characterized by skin eruptions of white atrophic pustules, squamous cell hyperplasia, and lichen sclerosis et atrophicus.

vulvectomy /vulvek′təmē/ [L, *vulva,* wrapper; Gk, *ektomē,* excision], the surgical removal of part or all of the tissues of the vulva, performed most frequently in the treatment of malignant or premalignant neoplastic disease. **Simple vulvectomy** includes the removal of the skin of the labia minora, labia majora, and clitoris. **Radical vulvectomy** involves excision of the labia majora, labia minora, clitoris, surrounding tissues, and pelvic lymph nodes.

vulvitis /vulvī′tis/ [L, *vulva,* wrapper; Gk, *itis,* inflammation], an inflammation of the vulva.



Vulvectomy *(Ignatavicius and Workman, 2010)*

vulvo-, prefix meaning "relating to the vulva": *vulvectomy, vulvovaginal*.

vulvocrural /vul′vōkro͞o′rəl/ [L, *vulva* + *crus,* leg], pertaining to the vulva and the thigh.

vulvodynia /vul′vōdin′ē·ə/, chronic pain and discomfort in the female external genitals.

vulvovaginal /vul′vōvaj′inəl/ [L, *vulva* + *vagina,* sheath], pertaining to the vulva and the vagina.

vulvovaginal candidiasis, candidal infection of the vagina, and usually also the vulva, commonly characterized by pruritus, creamy white discharge, vulvar erythema and swelling, and dyspareunia. Also called ***Candida* vaginitis, *Candida* vulvovaginitis, vaginal candidiasis.**

vulvovaginitis /vul′vōvaj′inī′tis/, an inflammation of the vulva and vagina or of the vulvovaginal glands.

vv, **1.** an abbreviation for *veins*. **2.** an abbreviation for *vice versa*.

v/v, **1.** symbol for *volume of dissolved substance per volume of solvent*. **2.** symbol for *volume per volume*.

v/w, symbol for *volume of substance per unit of weight of another component*.

vWF, abbreviation for *von Willebrand's factor*.

VY plasty /vē′wī′ plas′tē/, a surgical incision made in a V shape and sutured in a Y shape to lengthen the tissue area. In a variation of the procedure, the incision is made in a shape and sutured in a shape to shorten the tissue area. See also **flap.**

Vyvanse, a trademark for **lisdexamfetamine.**

VZIG, abbreviation for **varicella-zoster immune globulin.**

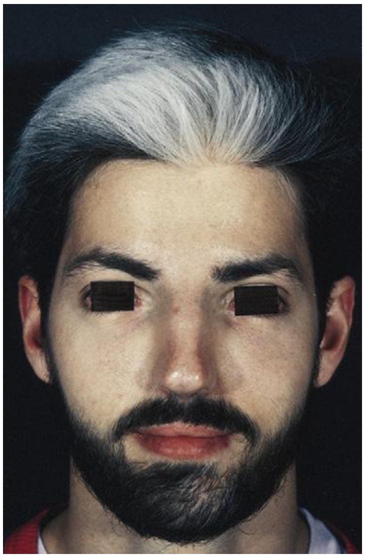
VZV, abbreviation for **varicella zoster virus.**

W

w, the amount of energy required to ionize a molecule of air, as expressed by w |m= 33.85 eV/ion pair. This is an important quantity for radiation dosimetry because it allows the extraction of dose from ionization measurements.

W, **1.** abbreviation of **watt.** **2.** symbol for the element **tungsten.**

Waardenburg's syndrome /vär′den·bərgz/ [Petrus Johannes Waardenburg, Dutch ophthalmologist, 1886–1979], **1.** an autosomal-dominant disorder characterized by wide bridge of the nose resulting from lateral displacement of the inner canthi and puncta, pigmentary disturbances, including white forelock, heterochromia iridis, white eyelashes, leukoderma, and sometimes cochlear deafness. **2.** an autosomal-dominant disorder characterized by acrocephaly, orbital and facial deformities, and brachydactyly with mild soft tissue syndactyly. Cleft palate, congenital glaucoma, cardiac malformation, and contractures of the elbows and knees may also be present. Also called **acrocephalosyndactyly, Klein-Waardenburg syndrome.**



Waardenburg's syndrome

(Hordinsky, Sawaya, and Scher, 2000)

waddling gait /wod′ling/ [ME, *waden,* to wade; ONorse, *gata,* way], a gait characterized by exaggerated lateral trunk movements and hip elevations. It is observed in pregnancy and in patients with osteoarthritis of the hip or progressive muscular dystrophy.

WAGR syndrome, a syndrome of *W*ilms' tumor, *a*niridia, *g*enitourinary abnormalities or *g*onadoblastoma, and mental *r*etardation, resulting from a small interstitial deletion on chromosome 11.

Wagstaffe's fracture /wag′stafs/ [William Wagstaffe, English surgeon, 1834–1910; L, *fractura,* break], a fracture characterized by separation of the medial malleolus of the tibia.

waiting list, a roll of persons waiting to fill a vacancy, such as a list of candidates waiting for an organ transplant.

wakefulness /wāk′fulnəs/, **1.** an alert state of mind. **2.** sleeplessness or insomnia.

waking imagined analgesia (WIA) [AS, *wacian,* to awaken; L, *imaginari,* to picture oneself; Gk, *a* + *algos,* without pain], the pain relief experienced by a patient who uses the psychological technique, usually with the help of an attending nurse or a hospital aide, of concentrating on previous pleasant personal experiences that produced tranquility, such as lying on a summer beach beside cooling ocean water or drifting down a quiet river in a canoe. The patient using the WIA technique is encouraged to verbalize such experiences, thereby reinforcing recollection with attendant soothing biological responses. This technique is often effective in reducing mild to moderate pain, especially when used with a mild nonnarcotic analgesic and the compassionate interaction of an attending health care professional. See also **pain assessment, pain intervention.**

waking paralysis, paralysis experienced momentarily upon awakening, usually improving within seconds.

waking ptosis. See **morning ptosis.**

Waldenström's macroglobulinemia. See **macroglobulinemia.**

Waldeyer's throat ring /wäl′dī·ərz/ [Heinrich W.G. von Waldeyer, German anatomist, 1836–1921; AS, *hring*], the palatine, pharyngeal, and lingual tonsils that encircle the pharynx. Also called **lymphoid ring, tonsillar ring.**

Wald, Lillian [1867–1940], an American public health nurse, settlement leader, and social reformer. She founded the Henry Street Settlement in New York to bring nursing care into the homes of the poor. This led to the development of the Visiting Nurse Service of New York. She was also instrumental in establishing the school nursing system, the federal government's Children's Bureau, and the Nursing Service Division of the Metropolitan Life Insurance Company. She was the first nurse to be elected into the Hall of Fame for Great Americans.

walker /wô′kər/ [AS, *wealcan,* to roam], **1.** an assistive device made of metal tubing, used to aid a patient in walking. It has four widely placed, sturdy legs. The patient holds onto the walker and takes a step with each leg and then moves the walker forward and takes another step with each leg. Wheeled walkers have wheels on the rear two legs or on all four legs. A walker can be used by an individual with a lower extremity that is full, partial, or non–weight-bearing. It should be used only on flat, level surfaces. The walker is considered the most stable of the ambulatory assistive devices. Compare **crutch.** **2.** A small, rubber or plastic heel attached to the bottom of a walking cast to prevent the cast from slipping on hard surfaces. Also called **walking heel.**

Walker-Warburg syndrome /waw′kər·vär′bŏŏrg/ [Arthur Earl Walker, American surgeon, b. 1907; Mette Warburg, Danish ophthalmologist, 20th century], a congenital syndrome, usually fatal before the age of 1 year, consisting of hydrocephalus, agyria, various ocular anomalies such as retinal dysplasia, corneal opacity, or microphthalmia, and

Two types of walkers *(Bonewit-West, 2012)*

sometimes encephalocele. Also called **HARD syndrome, Walker's lissencephaly, Warburg's syndrome.**

walking belt, a leather or nylon device with handles that fastens around the patient's waist and assists the health care provider with the patient's ambulation. Also called **gait belt.**

walking cast [AS, *wealcan,* to roam; ONorse, *kasta*], a cast that permits a patient to walk. See also **long-leg cast with walker, short-leg cast with walker.**

walking heel. See **walker.**

walking pneumonia. See **mycoplasma pneumonia.**

walking program, an aerobic exercise regimen of walking 30 to 45 minutes a day 5 or 6 days a week. It may be part of a program to condition the heart or to lower blood pressure.

walking reflex, a series of steplike motions of an infant's legs when the infant is held under the arms and with the feet in contact with a surface. The reflex disappears at approximately 4 to 8 weeks of age.

walking rounds [AS, *wealcan* + Fr, *rond*], rounds in which a clinician leads a group of junior clinicians on rounds to visit the patients for whom they are collectively responsible.

walking typhoid [AS, *wealcan,* to roam; Gk, *typhos,* fever, *eidos,* form], an ambulatory subclinical case of typhoid fever. The person may be infected with typhoid but have mild symptoms that do not interfere with the activities of daily living.

walking wounded [AS, *wealcan,* to roam, *wund*], a triage term for an injured person who is ambulatory and has minor injuries.

wall [L, *vallum,* palisade], a limiting structure within the body, such as the wall of the abdominal, thoracic, or pelvic cavities or the wall of a cell.

Wallenberg's syndrome /väl′en·bergz/ [Adolf Wallenberg, German physician, 1862–1949], a syndrome resulting usually from occlusion of the vertebral artery, and less often from occlusion of its branch, the posterior inferior cerebellar artery; marked by loss of temperature and pain sensations of the face on the same side as the legion, contralateral loss of these sensations in the trunk and extremities, and a variety of other neurological and ocular symptoms including Horner's syndrome. Also called **lateral medullary syndrome, posterior inferior cerebellar artery syndrome.**

wallerian degeneration /waler′ē·ən/ [Augustus V. Waller, English physician, 1816–1870; L, *degenerare,* to degenerate], the fatty degeneration of a nerve fiber after it has been severed from its cell body.

wall stress, the tension within the wall of the left ventricle. It is determined by the pressure in the ventricle, the internal radius of the ventricle, and the thickness of the wall. Also called *wall tension*.

wander /won′dər/ [AS, *wandrian*], **1.** to move about purposelessly. **2.** to cause to move back and forth in an exploratory manner; for example, in inserting an intrauterine catheter, the tip of the inserter usually must be wandered around the fetal head in the cervix to find a space through which the catheter may be passed upward into the uterus.

wandering abscess [AS, *wandrian* + L, *abscedere,* to go away], an abscess that moves through tissue openings to a point some distance from its origin.

wandering atrial pacemaker [AS, *wandrian* + L, *passus* + ME, *maken*], a sinus arrhythmia with an atrial or junctional escape rhythm during the slow phase of the sinus rhythm. Frequently there are atrial fusion beats when impulse from the two pacing sources collide within the atrial. An accelerated junctional rhythm that competes with the sinus rhythm is often mislabeled "wandering pacemaker."

wandering goiter. See **diving goiter.**

wandering rash. See **geographic tongue.**

wandering spleen. See **floating spleen.**

Wangensteen apparatus /wang′ənstēn/ [Owen H. Wangensteen, American surgeon, 1898–1981; L, *ad* + *parare,* to prepare], a nasogastroduodenal catheter and suction apparatus used for constant gentle drainage and decompression of the stomach or duodenum. It may be used to relieve abdominal distension that often occurs after surgery or that may complicate a GI disorder, especially an intestinal obstruction. See also **Wangensteen tube.**

Wangensteen tube [Owen H. Wangensteen], the catheter part of a Wangensteen apparatus.

Warburg's syndrome. See **Walker-Warburg syndrome.**

ward /wôrd/ [AS, *weard,* guard], **1.** a large room in a hospital for the accommodation of several patients. **2.** a division within a hospital for the care of numerous patients having the same condition, e.g., a maternity ward.

warfarin poisoning /wôr′fərin/ [Wisconsin Alumni Research Foundation + coumarin], a toxic condition caused by the ingestion of warfarin accidentally in the form of a rodenticide or by overdose with the substance in its pharmacological anticoagulant form. The poison accumulates in the body and results in nosebleed, bruising, hematuria, melena, and internal hemorrhage. Vitamin K is the antidote to warfarin.

warfarin sodium, an oral anticoagulant.

■ INDICATIONS: It is prescribed for the prophylaxis and treatment of thrombosis, atrial fibrillation, and embolism.

■ CONTRAINDICATIONS: Pregnancy, severe renal or hepatic disease, uncontrolled hypertension, hemorrhage, hemorrhagic tendencies (e.g., due to hemophilia), leukemia, and known hypersensitivity to this drug are among the things that prohibit its use.

■ ADVERSE EFFECTS: The most serious adverse effect is hemorrhage. Many other drugs interact with this drug to increase or decrease its effects.

warm-blooded [AS, *wearm* + *blod*], having a relatively high and constant body temperature, such as the temperatures maintained by humans, other mammals, and birds, despite changes in environmental temperatures. Heat is produced in the warm-blooded human body by the catabolism of foods in proportion to the amount of work performed by the tissues in the body. Heat is lost from the body by evaporation, radiation, conduction, and convection. About 80% of the body heat that is dissipated in humans is lost through the skin. The rest is lost through the mucous membranes of the respiratory, the digestive, and the urinary systems. The average temperature of the healthy human is 98.6° F (37° C). Also called **homoiothermal, homothermal.** Compare **cold-blooded.**

warmup, light calisthenics and stretching exercises intended to increase flexibility, minimize risk of musculoskeletal complications, and gradually increase heart rate before the start of strenuous athletic activity.

war neurosis. See **combat fatigue.**

wart. See **verruca.**

Warthin's tumor. See **papillary adenocystoma lymphomatosum.**

washout /wosh′out/ [AS, *wascan,* to wash; ME, *oute*], the elimination or expulsion of one gas or volatile anesthetic agent from the lung alveoli by the administration of another.

wasp /wosp/ [L, *vespa*], a thin, narrow-waisted hymenopteran insect with two pairs of membranous wings that are folded lengthwise when at rest, like parts of a fan. Many species of wasps can give painful stings that produce severe effects in hypersensitive individuals. Treatment is as for bee stings. See also **bee sting, yellow jacket venom.**

Paper wasp *(Auerbach, 2007)*

Wassermann blood test /was′ərmən, vos′ərmun/ [August P. von Wassermann, German bacteriologist, 1866–1925], the first standard diagnostic blood test (no longer used) for syphilis based on the complement fixation reaction.

wasted ventilation, the volume of air that ventilates the physiological dead space in the respiratory system.

waste products [L, *vastare,* to destroy, *producere,* to produce], the products of metabolic activity after oxygen and nutrients have been supplied to a cell. These include mainly carbon dioxide and water, along with sodium chloride and soluble nitrogenous salts, which are excreted in feces, urine, and exhaled air.

wasting [L, *vastare,* to destroy], a process of deterioration marked by weight loss and decreased physical vigor, appetite, and mental activity. See also **wasting syndrome.**

wasting palsy. See **amyotrophic lateral sclerosis.**

wasting syndrome, a condition characterized by weight loss associated with chronic fever and diarrhea. Over a period of 1 month, the patient may lose 10% of baseline body weight. In cases of human immunodeficiency virus infection, the malnutrition of wasting exacerbates the condition.

watchfulness /woch′fəlnes/, continuous supervision, either open or unobtrusive, as the situation indicates.

water (H_2O) /wô′tər/ [AS, *waeter*], a chemical compound, one molecule of which contains one atom of oxygen and two atoms of hydrogen. Almost three quarters of the earth's surface is covered by water. Essential to life as it exists on this planet, water makes up more than 70% of living things. Pure water freezes at 32° F (0° C) and boils at 212° F (100° C) at 760 mm Hg.

waterbed, a closed rubber bag filled with water and used as a mattress to prevent or treat pressure ulcers by equalizing the patient's weight against the support. Also called **water mattress.**

water-borne, carried by water, such as a water-borne epidemic of typhoid fever.

water brash, heartburn with regurgitation into the mouth of fluid that may be sour or almost tasteless.

water for hemodialysis, water for use in hemodialysis, produced by subjecting water meeting the requirements of drinking water regulations to further treatment to reduce chemical and microbiological components. It contains no added antimicrobials and is not intended for injection.

water-hammer pulse. See **collapsing pulse, Corrigan's pulse.**

Waterhouse-Friderichsen syndrome /wô′tərhous′ frid′ərik′sən/ [Rupert Waterhouse, English physician, 1873–1958; Carl Friderichsen, Danish physician, b. 1886–1979], overwhelming cerebrospinal meningitis, most often caused by meningococcal infection, characterized by the sudden onset of fever, cyanosis, petechiae, and collapse from massive, bilateral adrenal hemorrhage. It requires immediate emergency treatment, hospitalization, and intensive care. Emergency treatment includes vasopressor drugs, IV fluids, plasma, and oxygen. No sedatives or narcotics are given. Specific treatment is intensive antibiotic therapy, given parenterally and continued for several days after symptoms subside. Nursing care includes close observation and maintaining adequate provision of fluids and nutrients.

watering can perineum, a perineum with numerous fistulas leaking urine owing to abscesses or sometimes strictures of the urethra.

water-in-oil emulsion, one in which water or aqueous solution is the dispersed phase and oil or oleaginous substance is the continuous phase.

water intoxication, an increase in the volume of free water in the body, resulting in dilutional hyponatremia. Common causes are excessive ingestion of water, increased infusions of hypotonic IV solutions, or excess secretions of antidiuretic hormone. Clinical manifestations are abdominal cramps, nausea, vomiting, lethargy, and dizziness. It can potentially lead to convulsions and coma. See also **syndrome of inappropriate antidiuretic hormone secretion.**

water mattress. See **waterbed.**

water moccasin. See **cottonmouth.**

water pollution, the contamination of lakes, rivers, and streams by industrial or community sources of pollutants.

water purification, emergency, methods of purifying unclean water for drinking purposes in emergencies. The three basic techniques include boiling the water and straining it through a cloth, adding 3 drops of tincture (alcoholic solution) of iodine per each quart of the water, and adding 10 drops of 1% chlorine bleach per each quart of water. When purifying chemicals are added, they should be thoroughly mixed with the water, and the mixture allowed to stand for 30 minutes. Also called *emergency preparation of safe drinking water.*

waters. See **amniotic fluid.**

watershed infarct /wô′tərshed/, an area of necrosis in the brain caused by an insufficiency of blood where the distributions of cerebral arteries overlap. The condition resembles that of an agricultural field irrigation system, in which the most distant sections may not be irrigated if there is a fall in water pressure.

Waters method, a technique for producing a radiographic image of the facial bones and maxillary sinuses. The patient faces the image receptor (IR) and tilts the forehead away from the IR, with the nose barely touching and the chin resting on the surface of the IR. The orbitomeatal line forms a 37-degree angle with the plane of the IR. The x-ray beam is perpendicular and passes through the parietal bones and exits at the junction of the patient's nose and upper lip or at the location of the anterior nasal spine. See also **orbitomeatal line.**

water-soluble contrast medium, an iodinated contrast medium that is absorbed by the blood and excreted by the kidneys. Among the advantages of a water-soluble contrast medium are that it does not need to be removed after a procedure and that it may reduce the length of the procedure.

water trap. See **underwater seal.**

Watson-Crick helix /wôt′sən krik′/ [John Dewey Watson, American geneticist, b. 1928; Francis H. Crick, British biochemist, b. 1916–2004; Gk, *helix,* coil], a model of the deoxyribonucleic acid (DNA) molecule proposed by Watson and Crick as two right-handed polynucleotide chains coiled around the same axis as a double helix. The purine and pyrimidine bases of each strand are on the inside of the double helix and paired according to a Watson-Crick hydrogen-bonding base-pairing rule. Variations in the sequences of the bases determine the genetic information transmitted by the DNA molecule. Watson and Crick received the Nobel Prize in 1962.

Watson, Jean, a nursing theorist who proposed a philosophy and science of caring in 1979 in an effort to reduce the dichotomy between theory and practice. Her theory of human caring reflects an existential phenomenologist's view of psychology and humanities. Caring is a universal social phenomenon that is only effectively practiced interpersonally. Watson identified 10 caring factors: (1) the formation of a humanistic-altruistic system of values; (2) the instillation of faith-hope; (3) the cultivation of sensitivity to self and others; (4) the development of a helping-trust relationship; (5) the promotion and acceptance of the expression of positive and negative feelings; (6) the systematic use of the scientific problem-solving method for decision making; (7) the promotion of interpersonal teaching-learning; (8) the provision for a supportive, protective, and corrective mental, physical, sociocultural, and spiritual environment; (9) assistance with the gratification of human needs; and (10) the allowance for existential-phenomenological forces. According to Watson, caring is a nursing term, and nursing concerns itself with health promotion, restoration, and prevention of illness as opposed to curing. Clients require holistic care that promotes humanism, health, and quality of living.

watt (W) /wot/ [James Watt, Scottish engineer, 1736–1819], the unit of electric power or work in the meter/kilogram/second system of notation. The watt is the product of the voltage and the amperage. One watt of power is dissipated when a current of 1 ampere flows across a difference in potential of 1 volt. See also **ampere, current, ohm, volt.**

watt per square centimeter (W/cm^2), a unit of power density or intensity used in ultrasonography.

wave [AS, *wafian,* to fluctuate], a periodic disturbance in which energy moves through a medium without permanently altering the constituents of the medium. Electromagnetic waves, such as light, x-rays, and radio waves, can travel through a vacuum. Sound waves can be transmitted only through matter. See also **electromagnetic radiation, light, sound, x-ray.**

waveform, **1.** the graphic representation of a wave, derived by plotting a characteristic wave against time. **2.** the form of an arterial pressure pulse or displacement wave. **3.** the representation of a neuromuscular electric stimulation unit, which is usually a symmetric or asymmetric biphasic pulse with two phases in each pulse. The two phases continually alternate or reverse in direction between positive and negative polarity.

waveform ripple, a temporal variation in the voltage across the x-ray tube. Also called **voltage ripple.**

wavelength, the distance between a given point on one wave cycle and the corresponding point on the next successive wave cycle. A pure color is produced by light of a specific wavelength. Electromagnetic waves of different wavelengths account for many of the transmission characteristics of radio and television.

wax, a low-melting, high–molecular-weight organic mixture or compound similar to fats and oils but lacking glycerides. See also **cerumen.**

wax bath. See **paraffin bath.**

waxy flexibility. See **cerea flexibilitas.**

Wb, abbreviation for **Weber.**

WBC, abbreviation for **white blood cell.** See **leukocyte.**

wbt, abbreviation for *wet bulb thermometer.*

wc, abbreviation for **wheelchair.**

W chromosome, the sex chromosomes of certain insects, birds, and fish. Females of such animals are heterogametic and have one W and one Z chromosome, whereas males are homogametic and have two Z chromosomes. The ZZ-ZW nomenclature was chosen to differentiate this system from the XX-XY system, which occurs in humans and various other animals and in which the female is homogametic and the male is heterogametic.

W/cm^2, abbreviation for **watt per square centimeter.**

W/D, **1.** abbreviation for *well developed,* often used in the initial identifying statement in a patient record. It is used so frequently as to have lost all meaning or use in identifying or describing the patient. **2.** abbreviation for *withdrawal.*

weakness /wēk′nəs/, a condition of being feeble, fragile, frail, or decrepit or lacking physical strength, energy, or vigor. Causes of weakness include muscle disuse and nerve injury. Partially denervated muscle shows some degree of weakness, whereas completely denervated muscle becomes flaccid. Concomitant with partial denervation is a patient's complaint of rapid fatigue and diminished capacity to perform activities of daily living. Deep tendon reflexes are diminished or absent, and electromyographic readings are abnormal.

wean [AS, *wenian,* to accustom], **1.** to induce a child to give up breastfeeding and accept other food in place of breast milk. Many children are ready for weaning during the second half of the first year; some wean themselves. **2.** to withdraw a person from something on which he or she is dependent. **3.** to remove a patient gradually from dependency on mechanical ventilation.

weanling, a child who has recently been weaned.

weapons of mass destruction (WMD), weapons, such as nuclear or chemical weapons, whose purpose is to kill large numbers of people indiscriminately.

wear-and-tear theory /wer/, one theory of biological aging in which structural and functional changes occur during the aging process (e.g., osteoarthritis). Damage accumulates when the body fails to repair itself.

weaver's bottom [AS, *wefan,* to weave, *botm,* undersurface], a form of bursitis affecting the ischial bursae in people whose work requires prolonged sitting in one position. See also **bursitis.**

web, a network of fibers and cells forming a tissue or a membrane.

webbed neck /webd/, a congenital thick fold of skin and fascia that stretches from the mastoid process to the clavicle on the lateral aspect of the neck. It occurs in such genetic conditions as Noonan's syndrome and Turner's syndrome. Also called **pterygium colli.**

webbed penis, a penis enclosed by the skin of the scrotum.

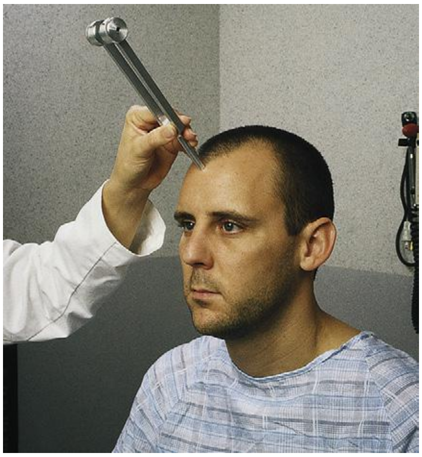
webbed toes [AS, *wefan,* to weave, *t*], an abnormality in which the toes are connected by webs of skin.

webbing, skinfolds connecting adjacent structures such as fingers or toes or the neck from the acromion to the mastoid, associated with genetic anomalies.

weber (Wb) /web′ər/ [Wilhelm Edward Weber, German physicist, 1804–1891], a unit of magnetic flux equal to 1 m^2kg/s^2A.

Weber's sign /web′ərz/ [Hermann D. Weber, English physician, 1823–1918], ipsilateral oculomotor nerve paresis and contralateral paralysis of the face, tongue, and extremities caused by a midbrain lesion. Also called **Weber's paralysis.**

Weber's tuning fork test, a method of screening auditory acuity. It is especially useful in determining whether a hearing loss in one ear is a conductive or a sensorineural loss. The test is performed by placing the stem of a vibrating tuning fork in the center of the person's forehead, or the midline vertex. The loudness of the sound is equal in both ears if hearing is normal or if there is a symmetric hearing loss. If the person has a sensorineural loss in one ear, the unaffected ear perceives the sound as louder. When conductive hearing loss is present in one ear, the sound is perceived as louder in that ear because it does not hear ordinary background noise conducted through the air and receives only vibrations by bone conduction.



Weber's tuning fork test
(Harkreader, Hogan, and Thobaben, 2007)

web of causation, an interrelationship of multiple factors that contribute to the occurrence of a disease.

Webril, a trademark for a stretchable cotton material applied over the skin to protect it from plaster irritation.

Wechsler intelligence scales /weks′lər/ [David Wechsler, American psychologist, b. 1896], a series of standardized tests designed to measure the intelligence at several age levels, from preschool through adult, by means of questions that examine general information, arrangement of pictures and objects, vocabulary, memory, reasoning, and other abilities.

wedge /wej/ [AS *wecg*], **1.** a piece of material thick at one end and tapering to a thin edge at the other end. **2.** to force something into a space of limited size. See also **wedge pressure.**

wedge fracture /wej/ [AS, *wecg,* peg; L, *fractura,* break], a fracture of the vertebral body with anterior compression.

wedge pressure, the blood pressure in the left atrium, determined with a cardiac catheter wedged in the most distal segment of the pulmonary artery. See also **pulmonary wedge pressure.**

wedge resection, the surgical excision of part of an organ, such as part of an ovary containing a cyst. The segment excised may be wedge-shaped.

WEE, abbreviation for **western equine encephalitis.** See **equine encephalitis.**

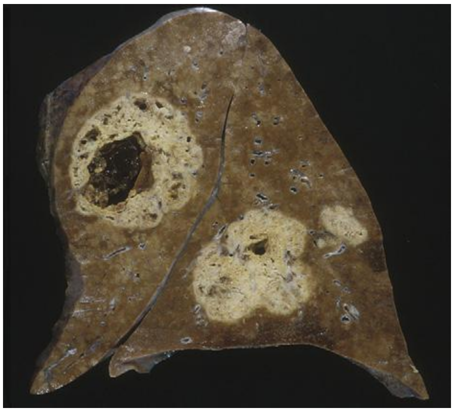
weed. See **cannabis.**

weeping [AS, *wepan,* to cry], **1.** crying, lacrimating. **2.** oozing or exuding fluid, such as a sore or rash.

weeping eczema [AS, *wepan,* to cry; Gk, *ekzein,* to boil over], an inflammatory form of skin disease marked by a fluid exudate.

weeping lubrication, a form of hydrostatic lubrication in which the interstitial fluid of hydrated articular cartilage flows onto its surface when a load is applied.

Wegener's granulomatosis /wā′gənərz/ [Friedrich Wegener, German pathologist, 1907–1990; L, *granulum,* little grain; Gk, *oma,* tumor, *osis,* condition], an uncommon disease occurring mainly in the fifth decade and characterized by granulomatosis vasculitis of the upper and lower respiratory tract, necrotizing glomerulonephritis, and varying degrees of small-vessel vasculitis. Symptoms may include sinus pain; bloody, purulent nasal discharge; saddlenose deformity; chest discomfort and cough; weakness; anorexia; weight loss; and skin lesions. Renal involvement is seen in 80% of cases. Use of cytotoxic drugs, especially cyclophosphamide, has produced long-term remissions in many patients. The cause of the disease is unknown.



Wegener's granulomatosis *(Kumar et al, 2007/Courtesy Dr. Sidney Murphree, Department of Pathology, University of Texas Southwestern Medical School)*

Weigert-Meyer rule, in cases of double ureter, the ureter from the upper pole of the kidney usually opens below and medial to the one from the lower pole. Also called **Weigert-Meyer law.**

weight (wt) /wāt/ [AS, *gewiht*], the force exerted on a body by gravitational attraction. As a body moves away from the earth, the weight of the body decreases, but the mass remains constant. In empty space a body has mass but no weight. Weight is sometimes measured in units of force such as newtons or poundals, but it is usually expressed in pounds or kilograms, as is mass. See also **mass.**

weight: body mass, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent to which body weight, muscle, and fat are congruent to height, frame, gender, and age. See also **Nursing Outcomes Classification.**

weight gain assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating gain of body weight. See also **Nursing Interventions Classification.**

weight gain behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to gain weight following voluntary or involuntary significant weight loss. See also **Nursing Outcomes Classification.**

weight holder, a metal, T-shaped bar that holds weights for traction.

weightlessness [AS, *gewiht* + ME, *les*], a state of absence of apparent weight, as in being beyond the effects of gravitational force in space travel. See also **space medicine.**

weightlifter's headache, a type of headache sometimes experienced by weightlifters and others engaged in resistance forms of exercise. The headache is commonly occipital or upper cervical and comes on suddenly while straining, perhaps as a result of cervical ligament damage. The pain may be severe, steady, burning, or boring and may last for days.

weightlifting, a resistance form of exercise that involves the lifting of maximum heavy weights in a prescribed manner.

weight loss, a reduction in body weight. The loss may be the result of a change in diet or life-style or a febrile disease. To lose 1 pound a week a person must consume 500 fewer calories daily and/or expend 500 more calories daily through physical activity. See also **wasting.**

weight loss behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to lose weight through diet, exercise, and behavior modification. See also **Nursing Outcomes Classification.**

weight maintenance behavior, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as personal actions to maintain optimum body weight. See also **Nursing Outcomes Classification.**

weight management, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating maintenance of optimal body weight and percent body fat. See also **Nursing Interventions Classification.**

weight per volume (w/v) solution, the relationship of a solute to a solvent expressed as grams of solute per milliliter of the total solution. An example is 50 g of glucose in 1 L of solution, considered a 5% w/v solution.

weight reduction assistance, a nursing intervention from the Nursing Interventions Classification (NIC) defined as facilitating loss of weight and/or body fat. See also **Nursing Interventions Classification.**

weight-reduction diet, a diet used to decrease body weight. It must supply fewer calories than the individual expends each day while supplying all the essential nutrients for maintaining health.

weights and measures, a system of establishing units or parts of quantities of substances, including standards of mass or volume.

weight traction [AS, *gewiht* + L, *trahere,* to draw], traction applied to a limb or part of a limb by means of a suspended weight.

weight training, a type of resistance-training exercise using barbells, dumbbells, or machines to increase muscle strength. See also **strength training.**

Weill-Marchesani syndrome /vīl mär·kə·sä′nē/ [Georges Weill, French ophthalmologist, 1866–1952; Oswald Marchesani, German ophthalmologist, 1900–1952], a congenital disorder of connective tissue, autosomal dominant or recessive, characterized by brachycephaly, shortened digits, short stature with broad chest and heavy musculature, reduced joint mobility, and a variety of ocular defects. Also called **Marchesani's syndrome.**

Weil's disease. See **leptospirosis.**

Weiss' sign. See **Chvostek's sign.**

well baby care [AS, *wyllan,* to wish; ME, *babe* + L, *garrire,* to chatter], periodic health supervision for infants and children to promote optimal physical, emotional, and intellectual growth and development. Such health care measures include routine immunizations to prevent disease, screening procedures for early detection and treatment of illness, and parental guidance and instruction in proper nutrition, accident prevention, and specific care and rearing of the child at various stages of development. The recommended preventive health care schedule for children who are developing normally is at months 1, 2, 4, 6, 9, 12, 15, 18, and 24 and at years 3, 4, 5, 8, 10, 12, 14, 16, and 18. Well baby care may be provided in a clinic, a convenient local meeting place, a private doctor's office, the office of a community health nursing service, or a school. Nurses or nurse practitioners frequently provide the care.

well baby clinic, a clinic that specializes in medical supervision and services for healthy infants.

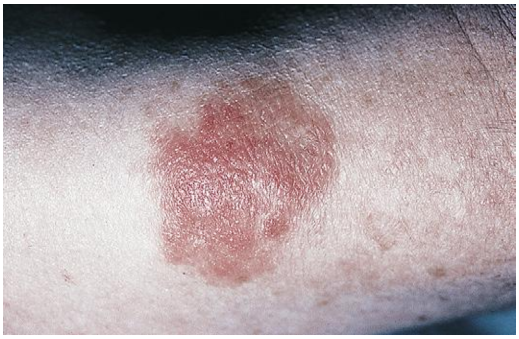
well-being [AS, *wyllan* + *beon,* to be], achievement of a good and satisfactory existence as defined by the individual.

well-differentiated lymphocytic malignant lymphoma /-dif′əren′shē·ā′tid/, a lymphoid neoplasm characterized by the predominance of mature lymphocytes. Also called **lymphocytic lymphoma, lymphocytic lymphosarcoma, lymphocytoma.**

Wellens' syndrome, the electrocardiographic signs of critical proximal left anterior descending coronary artery stenosis in patients with unstable angina. The signs are: normal or minimally elevated enzyme; little or no S-T segment elevation; no loss of precordial R waves; and progressive, deep, symmetric inversion of the T waves in leads V2 and V3, and sometimes in other leads. The signs are seen when the patient is without pain and represent reperfusion following transient occlusion.

wellness, a dynamic state of health in which an individual progresses toward a higher level of functioning, achieving an optimum balance between internal and external environments.

Wells' syndrome /welz/ [G.C. Wells, British dermatologist, 20th century], cellulitis with erythema, edema, and often blistering of the skin accompanied by eosinophilia,



Wells' syndrome *(Callen et al, 2000)* flame figures, and a mild fever. A single episode lasts 2 to 6 weeks, and recurrences or exacerbations are common. Also called **eosinophilic cellulitis.**

welt [OE, *wealtan,* to roll], a raised ridge on the skin, usually caused by a blow, or occurring in dermatographism.

wen. See **pilar cyst.**

Wenckebach heart block. See **Mobitz I heart block.**

Werdnig-Hoffmann disease /verd′nig hôf′mun/ [Guido Werdnig, Austrian neurologist, 1844–1919; Johann Hoffmann, German neurologist, 1857–1919], a genetic disorder beginning in infancy or young childhood, characterized by progressive atrophy of the skeletal muscle resulting from degeneration of the cells in the anterior horn of the spinal cord and the motor nuclei in the brainstem. Onset occurs within the first year of life, with the condition usually apparent at birth. Symptoms include congenital hypotonia; absence of stretch reflexes; flaccid paralysis, especially of the trunk and limbs; lack of sucking ability; fasciculations of the tongue and sometimes of other muscles; and often, dysphagia. Treatment is symptomatic, and death generally occurs in early childhood, often from respiratory complications. The condition is transmitted as an autosomal-recessive trait and occurs more frequently in siblings than in successive generations. Also called **familial spinal muscular atrophy, Hoffmann's atrophy, infantile spinal muscular atrophy, progressive spinal muscular atrophy of infants, Werdnig-Hoffmann paralysis.** See also **floppy infant syndrome.**

Werlhof's disease, Not in common usage. See **immune thrombocytopenic purpura.** Not in common usage.

Werner's syndrome /wur′nərz, wer′nərz/, an inherited condition of progeria with scleroderma, juvenile cataracts, diabetes mellitus, and hypogonadism.

Wernicke-Korsakoff syndrome, the coexistence of Wernicke's encephalopathy and Korsakoff's syndrome.

Wernicke's aphasia /ver′nikēz/ [Karl Wernicke, German neurologist, 1848–1905], a form of aphasia affecting comprehension of written and spoken words, possibly caused by a lesion in Wernicke's center. The patient may articulate normally, but speech is incoherent, with malformed or substitute words and grammatical errors. Compare **Broca's aphasia.**

Wernicke's center [Karl Wernicke; Gk, *kentron,* center], a sensory speech center located in the posterior temporal gyrus and adjacent angular gyrus in the dominant hemisphere. Wernicke observed in 1874 that patients with brain damage in that area also suffered a loss of speech comprehension. Also called **Wernicke's field, Wernicke's zone.** See also **speech centers.**

Wernicke's encephalopathy [Karl Wernicke], an inflammatory, hemorrhagic, degenerative condition of the brain. It is characterized by lesions in several parts of the brain, including the hypothalamus, mammillary bodies, and tissues surrounding the ventricles and aqueducts, double vision, ophthalmoplegia, involuntary and rapid movements of the eyes, lack of muscular coordination, and decreased mental function, which may be mild or severe. Wernicke's encephalopathy is caused by a thiamine deficiency and is seen in association with chronic alcoholism. It also occurs as a complication of GI tract disease and hyperemesis gravidarum associated with malabsorption and malnutrition. Also called **Wernicke's syndrome.**

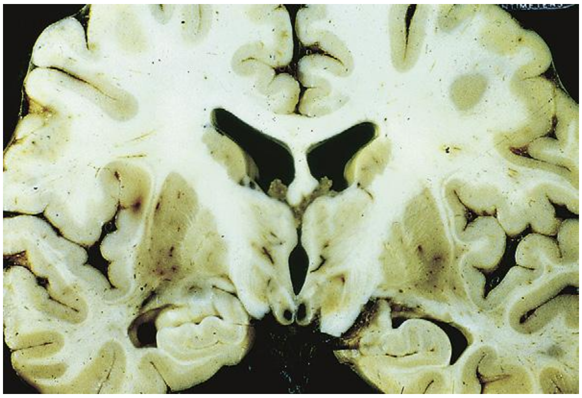
Wernicke's field. See **Wernicke's center.**

Wernicke's syndrome. See **Wernicke's encephalopathy.**

Wernicke's zone. See **Wernicke's center.**

West African sleeping sickness. See **Gambian trypanosomiasis.**

Westcort, a trademark for a glucocorticoid (hydrocortisone valerate).



Wernicke's encephalopathy
(Kumar, Cotran, and Robbins, 2003)

Westermark's sign [Neil Westermark, German radiologist, b. 1904], on a radiograph of the lung, the absence of blood vessel markings beyond the location of a pulmonary embolism.

Western blot test, a laboratory blood test to detect the presence of antibodies to specific antigens. It is regarded as more precise than the enzyme-linked immunosorbent assay (ELISA) and is sometimes used to check the validity of ELISA tests.

western equine encephalitis. See **equine encephalitis.**

West Indian smallpox. See **alastrim.**

West Nile encephalitis /west nīl/ [West Nile River valley and region in northern Uganda, where the disease was first observed in 1937], a mild, febrile, sporadic disease caused by the West Nile virus, transmitted by *Culex* mosquitoes and occurring chiefly in the summer; infection often does not lead to encephalitis. It may be of sudden onset, and symptoms may include drowsiness, severe frontal headache, maculopapular rash, abdominal pain, loss of appetite, nausea, and generalized lymphadenopathy. Most people infected with West Nile encephalitis are asymptomatic or experience flulike symptoms. Care is supportive. Many recover quickly but may experience prolonged malaise. Also called **West Nile fever.**

West Nile fever. See **West Nile encephalitis.**

West Nile virus /west nīl/, a virus of the genus *Flavivirus* that causes West Nile encephalitis. It is transmitted by *Culex* mosquitoes, with wild birds serving as the reservoir, and occurs widely in Africa, Europe, the Middle East, and Asia; it has recently been reported in the United States.

West Nile virus testing, a test of the blood or cerebrospinal fluid to identify the West Nile antibody.

West nomogram, a graph used in estimating the body surface area. See also **nomogram.**

West's syndrome, an infantile encephalopathy characterized by spasms, arrest of psychomotor development, and an electroencephalogram abnormality of random high-voltage slow waves and spikes from multiple loci.

wet-and-dry-bulb thermometer, an instrument used to measure the relative humidity of the atmosphere. It consists of a thermometer with a bulb that is wet or moist and one that is kept dry. The relative humidity is calculated from the difference in readings of the thermometers when water evaporates from the wet bulb, decreasing its temperature.

wet cough. See **productive cough.**

wet dream. See **nocturnal emission.**

wet dressing [AS, *waet* + Ofr, *dresser,* to arrange], a moist dressing used to relieve symptoms of some skin diseases. As the moisture evaporates, it cools and dries the skin, softens dried blood and sera, and stimulates drainage. Medication may be added if necessary.

wet lung. See **adult respiratory distress syndrome.**

wet nurse, a woman who cares for and breastfeeds another's infant.

wet pack [AS, *waet,* moist; ME, *pakke*], a therapy that involves wrapping the patient in wet sheets with a top covering of a dry blanket, usually to reduce fever.

wet pleurisy [AS, *waet* + Gk, *pleuritis*], pleurisy in which the inflammation has progressed to an effusive state. The escaped fluid has a high specific gravity because of the presence of blood clots and fibrin.

wet tap, accidental puncture of the dura mater during injection of epidural anesthesia, so-called from the leakage of cerebrospinal fluid from the needle hub.

wetting agent, **1.** a substance that lowers the surface tension of water to promote wetting. **2.** a detergent such as tyloxapol used as a mucolytic in respiratory therapy.

wet to dry dressing, a wet dressing that is allowed to dry and then is removed. In removal it lightly debrides the wound.

W/F, abbreviation for *white female,* often used in the initial identifying statement in a patient record.

Wharton's duct. See **submandibular duct.**

Wharton's jelly /wôr′tənz/ [Thomas Wharton, English anatomist, 1614–1673; L, *gelare,* to congeal], a gelatinous mesenchymal tissue that remains when the embryonic body stalk blends with the yolk sac within the umbilical cord.

wheal /wēl/ [AS, *walu,* pimple], smooth, slightly elevated area on the skin that is redder or paler than the surrounding skin. A wheal usually itches and can change size or shape or disappear within hours. It is the typical lesion of urticaria.

wheal-and-flare reaction [AS, *walu* + *flare* + ME, *fleare,* to blaze up; L, *re,* again, *agere,* to act], a skin eruption that may follow injury or injection of an antigen. It is characterized by swelling and redness caused by a release of histamine. The reaction usually occurs in three stages, beginning with the appearance of an erythematous area at the site of injury, followed by development of a flare surrounding the site; finally a wheal forms at the site as fluid leaks under the skin from surrounding capillaries.

wheat weevil disease, a hypersensitivity pneumonitis caused by allergy to weevil particles found in wheat flour.

wheel, **1.** a rigid circular frame designed to revolve about an axis in the center of the disk. **2.** a round cutting or polishing dental instrument.

wheelchair (wc), a mobile chair equipped with large wheels and brakes. If long-term use of the chair is expected, a physical therapist may prescribe certain personalized requirements, such as size, left- or right-hand propulsion, type of brakes, height of armrests, and special seat pads.

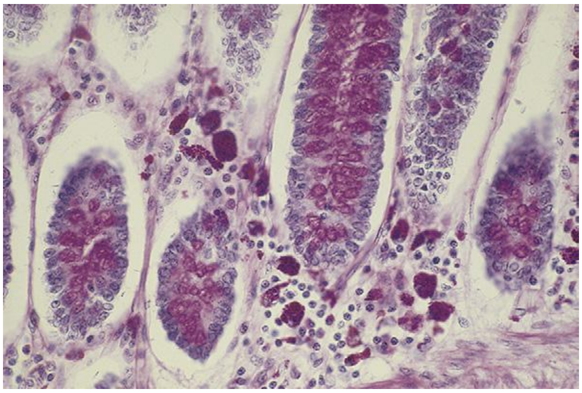
wheelie /wē′lē/, a wheelchair mobility skill in which the front casters are raised and balance is maintained over the large rear wheels. It is used for negotiating steep ramps, steps, curbs, and other rough terrain.

wheeze [AS, *hwesan,* to hiss], **1.** a form of rhonchus, characterized by a high-pitched or low-pitched musical quality. It is caused by a high-velocity flow of air through a narrowed airway and is heard during both inspiration and expiration. It may be caused by bronchospasm, inflammation, or obstruction of the airway by a tumor or foreign body. Wheezes are associated with asthma and chronic bronchitis. Unilateral wheezes are characteristic of bronchogenic carcinoma, foreign bodies, and inflammatory lesions. In asthma, expiratory wheezing is more common, although inspiratory and expiratory wheezes are heard. **2.** to breathe with a wheeze. Compare **crackle, rhonchus.**

whiplash injury [ME, *whippen* + *lasshe* + L, *ijuria*], *(informal)* an injury to the cervical vertebrae or their supporting ligaments and muscles marked by pain and stiffness. It usually results from sudden acceleration or deceleration, such as in a rear-end car collision that causes violent back-and-forth movement of the head and neck.

Whipple procedure /hwip′əl/ [Allen O. Whipple, American surgeon, 1881–1963], radical pancreaticoduodenectomy with removal of the distal third of the stomach, the entire duodenum, and the head of the pancreas, a portion of the jejunum, and the lower half of the common bile duct, with gastrojejunostomy, choledochojejunostomy, and pancreaticojejunostomy. See also **pancreaticoduodenectomy.**

Whipple's disease [George Hoyt Whipple, American pathologist, 1878–1976], a rare intestinal disease characterized by severe intestinal malabsorption, steatorrhea, anemia, weight loss, arthritis, and arthralgia. People with the disease are severely malnourished and have abdominal pain, chest pain, and a chronic nonproductive cough. The diagnosis is made by jejunal biopsy. Penicillin and tetracycline may alleviate the symptoms. See also **malabsorption syndrome.**



Whipple's disease *(Kumar, Abbas, and Fausto, 2005)*

whipworm. See ***Trichuris.***

whirlpool bath /(h)wurl/, the immersion of the body or a part of the body in a tank of warm water agitated by a jet of equally hot water and air, often used to clean infected wounds.

Whirlpool bath *(Elkin, Perry, and Potter, 2007)*

whistling face syndrome, whistling face-windmill vane hand syndrome. See **Freeman-Sheldon syndrome.**

Whitaker test, (for resistance of ureters) a pressure-flow study measuring resistance of the ureters to a given flow rate of urine by antegrade pyelography of the renal pelvis and a catheter in the bladder.

white blood cell. See **leukocyte.**

white blood cell cast, a hyaline cast that contains white blood cells, such as in tubulointerstitial nephritis, pyelonephritis, or glomerulonephritis. Also called *leukocyte cast*.

white blood cell (WBC) count and differential count, a two-component blood test that first counts the total number of WBCs (leukocytes) in 1 cubic millimeter of peripheral venous blood and then measures the percentage of each type of leukocyte present in the same specimen (the differential count). The WBC and differential count are routinely measured as part of a complete blood count and, when done serially, have both diagnostic and prognostic value.

white blood cell scan, a nuclear scan to identify and localize an area of inflammation or infection. The scan is performed 4 to 24 hours after the white blood cells are separated from blood drawn from the patient, labeled with technetium or indium, and reinjected.

white cell, *(informal)* white blood cell. See also **leukocyte.**

white corpuscle. See **leukocyte.**

white damp. See **damp.**

white fibrocartilage [AS, *hwit* + L, *fibra,* fiber, *cartilago*], a mixture of tough, white fibrous tissue and flexible cartilaginous tissue. It is divided into four types: interarticular fibrocartilage, connecting fibrocartilage, circumferential fibrocartilage, and stratiform fibrocartilage. Compare **hyaline cartilage, yellow cartilage.**

white gold, a gold alloy with a high content of palladium or platinum used in dental restorations, such as prepared tooth cavities and gold crowns. It has a higher fusion range, lower ductility, and greater hardness than a yellow gold alloy.

whitehead. See **comedo.**

white infarct. See **pale infarct.**

white leg. See **phlegmasia alba dolens.**

white line. See **linea alba.**

white matter, the tissue of the central nervous system and much of the part of the cerebrum, consisting mainly of myelinated nerve fibers, but with some unmyelinated nerve fibers, embedded in a spongy network of neuroglia. It is subdivided in each half of the spinal cord into three funiculi: the anterior, the posterior, and the lateral white column. Each column subdivides into tracts that are closely associated in function. The anterior column divides into two ascending tracts and five descending tracts. The posterior column divides into two large ascending tracts, one small descending tract, and one intersegmental tract. The lateral column divides into six ascending tracts and four descending tracts. Also called **white substance.** Compare **gray matter.** See also **cerebrum, spinal cord, spinal tract.**

white noise, a sound in which the intensity is the same at all frequencies within a designated band.

white piedra. See **trichosporosis.**

whitepox. See **alastrim.**

white radiation, a form of radiation that results from the rapid deceleration of high-speed electrons striking a target, as occurs when the electron beam of a tungsten cathode strikes the tungsten or molybdenum target of the anode in an x-ray tube. Most of the x-rays emitted from a diagnostic or therapeutic x-ray unit represent white radiation. Also called **bremsstrahlung radiation.**

white ramus communicans, the communicating nerve branch between sympathetic ganglions and spinal nerves that is largely myelinated and located mainly in the thoracic and upper lumbar region.

white spot disease. See **lichen sclerosis et atrophicus.**

white spots film fault, a defect in a radiograph or photograph that appears as scattered white spots throughout the image area. It is caused by air bubbles clinging to the emulsion during development or by fixing solution splattered on the film before processing.

white substance. See **white matter.**

white thrombus, a clot composed of some combination of blood platelets, fibrin, clotting factors, and white blood cells but containing few or no erythrocytes.

white willow bark, a preparation of the bark of various *Salix* species native to central and southern Europe and collectively known as white willow, containing salicin, a precursor of salicylic acid, to which it is converted metabolically. It is used as an antiinflammatory and antipyretic.

whitlow /(h)wit′lō/ [Scand, *whick,* nail, *flaw,* crack], an inflammation of the end of a finger or toe that results in suppuration. See also **felon.**

WHO, abbreviation for **World Health Organization.**

WHO classification of lymphoid neoplasms, a classification of lymphomas, descended from the REAL classification, that divides them into three main categories (B-cell neoplasms, T-cell neoplasms, and Hodgkin's lymphoma) based on morphology, immunophenotype, and genetic abnormalities.

whole blood /hōl/ [AS, *hal* + *blod*], donor blood that is unmodified except for the presence of an anticoagulant. Whole blood is rarely used for transfusion because it is typically separated into red cells, plasma, or other components after collection.

whole body dose, a measure of radiation exposure, equal to the total amount of ionizing radiation absorbed by the body divided by the body's mass. It is meaningful only for fairly uniform irradiation over the entire body. See also **effective dose.**

whole-body irradiation, ionizing radiation exposure that affects the entire body. Short-term whole-body irradiation can cause injury or death in humans, mainly from damage to the GI tract and the bone marrow. However, such injury occurs only with doses far beyond the diagnostic range, such as with exposure to nuclear weapons. The absorbed dose equivalent limit for whole-body occupational exposure is 5 rem per year. The nonoccupational absorbed dose equivalent limit is 0.5 rem per year. Also called **total body radiation.**

whole bowel irrigation, a method of treating poisoned patients by flushing large volumes of fluid through the GI tract.

whole milk, cow's milk from which no constituent such as fat has been removed. To be called whole milk it must contain 3.5% fat, 8.5% nonfat milk solids, and 88% water.

whoop /ho͞op, (h)wo͞op/, a noisy spasm of inspiration that terminates a coughing paroxysm in cases of pertussis. It is caused by a sudden sharp increase in tension on the vocal cords.

whooping cough. See **pertussis.**

whorl /(h)wurl/ [ME, *hwarwy*], a spiral turn, such as one of the turns of the cochlea or of the dermal ridges that form fingerprints.

WIA, abbreviation for **waking imagined analgesia.**

wick humidifier, a respiratory care device in which a piece of paper, sponge, or similar material that absorbs water by capillary action is inserted in the path of the airflow. With the addition of heat, high levels of humidity can be achieved over a wide range of flows and temperatures.

Widal's test /vēdäls′/ [Georges F. I. Widal, French physician, 1862–1929], an agglutination test used to aid in the diagnosis of *Salmonella* infections such as typhoid fever. This test measures the level of cold or febrile agglutinins in the blood that causes red blood cells to stick together at low or high temperatures. A fourfold increase in titer of agglutinins to O or H antigens is highly suggestive of active infection. A high titer may persist for years after the disease or after immunization against typhoid fever.

wide-angle glaucoma. See **glaucoma.**

wide area network (WAN), a computer network that uses long-distance communications methods, such as telephone lines, satellite links, or microwave transmission, to cover a geographic area larger than that which can be covered by a local area network (LAN).

Wiedenbach, Ernestine /wē′dənbak/, (1900-1996) a German-born American nursing educator and writer. She taught maternal and newborn health nursing at Yale School of Nursing, was a leader in family-centered maternity nursing, and developed the full range of the art and science of obstetric nursing.

Wiener, Carolyn L., a nursing theorist who, with Marylin J. Dodd, developed the Theory of Illness Trajectory, which involves not only the patient but the family and caregivers. The theory helps elucidate how patients and families tolerate the states of uncertainty caused by the illness and manage the illness.

Wigraine, a trademark for a vasoconstrictor **(ergotamine tartrate).**

wild-type allele [AS, *wilde,* untamed; Gk, *typos,* mark, *genein,* to produce], a normal or standard form of a gene, as contrasted with a mutant form.

wild-type virus, street virus.

will [AS, *wyllan*], **1.** the mental faculty that enables one to consciously choose or decide on a course of action. **2.** the act or process of exercising the power of choice. **3.** a wish, desire, or deliberate intention. **4.** a disposition or attitude toward another or others. **5.** determination or purpose; willfulness. **6.** (in law) an expression or declaration of a person's wishes as to the disposition of property to be performed or take effect after death. Also called **volition.**

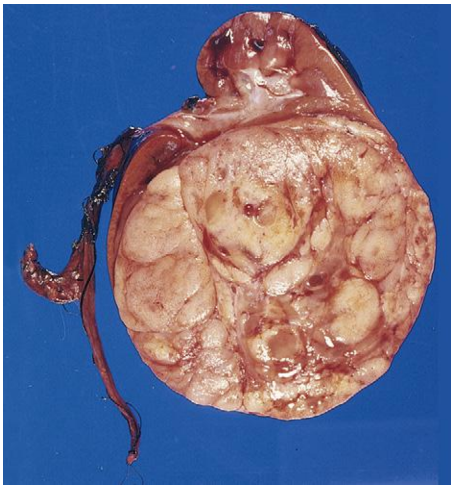
Williams syndrome /wil′yəmz/ [J.C.P. Williams, New Zealand cardiologist, 20th century], supravalvular aortic stenosis, mental retardation, elfin facies, and transient hypercalcemia in infancy. Also called **elfin facies syndrome.**

Willis' circle. See **circle of Willis.**

willow fracture. See **greenstick fracture.**

will to live, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as desire, determination, and effort to survive. See also **Nursing Outcomes Classification.**

Wilms' tumor /vilms/ [Max Wilms, German surgeon, 1867–1918], a malignant neoplasm of the kidney occurring in young children before the fifth year in 75% of the cases. It is slightly more common among females than males and among African-American children than Caucasian children. The most frequent early signs are hypertension, a palpable mass, pain, and hematuria. Diagnosis can be established by an excretory urogram with tomography. The tumor, an embryonal adenomyosarcoma, is well encapsulated in the early stage, but it may extend into lymph nodes, the renal vein, or the vena cava and metastasize to the lungs or other sites. Removal of resectable tumors by transperitoneal nephrectomy is recommended. Radiotherapy is used before or after surgery or palliatively in inoperable cases. Chemotherapy combined with surgery and irradiation is proving highly effective. Also called **adenomyosarcoma, nephroblastoma.** See also **kidney cancer.**



Wilms' tumor *(Kumar et al, 2007)*

Wilson's disease [Samuel A. K. Wilson, English neurologist, 1878–1937], a rare inherited disorder whereby a decrease in ceruloplasmin causes copper to accumulate slowly in the liver, to then be released, and to be taken up in other parts of the body. Hemolysis and hemolytic anemia occur as the copper accumulates in the red blood cells. Accumulation in the brain destroys certain tissue and may cause tremors, muscle rigidity, poorly articulated speech, and dementia. Kidney function is diminished. The liver becomes cirrhotic. Treatment of Wilson's disease includes a reduction of copper in the diet and the prescription of copper-binding agents and penicillamine. Also called **hepatolenticular degeneration.**

Winckel's disease [Franz Von Winckel, German gynecologist, 1837-1911], a fatal disease of the newborn caused by colon bacilli entering the stump of the umbilical cord. Characterized by hematuria, jaundice, enlarged spleen, collapse, and convulsions. See also **hemoglobinuria.**

windburn /wind′burn/ [AS, *wind,* air, *baernan*], a skin disorder caused by exposure to winds.

windchill /win′chil/, the loss of heat from the body when it is exposed to wind of a given speed at a given temperature and humidity.

windchill factor [AS, *wind,* air, *cele,* cold], the amount of chilling of the body, beyond that resulting from a cold ambient temperature, because of exposure to cool air currents. The windchill factor is expressed in degrees Celsius or Fahrenheit as the effective temperature felt by a person exposed to the weather. Because windchill factors are based on exposure of dry skin to cool air currents, air blowing at the same speed over a wet skin surface would cause additional loss of body heat and a greater windchill.

windchill index, a chart that compares temperatures of the atmosphere with various wind speeds, enabling one to calculate the windchill factor. The comparison is expressed in kilocalories per hour per square meter of skin surface.

winding sheet /wīn′ding/, a shroud for wrapping a dead body.

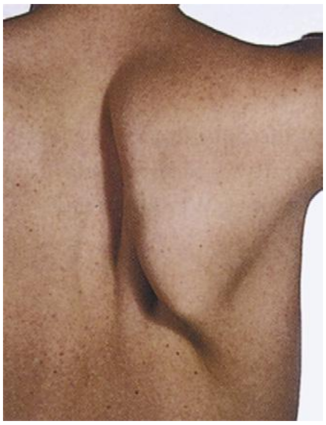
window [AS, *wind,* air, *owe,* eye], **1.** a surgically created opening in the surface of a structure or an anatomically occurring opening in the surface or between the chambers of a structure. **2.** a specific time period during which a phenomenon can be observed, a reaction monitored, or a procedure initiated.

windowed /win′dōd/, referring to an orthopedic cast that has an opening designed to relieve pressure that may irritate and inflame the skin or to provide access to an incision or a wound.

windpipe. See **trachea.**

winegrower's lung /wīn′grō·ərs/, a type of hypersensitivity pneumonitis caused by contact with mold on grapes.

winged scapula /wingd/ [ONorse, *vaengr* + L, *scapulae,* shoulderblades], an abnormal prominence of the scapula caused either by projection of posterior angles of the ribs in a flat chest or by paralysis of the serratus anterior muscle.



Winged scapula *(Perkin et al, 2011)*

wink reflex, an automatic closure of the eyelids in response to an appropriate stimulus. Also called **eye-closure reflex.**

Winstrol, a trademark for an androgen **(stanozolol)** used as an anabolic agent.

winter cough [AS, *winter* + *cohhetan*], *nontechnical.* a chronic condition characterized by a persistent cough occasioned by cold weather. See also **cough.**

wintergreen oil, a volatile oil with a characteristic odor and taste; used as a counterirritant in ointments or liniments for muscle pain and also as a flavoring agent. Also called **methyl salicylate.**

winter itch, pruritus occurring in cold weather in people who have dry skin, particularly in those who have atopic dermatitis. Warmer temperature, increased humidity, and topical, antipruritic emollients may offer relief.

wire /wīr/, **1.** *n.,* a long, slender, flexible structure of metal, used in surgery and dentistry. **2.** *v.,* to insert such metal strands into a body structure, as into a broken bone to immobilize fragments.

wire suture [AS, *wir* + L, *sutura*], a stainless steel or silver wire used for uniting bone fracture fragments or in dentistry.

wiry pulse /wī′(ə)re/ [AS, *wir* + L, *pulsare,* to beat], an abnormal pulse that is strong but small.

wisdom tooth [AS, *wisdom* + *toth*], a third molar; either of the last teeth on each side of the upper and lower jaw. The wisdom teeth are the last teeth to erupt, usually between 17 and 25 years of age, often causing considerable pain, dental problems, and the need for extraction. Formerly called **dens serotinus.** See also **molar.**

wish fulfillment [AS, *wiscan,* to wish, *fullfyllan,* to fulfill], **1.** the gratification of a desire. **2.** (in psychology) the satisfaction of a desire or the release of emotional tension through such processes as dreams, daydreams, and neurotic symptoms. **3.** (in psychoanalysis) one of the primary motivations for dreams in which an unconscious desire or urge, unacceptable to the ego and superego because of sociocultural restrictions or feelings of personal guilt, is given expression.

wishful thinking [AS, *wiscan* + *thencan,* to think], the interpretation of facts or situations according to one's desires or wishes rather than as they exist in reality, usually used as an unconscious device to avoid painful or unpleasant feelings.

Wiskott-Aldrich syndrome /wis′ko tôl′drich/ [Alfred Wiskott, German pediatrician, 1898–1978; Robert Anderson Aldrich, American pediatrician, b. 1917], an immunodeficiency disorder inherited as a recessive X-linked trait, characterized by thrombocytopenia, eczema, inadequate T and B cell function, and an increased susceptibility to viral, bacterial, and fungal infections and to cancer. Treatment includes the prescription of appropriate antibiotics for specific infectious organisms and the administration of transfer factor from activated lymphocytes to increase the resistance to infection and to clear the eczema. See also **transfer factor.**

witch doctor, a shamanistic healer whose primary function is to cure the sick members of the community.

witch hazel [AS, *wican,* to bend; Ger, *hasel*], **1.** a shrub, *Hamamelis virginiana,* indigenous to North America, from which an astringent extract is derived. **2.** also called **hamamelis water.** A solution comprising the extract, alcohol, and water, used as an astringent.

witch's milk, a milklike substance secreted from the breast of the newborn, caused by circulating maternal lactating hormone. Also called **hexenmilch.**

withdrawal /withdrô′əl/ [ME, *with* + *drawen,* to take away], a common response to physical danger or severe stress characterized by a state of apathy, lethargy, depression, retreat into oneself, and in grave cases, catatonia and stupor. It is pathological if it interferes with a person's perception of reality and ability to function in society, such as in the various forms of schizophrenia. See also **schizophrenia.**

withdrawal behavior, the physical or psychological removal of oneself from a stressor.

withdrawal bleeding, the passage of blood from the uterus, associated with the shedding of endometrium that has been stimulated and maintained by hormonal medication. It occurs when the medication is discontinued. In the endocrine evaluation of a woman with amenorrhea, withdrawal bleeding constitutes evidence that the woman's endometrium is responsive to hormonal stimulation and that the cause of her amenorrhea is probably not uterine.

withdrawal method, a contraceptive technique in coitus wherein the penis is withdrawn from the vagina before ejaculation. It is not reliable because small amounts of seminal fluid carrying millions of spermatozoa may be emitted without sensation before full ejaculation. Also called **coitus interruptus.**

withdrawal reflex. See **flexor withdrawal reflex.**

withdrawal symptoms, the unpleasant, sometimes life-threatening physiological changes that occur when some drugs are withdrawn after prolonged, regular use. The effects may occur after use of an opioid, antipsychotic, stimulant, sedative-hypnotic, alcohol, corticosteroid, or other substance to which the person has become physiologically or psychologically dependent or addicted. Other drug therapy may be used to relieve symptoms of withdrawal, such as methadone used for heroin withdrawal, or chlordiazepoxide, used for alcohol withdrawal. Withdrawal symptoms can also be managed with a planned schedule of tapering the drug dose by gradually reducing the dosage over time, as with the tapering of corticosteroids.

withdrawal syndrome [ME, *with* + *drawen,* to take away; Gk, *syn,* together, *dromos,* course], a physical and mental response after cessation or severe reduction in intake of a substance such as alcohol or opiates that has been used regularly to induce euphoria, intoxication, or relief from pain or distress. The body tissues become dependent on the regular reinforcing effect of the chemical so that interruption of the dosage induces an organic mental state characterized by anxiety, restlessness, insomnia, irritability, impaired attention, and often physical illness. Also called **abstinence syndrome.**

withdrawn behavior, a condition in which there is a blunting of the emotions and a lack of social responsiveness.

witness, a person who is present and can testify that he or she has personally observed an event, such as the signing of a will or consent form.

Wittmaack-Ekbom syndrome. See **restless legs syndrome.**

W/M, abbreviation for *white male,* often used in the initial identifying statement in a patient record.

WMD, abbreviation for **weapons of mass destruction.**

WOB, abbreviation for **work of breathing.**

wobble /wob′əl/, an eccentric rotation that permits increased resolution of tomographic imaging devices composed of discrete detector systems. Typical eccentric excursions are 1 to 2 cm.

WOCN, an abbreviation for *Wound, Ostomy and Continence Nurses*. See **Wound, Ostomy and Continence Nurses Society.**

Wohlfart-Kugelberg-Welander disease. See **juvenile spinal muscular atrophy.**

Wolbachia /wol-bak′e-ah/, a genus of bacteria that infect a wide variety of invertebrates, including insects, spiders, crustaceans, and nematodes.

Wolff-Chaikoff effect /wo͝olf′ chī′kəf/, the decreased formation and release of thyroid hormone in the presence of an excess of iodine.

wolffian body. See **mesonephros.**

wolffian cyst /wôl′fē·ən/ [Kaspar F. Wolff, German anatomist, 1733–1794; Gk, *kystis,* bag], **1.** a cyst of the wolffian duct. **2.** a cyst of a broad ligament of the uterus.

wolffian duct. See **mesonephric duct.**

Wolff-Parkinson-White syndrome /wo͝olf′ pär′kinsən-(h) wīt′/ [Louis Wolff, American physician, 1898–1972; John Parkinson, English cardiologist, 1885–1976; Paul Dudley White, American cardiologist, 1886–1973], a disorder of atrioventricular (AV) conduction involving an accessory pathway. This syndrome is often identified by a characteristic delta wave seen on an electrocardiogram at the beginning of the QRS complex. It is amenable to radiofrequency ablation. See also **Lown-Ganong-Levine syndrome.**

Wolff's law /wôlfs/ [Julius Wolff, German anatomist, 1836–1902], the principle that changes in the form and function of a bone are followed by changes in its internal structure.

Wolf-Herschorn syndrome, a genetic disorder of infants characterized by psychomotor and growth retardation, hypertonicity, seizures, and microcephaly. Other features include craniofacial anomalies, ocular malformations, cleft lip or palate, heart malformations, and scoliosis.

wolfram. See **tungsten.**

Wolfram syndrome /wool′frəm/ [D.J. Wolfram, American physician, 20th century], an autosomal-recessive syndrome, first evident in childhood, consisting of diabetes mellitus, diabetes insipidus, optic atrophy, and neural deafness. Also called **DIDMOAD syndrome.**

Wolman's disease. See **cholesteryl ester storage disease.**

woman, an adult female human.

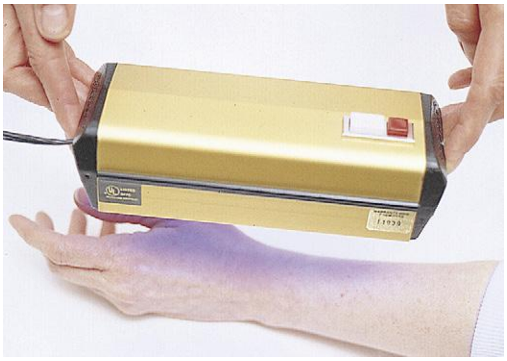
woman-year [AS, *wifman* + *gear*], (in statistics) 1 year in the reproductive life of a sexually active woman; a unit that represents 12 months of exposure to the risk of pregnancy. Woman-years are used in calculating a pregnancy rate in the assessment of the effectiveness of the various methods of family planning and of the adverse effect on the birthrate of various environmental factors.

womb. See **uterus.**

wood alcohol. See **methanol.**

wood creosote, that obtained by distilling wood tar, mainly beech *(Fagus sylvatica)*. It is a colorless to yellowish, oily, refractive liquid composed mainly of the phenol derivatives guaiacol and creosol. It was formerly used as an expectorant and external antiseptic but is now rarely used in the United States.

Wood's lamp [Robert W. Wood, American physicist, 1868–1955; AS, *glaes*], an illuminating device with a nickel oxide filter that holds back all light except for a few violet rays of the visible spectrum and ultraviolet wavelengths of about 365 nm. It is used extensively to help diagnose fungus infections of the scalp and erythrasma. The light causes hairs infected with a fungus such as *Tinea capitis* to become brilliantly fluorescent. Also called **black light.**



Wood's lamp *(Wilson and Giddens, 2009)*

Wood's light. See **ultraviolet lamp.**

wood tick [AS, *wudu* + ME, *tike*], a hardshelled tick of the Ixodidae family and a natural reservoir of *Rickettsia rickettsii*. One species of wood tick, *Dermacentor andersoni,* is the principal vector in western North America of **Rocky Mountain spotted fever,** transmitted by *R. rickettsii*.

wool fat, a fatty substance obtained from sheep's wool and of which lanolin is a common chemical component. It consists primarily of lanosterol and cholesterol and its esters.

woolsorter's disease [AS, *wull* + Fr, *sorte* + L, *dis,* opposite of; Fr, *aise,* ease], the pulmonary form of anthrax, so named because it is an occupational hazard to those who handle sheep's wool. Early symptoms mimic those of influenza, but the patient soon develops high fever, respiratory distress, and cyanosis. If the disease is not treated at this stage, it is often fatal. Also called **pulmonary anthrax.** See also **anthrax.**

word association. See **controlled association.**

word association test. See **association test.**

word blindness [AS, *word* + *blind*], an inability to understand written language. A form of receptive aphasia caused by lesions in the parietal or parietal-occipital areas of the brain. The condition may be congenital or acquired as a result of disease or injury. Also called **alexia.** Compare **dyslexia.**

word deafness. See **auditory amnesia.**

word processor, a computer software application designed for the keyboarding, formatting, correcting, and storing of text, including correspondence, reports, manuscripts, and books or other publications.

word salad, a jumble of words and phrases that lacks logical coherence and meaning, often characteristic of disoriented individuals and persons with schizophrenia. See also **jargon aphasia.**

work hardening, a highly structured, goal-oriented, individualized treatment program designed to maximize a person's ability to return to work. Work hardening uses work (real or simulated) as a treatment modality.

working occlusion [AS, *weorc* + L, *occludere*, to shut], the occlusal contacts of teeth on the side of the jaw toward which the mandible is moved.

working phase, (in psychology) the second stage of the therapist-client relationship. During this stage clients explore their experiences. Therapists assist clients in this process by helping them to describe and clarify their experiences, to plan courses of action and try out the plans, and to begin to evaluate the effectiveness of their new behavior. Should new behavior prove ineffective, therapists can assist clients in revising their courses of action.

working pressure, the recommended pressure, usually about 34 Pa (50 p.s.i.), for oxygen or compressed air leaving a cylinder. It is reduced by a pressure regulator for clinical use in respiratory therapy.

working through, a process by which repressed feelings are released and reintegrated into the personality.

workload, an amount of work to be performed within a specific time period.

work of breathing (WOB), the effort required to inspire air into the lungs. WOB accounts for 5% of total body oxygen consumption in a normal resting state but can increase dramatically during acute illness.

work of worrying, a coping strategy in which inner preparation through worrying increases the level of tolerance for subsequent threats.

workout, **1.** a test of ability and endurance. **2.** a physical exercise session.

work simplification, the use of special equipment, ergonomics, functional planning, and behavior modification to reduce the physical and psychological stresses of home maintenance for disabled people or their family members.

workstation, **1.** an area, as in an office, equipped with a computer or computer terminal. **2.** an electronic monitor, such as a computer or television screen, with controls for manipulating images.

work therapy [AS, *weorc* + Gk, *therapeia*, treatment], a therapeutic approach in which the client performs a useful activity or learns an occupation, as in occupational therapy.

work tolerance, the kind and amount of work that a physically or mentally ill person can or should perform.

work-up, the process of performing a complete patient evaluation, including history, physical examination, laboratory tests, and x-ray or other diagnostic procedures to acquire an accurate database on which a diagnosis and treatment plan may be established.

World Health Organization (WHO), an intergovernmental organization within the United Nations system whose purpose is to aid in the attainment of the highest possible level of health by all people. Programs include education for current health issues, proper food supply and nutrition, safe water and sanitation, maternal and child health, immunization against major infectious diseases, and prevention and control of diseases. WHO is coordinating global strategies to control and prevent acquired immunodeficiency syndrome. Its functions include furnishing technical assistance, stimulating and advancing epidemiological investigation of diseases, recommending health regulations, promoting cooperation among scientific and professional health groups, and providing information and counsel relating to health matters. Its headquarters are in Geneva, Switzerland.

worm /wurm/ [AS, *wyrm*], any of the soft-bodied, elongated invertebrates of the phyla Annelida, Nemathelminthes, or Platyhelminthes. Some kinds of worms parasitic for humans are **hookworm, pinworm,** and **tapeworm.** See also **fluke, roundworm.**

wormian bone /vôr′mē·ən/ [Olaus Worm, Danish anatomist, 1588–1654; AS, *ban*], any of several tiny smooth bones, usually found at the serrated borders of the sutures between the cranial bones.

worthlessness /wurth′ləsnəs/, a component of low self-esteem, characterized by feelings of uselessness and inability to contribute meaningfully to the well-being of others or to one's environment.

wound /wo͞ond/ [AS, *wund*], **1.** any physical injury involving a break in the skin, usually caused by an act or accident rather than by a disease, such as a chest wound, gunshot wound, or puncture wound. **2.** to cause an injury, especially one that breaks the skin.

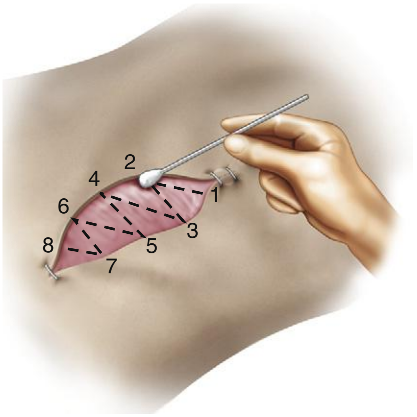
wound care, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of wound complications and promotion of wound healing. See also **Nursing Interventions Classification.**

wound care: burns, a nursing intervention from the Nursing Interventions Classification (NIC) defined as prevention of wound complications due to burns and facilitation of wound healing. See also **Nursing Interventions Classification.**

wound care: closed drainage, a nursing intervention from the Nursing Interventions Classification (NIC) defined as maintenance of a pressure drainage system at the wound site. See also **Nursing Interventions Classification.**

wound clip, a heavy metal clip used to approximate the edges of a skin incision. Also called **skin staple.**

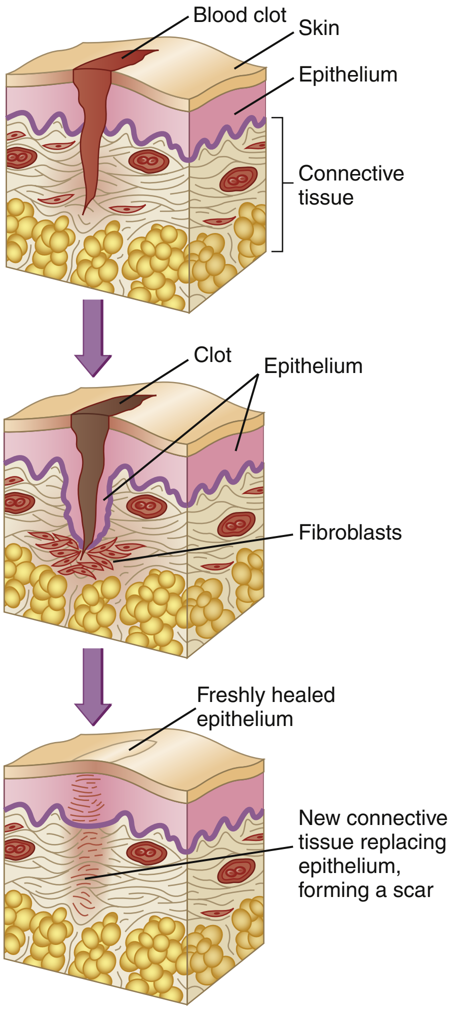
wound culture and sensitivity (C&S), a microscopic examination done to determine the presence of pathogens in patients with suspected wound infections, which are most often caused by pus-forming organisms. Most organisms require approximately 24 hours to grow in the laboratory, but when antibiotic therapy needs to be instituted before lab results are available, Gram's stain of the specimen smeared on a slide can be reported in less than 10 minutes to help determine the organism's possible identity and decide on an appropriate antibiotic treatment. Also combined with Giemsa's stain to better detect organisms.



Wound culture and sensitivity: swabbing the wound bed *(Harkreader, Hogan, and Thobaben, 2007)*

wound healing, a process to restore to a state of soundness any injury that results in an interruption in the continuity of external surfaces of the body. Also called **wound repair.** See also **healing, intention.**

wound healing: primary intention, a nursing outcome from the Nursing Outcomes Classification (NOC) is defined as the extent of regeneration of cells and tissues



Blood clot
Skin
Epithelium
Connective tissue
Clot
Epithelium
Fibroblasts
Freshly healed epithelium
New connective tissue replacing epithelium, forming a scar

Stages of wound healing *(Patton and Thibodeau, 2010)*

following intentional closure. See also **Nursing Outcomes Classification.**

wound healing: secondary intention, a nursing outcome from the Nursing Outcomes Classification (NOC) defined as the extent of regeneration of cells and tissues in an open wound. See also **Nursing Outcomes Classification.**

wound irrigation[1], the rinsing of a wound or the cavity formed by a wound using a medicated solution, water, or saline, or antimicrobial liquid preparation.

■ METHOD: A sterile irrigating solution is poured into a sterile bowl. It is then warmed in a basin of warm water unless the solution's action depends on antibiotic or enzyme activity, which would be inhibited by warming. An emesis or kidney basin is then fitted snugly against the patient's body beneath the wound. It may be held in place by the patient or by an assistant. A catheter is held with sterile gloves or forceps and gently inserted into the wound to a prescribed depth and at a prescribed angle. A syringe filled with irrigating solution is then attached to the catheter, and the solution is gently instilled. The catheter is pinched before the empty syringe is removed to prevent aspiration of the return irrigation flow during disconnection. The syringe is filled and attached again, and the wound is irrigated until the returning solution runs clear. If a catheter is not used, the solution is sprayed directly on the wound from the syringe until the wound looks clean. After irrigation is completed, the body area is dried with sterile sponges working from the wound out to the area around it, and a dry sterile dressing is applied.

■ INTERVENTIONS: Frequency of irrigation, type of solution, and amount of solution to be used are specifically prescribed. The condition of the wound, amount of irrigating solution used, and appearance of the returned solution should be documented.

wound irrigation[2], a nursing intervention from the Nursing Interventions Classification (NIC) defined as flushing of an open wound to cleanse and remove debris and excessive drainage. See also **Nursing Interventions Classification.**

Wound irrigation *(Harkreader, Hogan, and Thobaben 2007)*

Wound, Ostomy and Continence Nurses (WOCN) Society, an organization of nurses who manage conditions such as stomas, draining wounds, fistulas, vascular ulcers, pressure ulcers, neuropathic wounds, urinary incontinence, fecal incontinence, and functional disorders of the bowel and bladder. See also **enterostomal therapist.**

wound repair. See **wound healing.**

Wright-Giemsa stain, modified stain using combination of Wright's stain and Giemsa's stain in order to detect parasites, fungi, viral inclusion bodies, and other organisms in blood smears. See also **Giemsa's stain, Wright's stain.**

Wright's stain /rīts/ [James H. Wright, American pathologist, 1869–1928; Fr, *teindre,* to dye], a stain containing methylene blue and eosin that is used to color blood specimens for microscopic examination, such as for complete blood count and particularly for malarial parasites.

wrinkle test /ring′kəl/ [AS, *gewrinclian,* to wind; L, *testum,* crucible], a test for nerve function in the hand by observing the presence of skin wrinkles after the hand has been placed in warm water for 20 to 30 minutes. Denervated skin does not wrinkle.

wrist. See **carpal bones.**

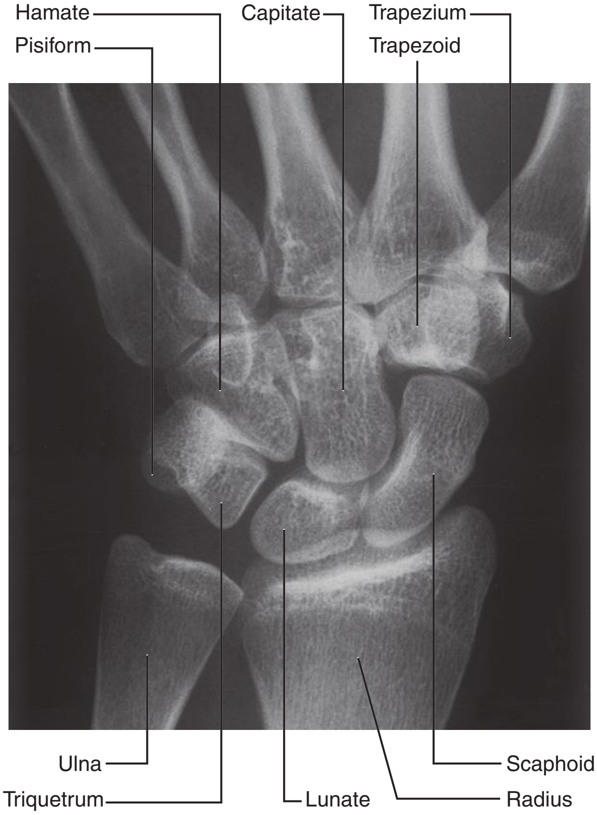
wrist clonus reflex /rist/, a sustained clonic muscle spasm caused by the sudden hyperextension of the wrist joint.

wristdrop [AS, *wrist* + *dropa*], a condition caused by paralysis of the extensor muscles of the hand and fingers or by injury of the radial nerve, resulting in inability to flex the wrist.

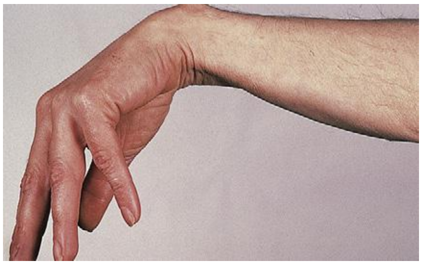
wrist ganglion, a cystic enlargement of a tendon sheath on the back of the wrist.

wrist joint. See **radiocarpal articulation.**

writer's cramp [AS, *writan,* to write, *crammian,* to fill], a painful, involuntary contraction of the muscles of the hand in a person attempting to write. It often occurs after long periods of writing. Also called **chirospasm** /kir′əspaz′əm/, **graphospasm.**



Wrist *(Drake, Vogl, and Mitchell, 2010)*



Wristdrop *(Perkin, 2002)*

wrongful birth /rông′fəl/ [OE, *wrang*, twisted; ME, *burth*], a belief that a birth could have been avoided if the parents had been properly advised by a physician or health care provider that a pregnancy could occur or that a fetus would be deformed.

wrongful death statute [AS, *wrang* + *death* + L, *statuere*, to place], (in law) a statute existing in all states that provides that the death of a person can give rise to a cause of legal action brought by the person's beneficiaries in a civil suit against the person whose willful or negligent acts caused the death. Before the existence of these statutes, a suit could be brought only if the injured person survived the injury.

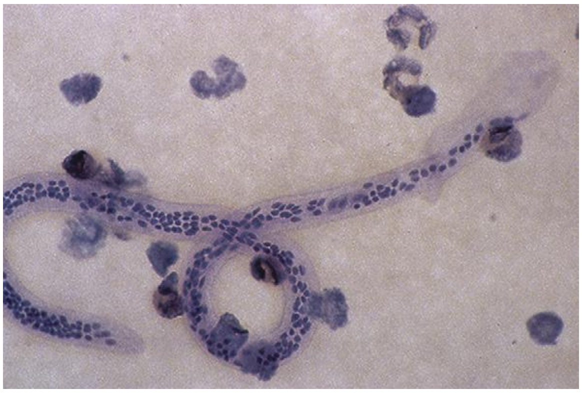
wrongful life [OE, *wrang*, twisted; AS, *lif*.]. See **wrongful birth.**

wrongful life action, (in law) a civil suit usually brought against a physician or health facility on the basis of negligence that resulted in the wrongful birth or life of an infant. The parents of the unwanted child seek to obtain payment from the defendant for the medical expenses of pregnancy and delivery, for pain and suffering, and for the education and upbringing of the child. Wrongful life actions have been brought and won in several situations, including malpracticed tubal ligations, vasectomies, and abortions. Failure to diagnose pregnancy in time for abortion and incorrect medical advice leading to the birth of a defective child also have led to malpractice suits for a wrongful life.

wryneck. See **torticollis.**

wt, abbreviation for **weight.**

Wuchereria /vo͞o′kərē′rē·ə/ [Otto Wucherer, German physician, 1820–1873], a genus of filarial worms found in warm, humid climates. *Wuchereria bancrofti,* transmitted by mosquitoes, is the cause of elephantiasis. See also **filariasis.**



***Wuchereria bancrofti* microfilaria**
(Mahon, Lehman, and Manuselis, 2011)

w/v, abbreviation for *weight per volume*. See **weight per volume solution.**

w/w, abbreviation for *weight per weight*.

Wyburn-Mason's syndrome /wī′bərn·mā′sənz/ [Roger Wyburn-Mason, British physician, 20th century], arteriovenous aneurysms on one or both sides of the brain, with ocular anomalies, especially in the retina, facial nevi, and sometimes mental retardation.

Wycillin, a trademark for an antibacterial (penicillin G procaine).

Wydase, a trademark for an enzyme **(hyaluronidase).**

Wymox, a trademark for an antibiotic **(amoxicillin).**

Wytensin, a trademark for an antihypertensive agent (guanabenz).

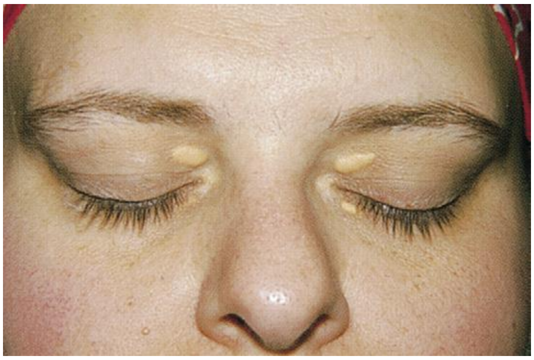
X

Xanax, a trademark for a benzodiazepine antianxiety agent **(alprazolam).**

-xanox, combining form for antiallergic respiratory tract drugs of the xanoxic acid group.

xanthan gum solution, a solution of xanthan gum, methylparaben, and propylparaben in purified water. Used as a suspending, stabilizing, emulsifying, and thickening agent.

xanthelasma /zan′thəlaz′mə/ [Gk, *xanthos,* yellow + Gk, *elasma,* plate], a planar xanthoma involving the eyelid(s). Also called **xanthoma palpebrarum.**



Xanthelasma *(Seidel et al, 2011/Courtesy John W. Payne, The Wilmer Ophthalmological Institute, The Johns Hopkins University and Hospital, Baltimore, Maryland)*

xanthelasmatosis /zan′thilaz′mətō′sis/ [Gk, *xanthos,* yellow, *elasma,* plate, *osis,* condition], a disseminated, generalized form of planar xanthoma frequently associated with reticuloendothelial disorders, especially multiple myeloma.

xanthene /zan′thēn/ [Gk, *xanthos,* yellow], a crystalline organic compound in which two benzene rings are fused to a central pyran ring. The pyran oxygen bridges the two benzene rings. It is a parent chemical structure of many medicinal elements.

xanthine /zan′thīn/ [Gk, *xanthos,* yellow], a nitrogenous by-product of the metabolism of nucleoproteins. It is normally found in the muscles, liver, spleen, pancreas, and urine. **—xanthic,** *adj.*

xanthine base [Gk, *xanthos,* yellow], a purine compound occurring in plants and animals as a metabolite of adenine and guanine. It is the parent structure of the methylxanthine alkaloids that include caffeine in coffee, theophylline in tea, and theobromine in cocoa.

xanthine derivative, any one of the closely related alkaloids caffeine, theobromine, and theophylline. They are found in plants widely distributed geographically and are variously ingested as components in beverages such as coffee, tea, cocoa, and cola drinks. The xanthine derivatives or methylxanthines have pharmacological properties that stimulate the central nervous system, produce diuresis, and relax smooth muscles. Theobromine has low potency and is seldom used as a pharmaceutic. Caffeine produces greater central nervous system stimulation than theophylline or theobromine. Caffeine and theophylline also affect the circulatory system, tending to dilate the systemic blood vessels but increasing cerebrovascular resistance with an associated decrease in cerebral blood flow and the oxygen tension of the brain. The ability of the xanthine derivatives to relax smooth muscle is used in certain treatments of asthma. Theophylline is most effective in such treatment and markedly increases vital capacity. The methylxanthines reinforce the release of certain secretions of various endocrine and exocrine tissues, except for mast cells and, possibly, certain other mediators of inflammation. Consumption of xanthine beverages may cause various problems, including restlessness and inability to sleep, GI irritation, and excessive myocardial stimulation characterized by premature systole and tachycardia.

xanthinuria /zan′thinyŏŏr′ē·ə/ [Gk, *xanthos* + *ouron,* urine], **1.** the presence of excessive quantities of xanthine in the urine. **2.** a rare disorder of purine metabolism, resulting in the excretion of large amounts of xanthine in the urine because of the absence of an enzyme, xanthine oxidase, that is necessary in xanthine metabolism. This inherited deficiency may cause the development of kidney stones made of xanthine precipitate.

xanthism /zan′thizəm/, a genetic pigment anomaly characterized by yellow or yellowish-red hair, coppered skin, and reddish-brown irises.

xantho-, combining form meaning "yellow": *xanthochroia, xanthogen, xanthophore.*

xanthochromia /zan′thəkrō′mē·ə/, a pale yellow or straw-colored discoloration of cerebrospinal fluid. It is caused by the presence of hemoglobin breakdown products, indicating that the cerebrospinal fluid has contained blood in the recent past.

xanthochromic /zan′thəkrō′mik/ [Gk, *xanthos* + *chroma,* color], having a yellowish color, such as cerebrospinal fluid that contains blood or bile. Also called *xanthochromatic.*

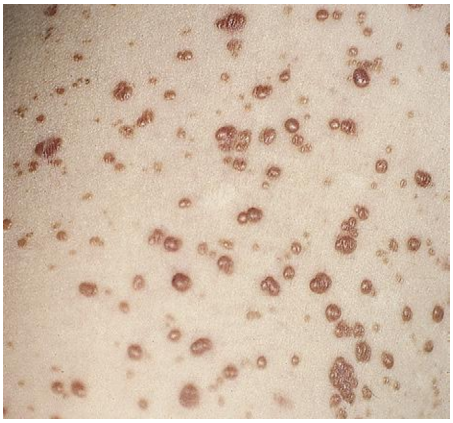
xanthoderma /zan′thədur′mə/, skin that has a yellow coloration, as in jaundice.

xanthogranuloma /zan′thəgran′yəlō′mə/ *pl.* **xanthogranulomas, xanthogranulomata** [Gk, *xanthos* + L, *granulum,* little grain; Gk, *oma,* tumor], a tumor or nodule of granulation tissue containing lipid deposits. A kind of xanthogranuloma is **juvenile xanthogranuloma.**

xanthogranulomatous cholecystitis, a type of chronic cholecystitis characterized by proliferative fibrosis and infiltration by lipid-laden macrophages. It is often accompanied by obstruction from gallstones or calculi.

xanthoma /zanthō′mə/ *pl.* **xanthomas, xanthomata** [Gk, *xanthos* + *oma,* tumor], a benign fatty fibrous yellowish plaque, nodule, or tumor that develops in the subcutaneous layer of skin, often around tendons. The lesion is characterized by the intracellular accumulation of cholesterol and cholesterol esters. It is associated with high cholesterol and/or triglycerides.

xanthoma disseminatum, a benign chronic condition in which small orange or brown papules and nodules develop on many body surfaces, especially on the mucous membrane of the oropharynx, larynx, and bronchi and in skinfolds and fissures. Also called **xanthoma multiplex.**



Xanthoma disseminatum *(Callen et al, 2000)*

xanthoma eruptivum. See **eruptive xanthoma.**

xanthoma multiplex. See **xanthoma disseminatum.**

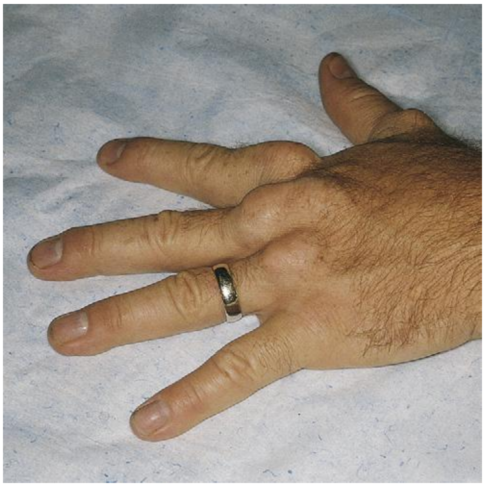
xanthoma palpebrarum. See **xanthelasma.**

xanthoma planum. See **planar xanthoma.**

xanthomasarcoma /zan′thōməsärkō′mə/ *pl.* **xanthomasarcomas, xanthomasarcomata** [Gk, *xanthos* + *oma* + *sarx,* flesh, *oma,* tumor], a giant cell sarcoma of the tendon sheaths and aponeuroses that contains xanthoma cells.

xanthoma striatum palmare, a yellow or orange flat plaque or slightly raised nodule occurring in groups on the palms of the hands.

xanthoma tendinosum, a yellow or orange elevated or flat round papule or nodule occurring in clusters on tendons, especially the extensor tendons of the hands and feet, of individuals with hereditary lipid storage disease.

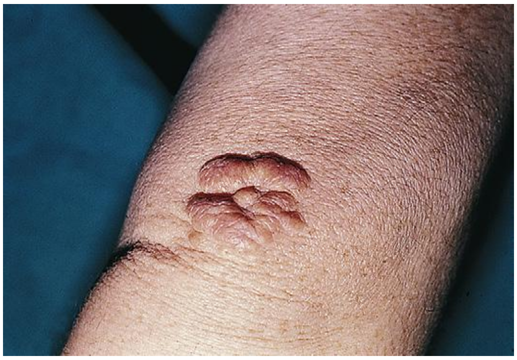


Xanthoma tendinosum *(Swartz, 2009)*

xanthomatosis /zan′thōmətō′sis/ [Gk, *xanthos* + *oma* + *osis,* condition], an abnormal condition in which there are deposits of yellowish fatty material in the skin, internal organs, and reticuloendothelial system. It may be associated with hyperlipoproteinemia, paraproteinemia, lipoid storage diseases, and other disorders of adipose tissue. Also called **xanthosis.** See also **lipemia, xanthoma, xanthoma palpebrarum.**

xanthomatosis bulbi, a fatty degeneration of the cornea.

xanthoma tuberosum, a yellow or orange flat or elevated round papule occurring in clusters on the skin of joints, especially the elbows and knees, usually in people who have a hereditary lipid storage disease such as hyperlipoproteinemia. The xanthomatous papules also may be associated with biliary cirrhosis and myxedema. Also called **tuberous xanthoma,** *xanthoma tuberosum multiplex.*



Xanthoma tuberosum *(Callen et al, 2000)*

Xanthomonas /zan′thəmon′əs/, a genus of gram-negative rod-shaped aerobic bacteria of the family Pseudomonadaceae that produces a yellow pigment.

Xanthomonas maltophilia, a species of *Xanthomonas* bacteria commonly found in water, milk, and frozen food and in the upper respiratory tract, blood, and urine of humans. It is an opportunistic cause of infections in hospitalized and immunocompromised patients. This organism has been reclassified as *Stenotrophomonas maltophilia.* Also called ***Pseudomonas maltophilia.***

xanthopsia /zanthop′sē·ə/ [Gk, *xanthos* + *opsis,* sight], an abnormal visual condition in which everything appears to have a yellow hue. It is sometimes associated with jaundice or digitalis toxicity.

xanthosis /zanthō′sis/ [Gk, *xanthos* + *osis,* condition], **1.** a yellowish discoloration sometimes seen in degenerating tissues of malignant diseases. **2.** See **xanthomatosis. 3.** a reversible yellow discoloration of the skin most commonly caused by the ingestion of large amounts of yellow or orange leafy vegetables containing carotene pigment. The antimalarial drug quinacrine, if taken over a prolonged period, may produce a similar skin color. Xanthosis may be differentiated clinically from jaundice because the sclerae are colored yellow in jaundice but are not discolored in xanthosis. Also called **carotenosis.** See also **carotenemia.**

xanthosis of retina, a generalized yellow discoloration of the posterior pole of the fundus, sometimes found in diabetic retinopathy.

xanthotoxin. See **methoxsalen.**

xanthurenic acid /zan′tho͝orē′nik/, a metabolite of tryptophan that occurs in normal urine and in elevated levels in patients with vitamin B_6 deficiency.

xanthurenic aciduria, a genetic disorder of tryptophan metabolism characterized by a deficiency of the kynureninase liver enzyme. It is also seen in vitamin B deficiency.

X chromosome, a sex chromosome that in humans and many other animals is present in both sexes, appearing singly in the cells of normal males and in duplicate in the cells of normal females. The chromosome is present in all of the female gametes and in half of the male gametes, is much larger than the Y chromosome, and has many sex-linked genes associated with clinically significant disorders, such as hemophilia, Duchenne's muscular dystrophy, and Hunter's syndrome. Compare **Y chromosome.**

Xe, symbol for the element **xenon.**

xen(o), word element [Gr.], *strange; foreign*.

xeno- /zē′ne-, zen′ō-/, combining form meaning "strange or pertaining to foreign matter": *xenodiagnosis, xenogenous, xenology*.

xenoantibody, an antibody produced in one species to an antigen derived from a different species.

xenoantigen /zē′nō·an′təjən/, an antigen that occurs in organisms of more than one species.

xenobiotic /-bī·ot′ik/ [Gk, *xenos,* strange, *bios,* life], a chemical compound foreign to a given biological system. With respect to animals and humans, xenobiotics include drugs, drug metabolites, and environmental compounds, such as pollutants that are not produced by the body. In the environment, xenobiotics include synthetic pesticides, herbicides, and industrial pollutants that would not be found in nature.

xenodiagnosis /-dī·agnō′sis/, a method of diagnosing a vector-transmitted infection such as Chagas' disease, in which a laboratory-reared, pathogen-free insect is allowed to suck blood from a patient. The intestinal contents of the insect are then examined for the presence of the pathogen.

xenogeneic /-jənē′ik/ [Gk, *xenos* + *genein,* to produce], **1.** denoting individuals or cell types of different species and different genotypes. **2.** denoting tissues from different species that are therefore antigenically dissimilar. Also called **heterologous.** Compare **allogenic, syngeneic.**

xenogenesis /zen′əjen′əsis/, **1.** alternation of traits in successive generations; heterogenesis. **2.** the theoretic production of offspring that are totally different from both of the parents. **—xenogenetic, xenogenic,** *adj.*

xenograft /zen′əgraft′/ [Gk, *xenos* + *graphion,* stylus], tissue from another species used as a temporary graft in certain cases, as in treating a severely burned patient when sufficient tissue from the patient or from a tissue bank is not available. It is quickly rejected but provides a cover for the burn for the first few days, reducing fluid loss from the open wound. Also called **heterograft.** Compare **allograft, autograft, isograft.** See also **graft.**

xenology /zēnol′əjē/ [Gk, *xenos,* stranger, *logos,* science], the study of parasites.

xenoma /zēnō′mə/, a tumor that develops on tissue infected with certain parasites.

xenon (Xe) /zen′on, zē′non/ [Gk, *xenos,* strange], a nonreactive gaseous nonmetallic element. Its atomic number is 54, and its atomic mass is 131.30.

xenon-133 [Gk, *xenos,* strange], a radioactive isotope of zenon gas, used in radiographic studies of the lung.

xenoparasite /-per′əsīt/, an ectoparasite that has become pathogenic as a result of weakened resistance of the host.

xenophobia /-fō′bē·ə/ [Gk, *xenos* + *phobos,* fear], an anxiety disorder characterized by a pervasive, irrational fear or uneasiness in the presence of strangers, especially foreigners, or in new surroundings.

Xenopsylla /zen′ōsil′ə/, a genus of parasitic fleas responsible for the transmission of bubonic plague, murine typhus, and other infections. Many of more than 30 species of *Xenopsylla* are vectors of pathogens, including *X. cheopis,* a rat flea found worldwide. It is a vector of *Yersinia pestis,* the bacterial source of murine typhus, as well as of the plague.

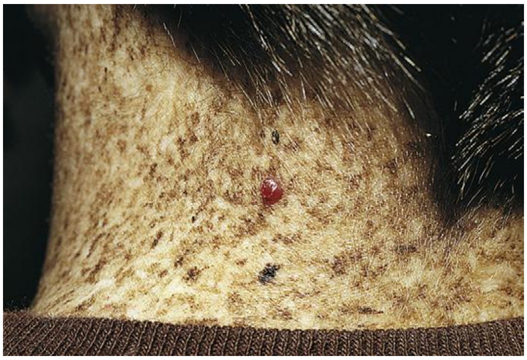
xenotransplant. See **cross-species transplant.**

xenotype /zen′ətīp/, molecular variation based on differences in structure and antigenic specificity, such as immunoglobulin from different species.

xero- /zir′ō-/, combining form meaning "dryness": *xerocheilia, xeromenia, xerophthalmia*.

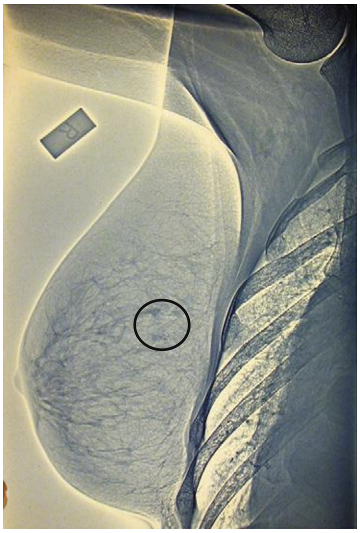
xeroderma /zir′ədur′mə/ [Gk, *xeros,* dry, *derma,* skin]. See **ichthyosis.**

xeroderma pigmentosum (XP), a rare, inherited skin disease resulting from faulty DNA repair, characterized by extreme sensitivity to ultraviolet light, exposure to which results in freckles, telangiectases, keratoses, papillomas, carcinoma, and, possibly, melanoma. Keratitis and tumors developing on the eyelids and cornea may result in blindness. Exposure to sunlight must be avoided. See also **Kaposi's disease.**



Xeroderma pigmentosum *(Callen et al, 2000)*

xerogram /zir′əgram′/ [Gk, *xeros* + *gramma,* record], an x-ray image produced by xeroradiography.



Xerogram *(Frank, Long, and Smith, 2012)*

xerography. See **xeroradiography.**

xeromammogram /-mam′əgram′/, a type of breast radiograph produced by xeroradiography.

xeromammography /-mamog′rəfē/, the use of xerographic methods to produce radiographic images of the breasts.

xerophthalmia /zir′ofthal′mē·ə/ [Gk, *xeros* + *ophthalmos,* eye], a condition of dry and lusterless corneas and conjunctival areas, usually the result of vitamin A deficiency and associated with night blindness.

xeroradiography /-rā′dē·og′rəfē/ [Gk, *xeros* + L, *radiare,* to emit rays; Gk, *graphein,* to record], a diagnostic x-ray technique in which images are produced electrically rather than chemically, permitting lower exposure times and radiation energies than those of ordinary x-rays. The latent image is made visible with a powder toner similar to that used in a copying machine. The powder image is transferred and heat-fused to a sheet of paper. The images exhibit "edge contrast" because of the shape of the electric fields that pull toner onto the plate. Such edge contrast is useful for identifying minute calcifications in the breast. Xeroradiography is used primarily for mammography. Also called **xerography.**

xerosis. See **dry skin.**

xerostomia /zir′əstō′mē·ə/ [Gk, *xeros* + *stoma,* mouth], dryness of the mouth caused by cessation of normal salivary secretion. The condition is a symptom of various diseases such as diabetes, acute infections, hysteria, and Sjögren's syndrome and can be caused by paralysis of facial nerves. It may also result from radiation treatments for cancers of the face, head, or neck. It is also caused by an adverse reaction to drugs.

xerotic eczema /zi·rot′ik ek′zə·mə/. See **asteatosis.**

xerotic keratitis /zirot′ik/ [Gk, *xeros,* dry, *keras,* horn, *itis,* inflammation], an inflammation of the cornea resulting from dryness of the conjunctiva. Underlying causes may be malnutrition, a deficiency of vitamin A, or autoimmune diseases.

xi /zī, sī/, Ξ, ξ, the fourteenth letter of the Greek alphabet.

Xifaxan, a trademark for **rifaximin.**

X-inactivation. See **Lyon hypothesis.**

xiphi-. See **xipho-.**

xiphisternal articulation /zif′istur′nəl/ [Gk, *xiphos,* sword, *sternon,* chest; L, *articulare,* to divide into joints], the cartilaginous connection between the xiphoid process and the body of the sternum. This joint usually ossifies at puberty. Compare **manubriosternal articulation.**

xiphisternum. See **xiphoid process.**

xipho-, xiphi-, combining form meaning "sword or xiphoid process": *xiphodymus, xiphoiditis, xiphopagus.*

xiphodynia /zī′fōdin′ē·ə/, a pain in the xiphoid process.

xiphoid /zif′oid/ [Gk, *xiphos,* sword, *eidos,* form], **1.** shaped like a sword. **2.** See **xiphoid process.**

xiphoid process /zif′oid/ [Gk, *xiphos* + *eidos,* form; L, *processus,* going forth], the smallest of three parts of the sternum, articulating with the inferior end of the body of the sternum above and laterally with the seventh rib. Several muscles of the abdominal wall are attached to the xiphoid process, including the rectus abdominis. Also called **ensiform cartilage, ensiform process, xiphisternum, xiphoid,** *xiphoid appendix*. Compare **manubrium.**

xiphopagus /zīfop′əgəs/, conjoined twins united at the xiphoid process of the sternum.

X-linked /eks′ lingkt/, pertaining to genes or to the characteristics or conditions they transmit that are carried on the X chromosome. Compare **Y-linked.** See also **sex-linked disorder. —X linkage,** *n.*

X-linked bulbospinal neuropathy, a hereditary disorder of the spinal cord and medulla oblongata in males, with associated endocrine features, including azoospermia, gynecomastia, glucose intolerance, and feminized skin changes.

X-linked disorder, disease or disorder associated with genetic abnormalities on the X chromosomes. Examples are the muscular dystrophies and hemophilias.

X-linked–dominant inheritance, a pattern of inheritance in which the transmission of a dominant allele on the X chromosome causes a characteristic to be manifested. Hypophosphatemic vitamin D-resistant rickets is an example of such inheritance. X-linked–dominant inheritance closely resembles autosomal-dominant inheritance. Compare **X-linked–recessive inheritance.** See also **sex-linked disorder.**

X-linked gene, a gene carried on the X chromosome; the corresponding trait, whether dominant or recessive, is always expressed in males, who have only one X chromosome. The term "X-linked" is sometimes used synonymously with "sex-linked," because no genetic disorders have as yet been associated with genes on the Y chromosome.

X-linked ichthyosis. See **sex-linked ichthyosis.**

X-linked inheritance, a pattern of inheritance in which the transmission of traits varies according to the sex of the person, because the genes on the X chromosome have no counterparts on the Y chromosome. The inheritance pattern may be recessive or dominant. The trait determined by a gene on the X chromosome is always expressed in males. Transmission from father to son does not occur. Kinds of X-linked inheritance are **X-linked–dominant inheritance** and **X-linked–recessive inheritance.** Compare **autosomal inheritance.** See also **sex-linked.**

X-linked lymphoproliferative syndrome, a rare X-linked immunodeficiency in which there is a normal response to childhood infection but infection with Epstein-Barr produces a fatal lymphoproliferative disorder. Most patients die of acute infection. Others develop hypogammaglobulinemia, B-cell lymphoma, aplastic anemia, or agranulocytosis.

X-linked mucopolysaccharidosis. See **Hunter's syndrome.**

X-linked–recessive inheritance, a pattern of inheritance in which the transmission of a recessive allele on the X chromosome results in a carrier state in females and characteristics of an abnormal condition in males. Affected people have unaffected parents (except for the rare situation in which the father is affected and the mother is a carrier). One half of the female siblings of an affected male carry the trait. Unaffected male siblings do not carry the trait. Sons of affected males are unaffected, and daughters of affected males are carriers. Unaffected male children of a carrier female do not carry the trait. Compare **X-linked dominant inheritance.**

XO, the designation of a cell in an individual in whom only one sex chromosome is present. Either the other X or the Y chromosome is missing so that each cell is monosomic and contains a total of 45 chromosomes. All XO individuals are females with **Turner's syndrome.** Individuals with only a Y chromosome do not survive.

Xolair, a trademark for **omalizumab.**

XP, abbreviation for **xeroderma pigmentosum.**

x radiation. See **x-ray.**

x-ray, 1. Also called **roentgen ray, x radiation,** electromagnetic radiation with wavelengths between about 0.005 and 10 nm. X-rays are produced when electrons traveling at high speed strike certain materials, particularly heavy metals such as tungsten. They can penetrate most substances and are used to investigate the integrity of certain structures, to therapeutically destroy diseased tissue, and to make radiographic images for diagnostic purposes, as in radiography and fluoroscopy. **Discrete x-rays** are those with precisely fixed energies that are characteristic of differences between electron binding energies of a particular element. Tungsten, for example, has 15 different effective energies and no more, representing emissions from 5 different electron shells. **2.** a radiograph made by projecting x-rays through organs or structures of the body onto a photographic film. Structures that are relatively radiopaque (allow few x-rays to pass through), such as bones and cavities filled with a radiopaque contrast medium, cast a shadow on the film. Also called **x-ray film. 3.** to make a radiograph. See also **contrast medium, electron, fluoroscopy, radiopaque.**

x-ray dermatitis, a skin inflammation caused by exposure to x-rays. Excessive exposure to x-rays can lead to skin cancer.

x-ray film. See **x-ray.**

x-ray fluoroscopy, real-time imaging using an x-ray source that projects through the patient onto a fluorescent screen or image intensifier. Image-intensified fluoroscopy has replaced conventional fluoroscopy in current practice.

x-ray microscope, a microscope that produces images using x-rays and records them on fine-grain film or projects them as enlargements. Film images produced by x-ray microscopes may be examined at large magnifications with a light microscope.

x-ray pelvimetry, a radiographic examination used to determine the dimensions of the bony pelvis of a pregnant woman and, if possible, the biparietal diameter of her baby's head. It is performed when doubt exists as to whether the head can pass safely through the pelvis in labor. Images of the pelvis and the baby are projected radiographically onto film. After the film is developed, the images are measured. The measurements are corrected for distortion, and the true dimensions of the birth canal and head are calculated. Often the cephalopelvic relationship cannot be accurately evaluated from the films because the baby's head may be positioned in such a way that the biparietal diameter cannot be visualized. Because minor degrees of cephalopelvic disproportion are often overcome safely in labor by molding of the fetal skull and because major disproportions may be detected by clinical pelvimetry without x-rays, the value of x-ray pelvimetry is frequently judged to be insufficient to warrant the risk of radiation exposure. Other diagnostic tools, among them ultrasonography, often provide the necessary information with less apparent risk. Compare **clinical pelvimetry.** See also **cephalopelvic disproportion, contraction, dystocia.**

x-ray technologist. See **radiological technologist.**

x-ray tube, a large vacuum tube containing a tungsten filament cathode and an anode that often is a tungsten disk. When heated to incandescence, the cathode emits a cloud of electrons that produce x-rays when they strike the surface of the anode at high speed. The anode is designed to deflect the x-rays toward an object to be radiographed. X-ray tubes are produced in a variety of designs for different purposes. Low-kilovoltage x-ray tubes may contain anodes made of molybdenum rather than tungsten. Some anodes are stationary and others rotate at high speed. Because of the intense heat generated by x-ray production, the specific design usually includes devices to help dissipate the heat.

x-tra density /ek′strə/, an image on an x-ray film caused by the presence of a foreign object, such as a bullet or surgical clip in the patient's body.

XX /ekseks′/, the designation for the normal sex chromosome complement in the human female. See also **X chromosome.**

XXX syndrome /trip′əleks′/, a human sex chromosomal aberration characterized by the presence of three X chromosomes and two Barr bodies instead of the normal XX complement, so that somatic cells contain a total of 47 chromosomes; trisomy X. The condition occurs approximately once in every 1000 live female births and is confirmed diagnostically by the presence of the extra Barr body in the cells. Individuals with the anomaly show no significant clinical manifestations, although there is usually some degree of mental retardation. Because selective migration of the X chromosome occurs during meiosis, half of the offspring of a trisomy X female will be both chromosomally and phenotypically normal. Also called **triple X syndrome.**

XXX, XXXX, XXXXX /fôreks′, fīveks′/, the designations for abnormal sex chromosome complements in the human female in which there are, respectively, three, four, or five instead of the normal two X chromosomes so that each somatic cell contains a total of 47, 48, or 49 chromosomes. Although there is no consistent phenotype associated with such aberrations, the risk of congenital anomalies and mental retardation in the affected individual increases significantly as the number of X chromosomes increases.

XXXY, XXXXY, XXYY /thrē′ekswī, fôr′ekswī, dob′əleks′dob′əlwī′/, the designations for abnormal sex chromosome complements in the human male in which there are more than the normal one X and one Y chromosome, resulting in a total of 48, 49, or more chromosomes in each somatic cell. The aberration is a variant of Klinefelter's syndrome. In general, the more X chromosomes there are, the greater the number of congenital defects and the severity of mental retardation in the affected individual. See also **Klinefelter's syndrome.**

XXY syndrome. See **Klinefelter's syndrome.**

XY /ekswī′/, the designation for the normal sex chromosome complement in the human male. See also **X chromosome, Y chromosome.**

xylitol /zī′litôl/, a five-carbon sugar alcohol derived from xylose and as sweet as sucrose. Used as a noncariogenic sweetener and also as a sugar substitute in diabetic diets.

xylo-, combining form meaning "wood": *xyloketosuria, xylose, xylosuria.*

Xylocaine, a trademark for a local anesthetic (lidocaine).

xylometazoline hydrochloride /zī′lōmetaz′əlēn/, an alpha-adrenergic vasoconstrictor.

■ INDICATIONS: It is prescribed as an intranasal medication for the treatment of congestion due to colds, hay fever, sinusitis, and other upper respiratory allergies.

■ CONTRAINDICATIONS: Glaucoma or known hypersensitivity to this drug or to sympathomimetic medications prohibits its use. It is used with caution in patients having cardiovascular disease.

■ ADVERSE EFFECTS: Among the more serious adverse effects are irritation to the mucosa, rebound nasal congestion, and effects associated with systemic absorption, including sedation and alterations in cardiovascular function.

xylose /zī′lōs/, an aldopentose sugar produced by hydrolyzing straw and corn cobs. It is incompletely absorbed when taken by mouth and is used in diagnostic studies of the digestive tract.

xylose absorption test, a laboratory test for intestinal absorption of the monosaccharide D-xylose. Absorption of D-xylose occurs readily in the normal intestine but is diminished in malabsorption patients.

xysma /zis′mə/, membranous shreds sometimes found in the feces of patients with diarrhea.

XYY syndrome /eks′dob′əlwī′/, the phenotypic manifestation of an extra Y chromosome, which tends to have a positive effect on height and may have a negative effect on mental and psychological development. However, the anomaly also occurs in normal males. See also **trisomy.**

Xyzal, a trademark for **levocetirizine.**

Y

Y, symbol for the element **yttrium.**

-y, suffix meaning "a condition or processor having the nature or quality of": *gouty, myopathy.*

YAC, abbreviation for **yeast artificial chromosome.**

YAG, abbreviation for *yttrium aluminum garnet,* a crystal used in some types of lasers.

Yallow, Rosalyn Sussman [U.S, medical physicist, 1921 –2011], co-winner with Roger Guillemin and Andrew Schally of the 1977 Nobel prize for medicine or physiology for her work in endocrinology and development of the radioimmunoassay technique.

yang, a polarized aspect of ch′i that is active or positive energy. See also **ch′i, yin.**

Yangtze edema /yang′sē/, a name used in China to describe a localized pruritic and erythematous subcutaneous induration caused by *Gnathostoma spinigerum* larvae in gnathostomiasis.

Yankauer suction catheter, a rigid hollow tube made of metal or disposable plastic with a curve at the distal end to facilitate the removal of thick pharyngeal secretions during oral pharyngeal suctioning.

Yankauer suction catheter *(Sanders et al, 2007)*

yarrow, an herb native to Europe and Asia, now grown in North America.

■ USES: This herb is used to decrease bleeding, to improve circulation, and to treat GI disorders, hypertension, and thrombi. Chemical analysis supports the possibility of beneficial effects, but there are insufficient reliable data from human studies to assess its efficacy.

■ CONTRAINDICATIONS: Yarrow should not be used during pregnancy and lactation. It is also contraindicated in those with known hypersensitivity to this plant or other members of the Compositae family, such as *Chamomilla recutita, Tanacetum parthenium,* or *T. vulgare*.

yaw /yô/ [Carib, *VaVa*], a lesion of the syphilis-like tropical disease of yaws. The initial lesion or primary sore is identified as the **mother yaw.**

yawn /yôn/ [AS, *geonian*], an involuntary act of opening the mouth wide and taking a deep breath. It tends to occur when a person is bored, drowsy, or depressed and may be accompanied by upper body movements or the act of stretching to aid chest expansion.

yaws /yôs/ [Afr, *yaw,* raspberry,], a chronic nonvenereal infection caused by the spirochete *Treponema pallidum* subspecies *pertenue,* transmitted by direct contact. Yaws has been classified into four stages. **1.** primary: the initial lesion is observed. **2.** secondary stage: multiple lesions due to desemination of spirochetes. **3.** latent stage: this stage is asymptomatic; however, relapse of lesions may occur. **4.** tertiary stage: bone joint and soft tissue deformities may occur at this stage, and lesions are not contagious at this point. It is characterized by chronic, ulcerating sores anywhere on the body but usually on the legs, with eventual tissue and bone destruction, leading to crippling if untreated. The sores are yellowish or reddish tumors that in shape and appearance often resemble currants, strawberries, or raspberries. It is a disease of unsanitary living conditions and may be effectively treated with penicillin G. All serological tests for syphilis may be positive in yaws. The infection may afford protection against syphilis. Also called **bouba, buba, frambesia, framboesia, parangi, patek, pian.** Compare **bejel, pinta, syphilis.**

Yb, symbol for the element **ytterbium.**

Y-cartilage, a Y-shaped band of connective tissue that extends through the acetabulum to join the ilium, ischium, and pubis.

Y chromosome, a sex chromosome that in humans and many other animals is present only in the male, appearing singly in the normal male. It is present in one half of the male gametes and none of the female gametes, is much smaller than the X chromosome, and has genes associated with triggering the development and differentiation of male characteristics. Compare **X chromosome.**

years of potential life lost (YPLL), an evaluation of the economic, social, and other consequences of premature death in a population from injury or disease as compared to the potential productivity of the deceased if they had lived normal life spans.

yeast /yēst/ [AS, *gist*], any unicellular, usually oval, nucleated fungus that reproduces by budding. *Candida albicans* is a kind of pathogenic yeast.

yeast artificial chromosome (YAC), a yeast chromosome used in recombinant DNA procedures. It can carry large segments of foreign DNA.

yellow cartilage. See **elastic cartilage.**

yellow fever, an acute arbovirus infection transmitted by mosquitoes. It is characterized by headache, fever, jaundice, vomiting, and bleeding. There is no specific treatment, and mortality is about 5%. Recovery is followed by lifelong immunity. Immunization for travelers to endemic areas is advised. The vaccine against yellow fever is highly effective, producing a greater-than-10-year immunity to the disease. Nonhuman primates are a reservoir of infection.

yellow fever vaccine, a vaccine produced from live, attenuated yellow fever virus grown in chick embryos.

■ INDICATION: It is prescribed for immunization against yellow fever.

■ CONTRAINDICATIONS: Immunosuppression, pregnancy, or known hypersensitivity to chicken or egg protein prohibits its use.

■ ADVERSE EFFECTS: Among the more serious adverse effects are fever, malaise, and hypersensitivity reactions.

yellow hepatization. See **hepatization.**

yellow jacket venom, a toxin injected by the stings of wasps and hornets. It can induce potentially fatal anaphylactic shock.

yellow marrow, bone marrow in which the fat cells predominate in the meshes of the reticular network. See also **bone marrow.**

yellow nail syndrome, a condition in which there is complete or almost complete cessation of nail growth and loss of cuticle. Nails become thickened, convex, opaque, and pale yellow to yellowish green. The condition is associated with pulmonary disorders and lymphedema.

yerba maté, an herbal product taken from an evergreen tree belonging to the holly family that is native to parts of South America.

■ USES: This herb is used as a diuretic and depurative.

■ CONTRAINDICATIONS: Yerba maté should not be used during pregnancy and lactation, in children, or in those with anxiety disorders, hypertension, or known hypersensitivity to this plant.

Yersinia /yersin′ē·ə/ [Alexandre E.J. Yersin, French bacteriologist, 1862–1943], a genus of nonmotile ovoid or rod-shaped gram-negative bacteria of the Enterobacteriaceae family.

***Yersinia* arthritis** [Alexandre E.J. Yersin], a polyarticular inflammation occurring a few days to 1 month after the onset of infection caused by *Yersinia enterocolitica* or *Y. pseudotuberculosis* and usually persisting longer than 1 month. Knees, ankles, toes, fingers, and wrists are most often affected. Cultures of synovial fluid yield no infectious organism. The clinical presentation may mimic juvenile rheumatoid arthritis, rheumatic fever, or Reiter's syndrome and may be associated with erythema nodosum or erythema multiforme. Treatment is with antibiotics.

Yersinia enterocolitica, a ubiquitous species isolated from mammals, birds, and frogs, and from material contaminated by feces; it is transmitted by infected food and water and by person-to-person contact and causes yersiniosis in humans. Some strains produce a heat-stable exterotoxin.

Yersinia pestis [Alexandre E.J. Yersin; L, *pestis,* plague], a species of small gram-negative bacteria that causes plague. The primary host is the rat, but other small rodents also harbor the organism. A person without symptoms may be a carrier, but this happens rarely. *Yersinia pestis* is hardy, living for long periods in infected carcasses, the soil of the host's habitat, or sputum. Also called ***Pasteurella pestis.*** See also **plague.**

Yersinia pseudotuberculosis, a species found in the intestinal tract of birds, rodents, and other animals. It causes mesenteric adenitis and pseudotuberculosis in humans who have contact with infected food or animals.

yersiniosis /yər·sin′·ē·ō′sis/, infection with bacteria of the genus *Yersinia,* especially *Y. enterocolitica,* which causes symptoms such as acute gastroenteritis and mesenteric adenitis in children and arthritis, septicemia, and erythema nodosum in adults.

Y fracture, a Y-shaped fracture of the tissue between condyles.

yield, **1.** an amount or quantity produced in return for an effort or investment. **2.** the energy released by a nuclear reaction.

yin, a polarized aspect of ch′i that is passive or negative energy. See also **ch′i, yang.**

yin/yang, a Chinese philosophy that each entity is one, but contains two equal and opposite forces. The forces of yang include maleness, the sun, and heat. The forces of yin include femaleness, darkness, and cold. Macrobiotic diets are based on the division of food into yin and yang properties. Many holistic care practices are rooted in the belief that there must be a balance between yin and yang forces for health and that illness is the result of imbalance.

yin/yang principle, in Chinese philosophy, the concept of polar complements existing in dynamic equilibrium and always present simultaneously. In traditional Chinese medicine, a disturbance of the proper balance of yin and yang causes disease, and the goal is to maintain or to restore this balance.

-yl, suffix used in naming radicals: *benzoyl, ethyl, hydroxyl.*

-ylene, suffix for chemical terms relating to a bivalent hydrocarbon radical, as in the reagent aminoxylene.

Y-linked /wī′lingkt/, pertaining to genes or to the characteristics or conditions they transmit that are carried on the Y chromosome. Excess hair on the pinna of the ear may be Y-linked. Compare **X-linked.** See also **sex-linked. —Y linkage,** *n.*

Yodoxin, a trademark for an antiamebic **(diiodohydroxyquin).**

yoga, a discipline that focuses on the body's musculature, posture, breathing mechanisms, and consciousness. The goal of yoga is attainment of physical and mental well-being through mastery of the body, achieved through exercise, holding of postures, proper breathing, and meditation.

yogurt /yō′gərt/ [Turk, *yoghurt*], a slightly acid, semisolid, curdled milk preparation made from either whole or skimmed cow's milk and milk solids by fermentation with organisms from the genus *Lactobacillus.* It is rich in B complex vitamins and a good source of protein. It also provides a medium in the GI tract that retards the growth of harmful bacteria and aids in mineral absorption. Also spelled *yoghurt.*

yohimbe, an herbal product taken from the bark of a tree that is native to areas of West Africa.

■ USES: This herb is used to treat male organic impotence due to prostate problems and has proven efficacy when used under medical supervision.

■ CONTRAINDICATIONS: Yohimbe can be dangerous and should not be used without medical supervision during pregnancy and lactation, in children, or in those with known hypersensitivity to this plant. Prolonged use is contraindicated, as is the use of this herb in persons with renal or hepatic disease, hypertension, angina pectoris, gastric or duodenal ulcers, bipolar disorder, anxiety disorder, schizophrenia, suicidal tendencies, and prostatitis. Yohimbe interacts with many other drugs.

yohimbe bark, a preparation of the bark of *Pausinystalia yohimbe,* used for the same indications as yohimbine hydrochloride; it has also been used traditionally as an aphrodisiac and for skin diseases and obesity.

yoke /yōk/ [L, *jungere,* to join], a connector used to link small cylinders of medical gases, such as portable oxygen tanks, to respiratory equipment.

yolk /yōk, yelk/ [AS, *geolca*], a material rich in fats and proteins that is contained in an ovum and that supplies nourishment to the developing embryo. The amount and distribution of the yolk within the ovum depend on the species of animal and the type of reproduction and development of offspring. In humans and most other mammals, yolk is absent or greatly diffused through the ovum. Mammalian embryos absorb nutrients directly from the mother through the placenta. Also called **vitellus.** See also **deutoplasm.**

yolk membrane. See **vitelline membrane.**

yolk sac, a structure that develops in the inner cell mass of the embryo and expands into a vesicle with a thick part that becomes the primitive gut and a thin part that grows into the cavity of the chorion. The cells of the extraembryonic mesoderm differentiate to develop endothelium, primitive blood plasma, and hemoglobin. The yolk sac usually disappears during the seventh week of pregnancy. See also **allantois, Meckel's diverticulum.**

yolk sphere. See **morula.**

yolk stalk, the narrow duct connecting the yolk sac with the midgut of the embryo during the early stages of prenatal development. It connects at the region of the future ileum and usually undergoes complete obliteration but occasionally may appear as a diverticulum. Also called **omphalomesenteric duct, umbilical duct, vitelline duct.** See also **Meckel's diverticulum.**

young and middle adult, the stages of life from 22 to 65 years of age.

Young-Helmholtz theory of color vision [Thomas Young, English physician, 1773–1829; Hermann L.F. von Helmholtz, German physician, physicist, and physiologist, 1821–1894], the concept that all color sensations are mediated by three types of retinal receptors, which correspond to three primary colors: red, green, and blue-violet. By their individual and combined activities, the receptors produce the perception of all visible hues.

young offender. See **juvenile delinquent.**

young-old, a term used to denote a person who is between 55 and 75 years of age.

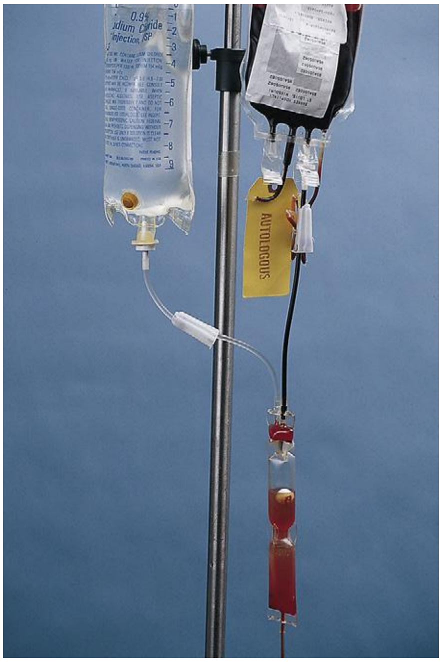
Young prostatic retractor [Hugh Young, American urologist, 1870–1945], a short straight surgical instrument with blades operated by a knob, for use in open perineal prostatectomy. The device can be inserted through the prostatic urethra and by direct traction used to draw down the prostate gland into the operative field.

Young's operation [Hugh Young], **1.** the surgical construction of a new urethra to repair a structural defect of the penis. **2.** perineal prostatectomy.

Y-plasty /wī′plas′tē/, a method of surgical revision of a scar, using a Y-shaped incision to reduce scar contractures. See also Z-**plasty.**

YPLL, abbreviation for **years of potential life lost.**

Y-set, a device composed of plastic components, used for delivering IV fluids through a primary IV line connected to a combination drip chamber filter section from which two separate plastic tubes lead to fluid sources. The Y-set also includes three clamps, one for the primary IV line and one for each of the two separate tubes. It is often used to transfuse blood cells for any type of blood administration that must be diluted with saline solution to decrease their viscosity. In such a transfusion one of the tubes is connected to the container of blood cells. The other tube is connected to the container of saline solution. Compare **component drip set, component syringe set, microaggregate recipient set, straight line blood set.** Also called Y-tubing.



Y-set *(Perry, Potter, and Elkin, 2012)*

ytterbium (Yb) /itur′bē·əm/ [Ytterby, Sweden], a rare earth metallic element. Its atomic number is 70, and its atomic mass (weight) is 173.04.

yttrium (Y) /it′rē·əm/ [Ytterby, Sweden], a scaly, grayish metallic element. Its atomic number is 39, and its atomic mass (weight) is 88.905. Radioactive isotopes of yttrium have been used in cancer therapy.

yttrium 90 Y ibritumomab tiuxetan, a chelate of ^{90}yttrium and the immunoconjugate ibritumomab tiuxetan, used in the treatment of non-Hodgkin's lymphoma. It is administered intravenously.

Z

zafirlukast, a leukotriene receptor antagonist interfering with substances that cause swelling and tightening of the airway.

■ INDICATIONS: This drug is used for prophylaxis and chronic treatment of asthma in children and adults.

■ CONTRAINDICATIONS: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include headache, dizziness, nausea, diarrhea, abdominal pain, vomiting, infections, pain, asthenia, myalgia, fever, dyspepsia, and increased ALT.

Zahorsky's disease. See **roseola infantum.**

Zakrzewski, Marie /zakshef′skē/, (1829–1902), a Polish-German-American midwife who studied medicine in Berlin before emigrating to the United States. In New York she met Elizabeth Blackwell, who encouraged her to continue her medical studies. After receiving her medical degree in Cleveland, she worked at Blackwell's New York Infirmary before going to Boston. In 1872, she organized the first successful American school of nursing at the New England Hospital for Women and Children.

zalcitabine, an antiretroviral nucleoside reverse transcriptase inhibitor analog. Also called **ddC, dideoxycytidine.**

■ INDICATIONS: It was prescribed in combination with other drugs for the treatment of human immunodeficiency virus infections. The sale and distribution of this medication was discontinued in the United States in 2006.

■ CONTRAINDICATIONS: The drug should not be given to patients with an allergy to zalcitabine or any of its components. Zalcitabine is not a cure, and acquired immunodeficiency syndrome patients may continue to acquire symptoms associated with the disease. Caution is recommended in patients with low CD4 cell counts, esophageal ulcers, numbness or tingling in the extremities, or a history of pancreatitis or alcohol abuse.

■ ADVERSE EFFECTS: The side effects most often reported include nausea, appetite loss, stomach pain, headache, dizziness, fatigue, dry mouth, and night sweats.

zaleplon, a sedative/hypnotic.

■ INDICATION: This drug is used to treat insomnia.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, confusion, anxiety, amnesia, depersonalization, hallucinations, hypesthesia, paresthesia, somnolence, tremor, vertigo, nausea, abdominal pain, constipation, anorexia, colitis, dyspepsia, dry mouth, vision changes, ear/eye pain, oversensitivity to sound, parosmia, asthenia, fever, headache, myalgia, and dysmenorrhea. Common side effects include lethargy, drowsiness, and daytime sedation. It should not be used longer than 2 to 3 weeks or with alcohol. Its effectiveness is decreased when taken with a high-fat meal.

zanamivir, an antiviral administered by oral inhalation.

■ INDICATION: Zanamivir is used in the treatment and prophylaxis of type A and B influenza in patients who have had symptoms for no more than 2 days.

■ CONTRAINDICATION: Known hypersensitivity to this drug prohibits its use.

■ ADVERSE EFFECTS: Adverse reactions to this drug include fatigue, ear-nose-throat infections, diarrhea, nasal symptoms, cough, sinusitis, and bronchitis. Common side effects include headache, dizziness, nausea, and vomiting.

Zarontin™, a trademark for an anticonvulsant **(ethosuximide).**

Zaroxolyn™, trademark for a diuretic and antihypertensive **(metolazone).**

Zavesca™, a trademark for **miglustat.**

Z band. See **Z line.**

Z chromosome. See **W chromosome.**

Z disk. See **Z line.**

ZDV, abbreviation for **zidovudine.**

Zeeman effect /sē′man, tsā′mon/ [Pieter Zeeman, Dutch physicist and Nobel Laureate, 1865–1945], a splitting of lines in an emission spectrum into three or more symmetrically placed lines when the radiation source is in a magnetic field.

ZEEP, abbreviation for **zero-end expiratory pressure.**

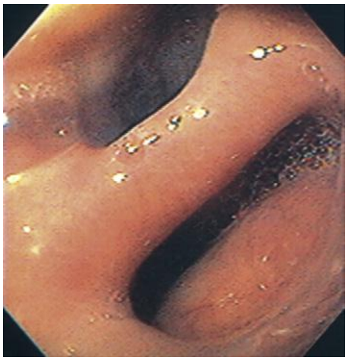
Zeitgeist /tsīt′gīst/ [Ger], literally, the spirit of the time, a climate of opinion, a convention of thought, or implicit assumptions.

Zellweger's syndrome [Hans Ulrich Zellweger, American pediatrician, 1909–1990]. See **cerebrohepatorenal syndrome.**

Zemuron, a trademark for a nondepolarizing neuromuscular blocking agent **(rocuronium bromide).**

Zenapax /ze′nah-paks/, a trademark for a preparation of **daclizumab,** an immunosuppressant used after kidney transplantation.

Zenker's diverticulum /tseng′kerz/ [Friedrich A. Zenker, German pathologist, 1825–1898; L, *diverticulare,* to turn aside], a circumscribed herniation of the mucous membrane of the pharynx as it joins the esophagus, just proximal to the cricopharyngeus muscle. It is the most common type of diverticulum of the esophagus. Food may become trapped in the diverticulum and can be aspirated. Diagnosis is confirmed by x-ray studies. In most cases the herniation is small, causes no dysfunction, is not diagnosed, and requires no treatment.



Zenker's diverticulum: endoscopic view

(Feldman, Friedman, and Brandt, 2010/Courtesy Dr. David Langdon, Arlington, Texas)

zeolites, hydrated silicates of aluminum used in ion exchange water softeners. Synthetic zeolites are used as porous molecular containers for reagents and drugs.

Zephiran Chloride, a trademark for a disinfectant **(benzalkonium chloride).**

zeranol /zer′ənol/, an estrogenic substance used to fatten livestock in the United States and Canada. Consumption of beef from zeranol-treated cattle has been associated with precocious puberty in some boys and girls.

Zerit, a trademark for a synthetic thymidine nucleoside analog **(stavudine).**

zero /zir′ō/ [Ar, *sifr,* cipher], **1.** nothing. **2.** the point on most scales from which measurements begin. **3.** absolute zero (0° K) on the Kelvin scale, the temperature at which there is no molecular movement, corresponding to −273.15° C or −459.67° F.

zero balance, a state in which the amount of water or an electrolyte excreted from the body is exactly equal to that ingested. See also **equilibrium.**

zero dose, the absence of added ligand.

zero-end expiratory pressure (ZEEP) [Ar, *zefiro* + ME, *ende*], pressure in the airways that has returned to ambient or atmospheric pressure at the end of exhalation.

zero fluid balance, a state in which the amount of fluid intake is equal to the amount of fluid output.

zero gravity, a physical state of weightlessness in space or during flight when the centrifugal thrust on a body in a parabolic glide exactly counteracts the force of gravity.

zero order kinetics, a state at which the rate of an enzyme reaction is independent of the concentration of the substrate.

zero population growth (ZPG), a situation in which there is no population increase during a given year because the total of live births is equal to the total of deaths.

zero-to-three infant stimulation groups, groups that provide therapeutic services for children from birth to 3 years of age, an age group not yet eligible for public school placement.

zero V/Q, an intrapulmonary shunt that allows blood to pass through the lungs without entering alveolar capillaries, causing hypoxemia. Also called **true shunt.**

Zestril, a trademark for an angiotensin-converting enzyme inhibitor and antihypertensive (lisinopril).

zeta /zē′tə, zā′tə/, Z, ζ, the sixth letter of the Greek alphabet.

zetacrit /za′tah-krit/, the packed-cell volume produced by the zeta sedimentation ratio procedure.

Zetafuge /za′tah-fūj/, a trademark for a specially designed centrifuge used in determination of the zeta sedimentation ratio.

zeta potential [Gk, *zeta,* sixth letter of Greek alphabet; L, *potentia,* power], the potential produced by the effective charge of a macromolecule, usually measured at the boundary between what is moving in a solution with the macromolecule and the rest of the solution.

Zetar, a trademark for a topical antieczematic containing coal tar.

zeugmatography /zo͞og′mətog′rəfē/ [Gk, *zeugnynai,* to join, *graphein,* to record]. See **magnetic resonance imaging.**

zidovudine (ZDV) /zīdov′ədēn/, a pyrimidine nucleoside analog active against human immunodeficiency virus. Formerly called **azidothymidine.**

■ INDICATIONS: Its function is to inhibit the reverse transcriptase enzyme of the human immunodeficiency virus (HIV). It is used in combination with other antiretroviral medications in the management of patients with HIV infection who have some evidence of impaired immunity. It also may be used for prophylaxis after exposure to HIV.

■ CONTRAINDICATIONS: It must be used cautiously in patients with impaired renal or hepatic function. It must also be used cautiously in patients with preexisting bone marrow suppression.

■ ADVERSE EFFECTS: Headache, GI disturbances, insomnia, flulike symptoms, rash, fatigue, myalgia, and central nervous system symptoms may occur during the first weeks of therapy. The drug may cause granulocytopenia and macrocytic anemia, particularly in patients with advanced HIV disease.

Ziehl-Neelsen test /zēl′ nēl′sən/ [Franz Ziehl, German bacteriologist, 1857–1926; Friedrich K.A. Neelsen, German pathologist, 1854–1894], one of the most widely used methods of acid-fast staining, commonly used in the microscopic examination of a smear of sputum suspected of containing *Mycobacterium tuberculosis.* See also **acid-fast stain.**

Ziehl's stain. See **carbol-fuchsin stain.**

Zieve's syndrome [Leslie Zieve, American physician, 1915–2000], a mild spherocytic anemia with transient jaundice and hyperlipidemia found in patients with acute alcoholism and liver cirrhosis. Not in common usage.

ZIFT, abbreviation for **zygote intrafallopian transfer.**

ZIG, abbreviation for **zoster immune globulin.**

zig-zag. See **swan neck deformity.**

zileuton, a bronchodilator and leukotriene pathway inhibitor.

■ INDICATIONS: This drug is used to treat allergic rhinitis and asthma.

■ CONTRAINDICATIONS: Factors that prohibit the use of this drug are hepatic disease, liver function test results three times higher than upper limits, and known hypersensitivity to zileuton.

■ ADVERSE EFFECTS: Adverse effects of this drug include dizziness, insomnia, fatigue, paresthesias, headache, nausea, abdominal pain, dyspepsia, diarrhea, liver function test abnormalities, hives, myalgia, and asthenia.

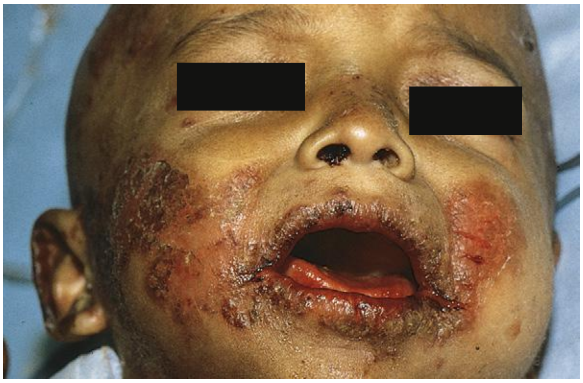
Zimmermann reaction /zim′ərman, tsim′ərmon/ [Wilhelm Zimmermann, German physician, b. 1910], a chromogen reaction previously used for detecting androgens with the 17-keto configuration. It involves a reaction between an alkaline solution of meta-dinitrobenzene and an active methylene group.

Zinacef, a trademark for a cephalosporin antibiotic **(cefuroxime sodium).**

zinc (Zn) /zingk/ [Ger, *Zink*], a bluish-white crystalline metal commonly associated with lead ores. Its atomic number is 30; its atomic mass is 65.38. It is ductile in its pure form and occurs abundantly in minerals such as sphalerite, zincite, and franklinite. It has many commercial uses, such as a protective coating for steel and in printing plates. It is an essential nutrient in the body and is used in numerous pharmaceutics, such as zinc acetate, zinc oxide, zinc permanganate, and zinc stearate. Zinc acetate is used as an emetic, a styptic, and an astringent. Zinc oxide is used internally as an antispasmodic and as a protective agent in ointments. Zinc permanganate is used as an astringent and in the treatment of urethritis by injection or douche in a 1:4000 solution. Zinc stearate is used as a water-repellent protective agent in the treatment of acne, eczema, and other skin diseases.

zinc chill. See **metal fume fever.**

zinc deficiency, a condition resulting from insufficient amounts of zinc in the diet. It is characterized by abnormal fatigue, decreased alertness, a decrease in taste and odor sensitivity, poor appetite, retarded growth, delayed sexual maturity, prolonged healing of wounds, and susceptibility to infection and injury. Other conditions that may precipitate the deficiency include alcoholic cirrhosis and other liver diseases, ulcers, and myocardial infarction. Prophylaxis and treatment consist of a diet of foods high in protein that are also rich in zinc, including meats, eggs, liver, seafood, legumes, nuts, peanut butter, milk, and whole-grain cereals.



[redacted] [redacted]

Zinc deficiency causing hemorrhagic dermatitis
(Kumar, Cotran, and Robbins, 2003)

zinc finger, a loop of a transcription factor that is stabilized by a zinc ion coordinated with histidine nitrogen atoms or cysteine sulfur atoms at critical junctures in a protein. It is an important step in the cloning and sequencing of human general transcription factors because individual proteins appear to be involved in the regulation of transcription and in RNA transport.

zinc gelatin, a topical protectant for varicosities and other lesions of the lower limbs. It is available as a smooth jelly containing zinc oxide (10%), gelatin (15%), glycerin (40%), and purified water (35%). It is also available impregnated in gauze.

zinc ointment [Ger, *Zink* + OFr, *oignement*], a preparation of 20% zinc oxide in mineral oil or a white petrolatum semisolid base, used as a local surface treatment for various skin disorders. Some preparations also may contain salicylic acid.

zinc oxide and eugenol (ZOE), a sedative dental cement composed primarily of zinc salts, eugenol (oil of cloves) and rosin, used chiefly in temporary tooth fillings. It has low relative strength and abrasion resistance, but its nearly neutral pH causes minimal irritation to dental pulp. It is intended as a sedative dressing until pain subsides and a more permanent filling can be inserted. Also called *zinc oxide eugenol dental cement*. See **temporary filling.**

zinc phosphate dental cement, a material for coating or attaching dental inlays, crowns, bridges, and orthodontic appliances and for some temporary restorations of teeth. It is prepared by mixing a powder composed of zinc and magnesium oxides and a liquid composed of phosphoric acid, water, and buffering agents.

zinc salt poisoning, a toxic condition caused by the ingestion or inhalation of a zinc salt. Symptoms of ingestion include a burning sensation of the mouth and throat, vomiting, diarrhea, abdominal and chest pain, and in severe cases shock and coma. Inhalation of zinc salts may cause metal fume fever; skin contact may produce blisters. A lethal dose of 10 g of zinc sulfate has been reported.

zinc sulfate, an ophthalmic astringent given in drops for nasal congestion or irritation of the eye, applied topically in deodorants, and given orally in tablets to promote healing and as a dietary supplement.

Zinecard™, a trademark for a cardioprotective agent against cardiac toxicity induced by doxorubicin **(dexrazoxane).**

ZIP, abbreviation for *zoster immune plasma*. See **chickenpox.**

ziprasidone /zipra′sidōn/, an antipsychotic medication used in the treatment of schizophrenia, administered orally as the hydrochloride salt.

zirconium granuloma, an inflammatory lesion, usually occurring in the axilla as a reaction to zirconium salts in antiperspirants.

Zithromax, a trademark for an antibiotic **(azithromycin).**

Z line, a narrow, darkly staining cross-striation that bisects the I band of skeletal muscles. The distance between Z lines is the length of the sarcomere. Also called **intermediate disk, Z band, Z disk.** See also **I band, sarcomere.**

Zn, symbol for the element **zinc.**

zoacanthosis /zō′akanthō′sis/, a dermatitis caused by retention in the skin of foreign bodies such as insect stingers, animal hairs, or bristles.

zoanthropy /zō·an′thrəpē/ [Gk, *zoon,* animal, *anthropos,* human], the delusion that one has assumed the form and characteristics of an animal. **—zoanthropic,** *adj.*

ZOE, abbreviation for **zinc oxide and eugenol,** a cement that is used in dentistry.

-zoite, combining form meaning a “simple organism” of a specified sort: *merozoite, saprozoite, sporozoite.*

zoledronic acid /zo′lĕ-dron′ik/, a bisphosphonate inhibitor of osteoclastic bone resorption, used for the treatment of hypercalcemia of malignancy. It is administered intravenously.

Zollinger-Ellison syndrome /zol′injər el′isən/ [Robert M. Zollinger, American surgeon, 1903–1992; Edwin H. Ellison, American physician, 1918–1970], a condition characterized by severe peptic ulceration, gastric hypersecretion, elevated serum gastrin, and gastrinoma of the pancreas or the duodenum. The syndrome is uncommon and occurs in a bipolar distribution such as in early childhood but is seen more frequently in people between 20 and 50 years of age. Two thirds of the tumors are malignant. Total gastrectomy may be necessary, but the administration of cimetidine in large doses may control gastric hypersecretion and allow the ulcers to heal. See also **peptic ulcer.**

zolmitriptan, a migraine agent.

- INDICATIONS: This drug is used in the acute treatment of migraine with or without aura.
- CONTRAINDICATIONS: Factors that prohibit the use of this drug include angina pectoris, a history of myocardial infarction, documented silent ischemia, ischemic heart disease, concurrent use of ergotamine-containing preparations, uncontrolled hypertension, known hypersensitivity to this drug, and basilar or hemiplegic migraine.
- ADVERSE EFFECTS: Adverse effects of this drug include palpitations, abdominal discomfort, myalgia, and chest tightness and pressure. Common side effects include weakness, neck stiffness, tingling, hot sensation, burning, a feeling of pressure and tightness in the head, numbness, dizziness, and sedation.

Zoloft™ /zo′loft/, a trademark for preparations of sertraline hydrochloride, an antidepressant, antiobsessional, and antipanic agent.

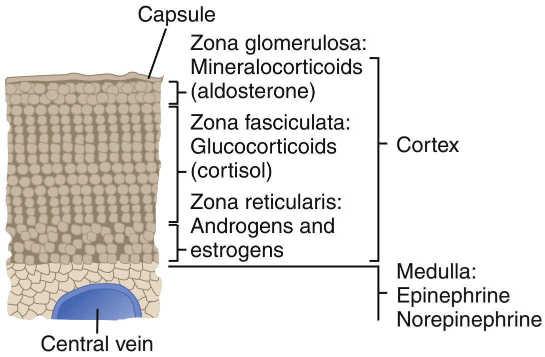
zolpidem /zōl-pi′dem/, a nonbenzodiazepine sedative and hypnotic used orally as the tartrate salt in the short-term treatment of insomnia.

zona /zō′nə/ *pl.* **zonae** [Gk, *zone,* belt], a zone, or girdlelike segment of a rounded or spheric structure. See also **zone.**

zona ciliaris. See **ciliary zone.**

zona fasciculata, the middle part of the adrenal cortex, which is the site of production of glucocorticoids and sex hormones.

zona glomerulosa, the outer part of the adrenal cortex, where mineralocorticoids are produced.



Capsule
Zona glomerulosa: Mineralocorticoids (aldosterone)
Zona fasciculata: Glucocorticoids (cortisol)
Zona reticularis: Androgens and estrogens
Cortex
Medulla: Epinephrine Norepinephrine
Central vein

Adrenal gland: cross section showing zona glomerulosa, zona fasciculata, and zona reticularis
(Black and Hawks, 2009)

zona pellucida /pəlo͞o′sidə/, the thick, transparent, noncellular membrane that encloses a mammalian ovum. It is secreted by the maturing oocyte during its development in the ovary and is retained until near the time of implantation. Also called **oolemma.** See also **vitelline membrane.**

zona radiata, a zona pellucida that has a striated appearance caused by radiating canals within the membrane. Also called **zona striata.**

zona reticularis, the innermost part of the adrenal cortex, which borders on the adrenal medulla part of the gland. It acts in consort with the zona fasciculata in producing various sex hormones and glucocorticoids.

zona striata. See **zona radiata.**

zonate /zō′nāt/, having ringed layers with differing colors or textures.

zone [Gk, belt], an area with specific boundaries and characteristics, such as the epigastric, mesogastric, and hypogastric zones of the abdomen or the breasts, lips, or genitals. See also **zona.**

zone of equivalence, a region of an antibody-antigen reaction in which concentrations of both reactants are equal.

zonesthesia /zō′nesthē′zhə/ [Gk, *zone* + *aisthesis,* feeling], a painful sensation of constriction, as of a bandage bound too tightly, especially experienced around the waist or abdomen. Also called **girdle sensation.**

zone therapy, the treatment of a disorder by mechanical stimulation and counterirritation of a body area in the same longitudinal zone as the affected organ or region.

zonifugal /zōnif′yəgəl/ [Gk, *zone,* belt; L, *fugere,* to flee], moving from within a zone or area outward.

zonisamide /zo-nis′ah-mīd′/, a sulfonamide that acts as an anticonvulsant, used as an adjunct in the treatment of partial seizures in adults. It is administered orally.

zonography /zōnog′rəfē/ [Gk, *zone* + *graphein,* to record], an x-ray imaging technique used to produce films of body sections similar to those made by tomography. A very narrow exposure angle of less than 10 degrees is used in zonography, producing a focal zone of less than 1 inch in thickness.

zonula /zōn′yələ/ *pl.* **zonulae** [Gk, *zone,* belt], a small zone or band. Also called **zonule.**

zonula adherens [L, *zone,* belt, *adhaerere,* to stick], a continuous zone running around the outer surface of a cell in which there is an intercellular space of about 15 to 20 nm width. A component of the junctional complex between cells, the zone contains dense filamentous material.

zonula ciliaris. See **zonule of Zinn.**

zonulae, zonule. See **zonula.**

zonula occludens [L, *zona,* belt, *occludere,* to close up], a component of the junctional complex between cells in which there is no intercellular space and the plasma membranes of adjacent cells are in direct contact.

zoo-, zo- /zō′ə-/, combining form meaning "animal": *zooamylon, zoogony, zoonosis.*

zoobiology /-bī·ol′əjē/ [Gk, *zoon,* animal, *bios,* life, *logos,* science], the biology of animals.

zoochemistry /-kem′istrē/ [Gk, *zoon,* animal, *chemeia,* alchemy], the biochemistry of animals.

zooerastia. See **bestiality.**

zoogenous /zō·oj′ənəs/ [Gk, *zoon,* animal, *genein,* to produce], acquired from or originating in animals. See also **zoonosis.**

zoograft /zō′əgraft/ [Gk, *zoon* + *graphion,* stylus], tissue of an animal transplanted to a human, such as a heart valve from a pig to replace a damaged heart valve in a human.

zoologist /zō·ol′əjist/ [Gk, *zoon,* animal, *logos,* science], a person concerned with the scientific study of animals.

zoology /zō·ol′əjē/, the study of animal life.

zoom /zo͞om/, a system of camera lenses that allows an object to remain in focus when the camera approaches or recedes or when the object is viewed close-up or at a distance.

zoomania /zō·əmā′nē·ə/ [Gk, *zoon* + *mania,* madness], a psychopathological state characterized by an excessive fondness for and preoccupation with animals. **—zoomaniac,** *n.*

-zoon, combining form meaning a "living being": *dermatozoon, entozoon, hepatozoon.*

Zoon balanitis, a benign erythroplasia of the inner surface of the prepuce or the glans penis, characterized histologically by plasma cell infiltration of the dermis, and clinically by a moist, erythematous lesion. Plasma cell vulvitis is a corresponding condition in females.

zoonosis /zō·on′əsis, zō′ənō′sis/ [Gk, *zoon* + *nosis,* disease], a disease of animals that is transmissible to humans from its primary animal host. Some kinds of zoonoses are **equine encephalitis, leptospirosis, rabies,** and **yellow fever.**

zoonotic filariasis. See **dirofilariasis.**

zooparasite /zō·əper′əsīt/ [Gk, *zoon* + *parasitos,* guest], any parasitic animal organism. Kinds of zooparasites are **arthropods, protozoa,** and **worms. —zooparasitic,** *adj.*

zoopathology /-pəthol′əjē/, the study of the diseases of animals.

zoophilia /zō·əfil′ē·ə/ [Gk, *zoon* + *philein,* to love], **1.** an abnormal fondness for animals. **2.** (in psychiatry) a psychosexual disorder in which sexual excitement and gratification are derived from the fondling of animals or from the fantasy or act of engaging in sexual activity with animals. Also called *zoophilism* /zō·of′iliz′əm/. See also **paraphilia. —zoophile,** *n.,* **zoophilic, zoophilous,** *adj.*

zoophobia /-fō′bē·ə/ [Gk, *zoon* + *phobos,* fear], an anxiety disorder characterized by a persistent, irrational fear of animals, particularly dogs, snakes, insects, and mice. The condition is seen more often in women than in men, nearly always begins in childhood, and can typically be traced to some frightening or unpleasant experience involving an animal. Treatment consists of psychotherapy to uncover the cause of the phobic reaction followed by behavior therapy, specifically the techniques of systemic desensitization and flooding.

zoopsia /zō·op′sē·ə/ [Gk, *zoon* + *opsis,* vision], a visual hallucination of animals or insects, often occurring in delirium tremens.

zootoxin /zō′ətok′sin/ [Gk, *zoon* + *toxikon,* poison], a poisonous substance from an animal, such as the venom of snakes, spiders, and scorpions. **—zootoxic,** *adj.*

zoster. See **herpes zoster.**

zoster auricularis /zos′tər/, an acute earache with herpetic blebs on the eardrum and external auditory meatus caused by the herpes zoster virus and often associated with shingles.

zosteriform /zoster′ifôrm/ [Gk, *zoster,* girdle; L, *forma,* form], resembling the pocks seen in herpes zoster infection.

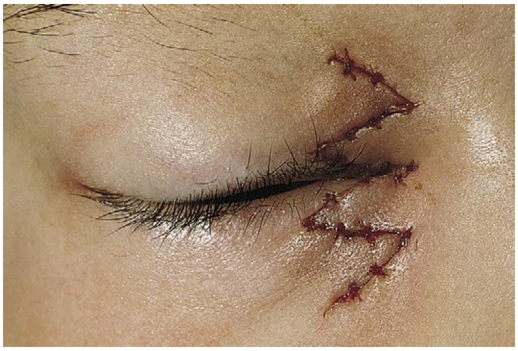
zoster immune globulin (ZIG) [Gk, *zoster* + L, *immunis,* freedom, *globulus,* small sphere], a passive immunizing agent currently in limited experimental use for preventing or attenuating herpes zoster virus infection in immunosuppressed individuals who are at great risk of severe herpes zoster virus infection.

zoster ophthalmicus [Gk, *zoster,* girdle, *ophthalmos,* eye], a herpes infection of the eye and the first division of the trigeminal nerve. The infection frequently involves the cornea. There may be lid edema, ciliary and conjunctival involvement, and pain. Keratitis may be severe. Scarring and glaucoma are common sequelae.

Zovirax, a trademark for an antiviral **(acyclovir).**

ZPG, abbreviation for **zero population growth.**

Z-plasty /zē′plas′tē/, a method of surgical revision of a scar or closure of a wound using a Z-shaped incision to reduce contractures of the adjacent skin. See also **Y-plasty.**



Z-plasty *(Tyers and Collin, 2008)*

Zr, symbol for the element **zirconium.**

***z*-score.** See ***z*-value.**

***z*-test,** a statistical test using normalized data (*z*-values) to determine if differences in proportions between sets of data or between individual members of different sets of data are large enough to be statistically significant.

Z-track, a technique for injecting irritating preparations into muscle without tracking residual medication through sensitive tissues. The tissue to be injected is pulled downward and in the direction of the body's midline. It is held in this position until the drug is injected. When the tissue is released, the usually straight needle track will become a broken line similar to the letter Z. This allows the medication to remain deep in the muscle and prevents upward seepage through the tissue along the needle track. The area is not massaged after injection. A separate needle is used after the medication is withdrawn from the vial. This eliminates depositing the drug along the needle track while it is piercing the skin.

Zuckerkandl fascia, the posterior part of the renal fascia.

Zung Self-Rating Depression Scale, a "self-report test" of 20 descriptors of depression on which clients rate themselves on a four-point scale ranging from "a little of the time" to "most of the time." The scale is useful in determining the depth or intensity of a client's depression.

***z*-value,** (in statistics) a normalized value created from a member of a set of data. Also called ***z*-score.**

zwieback /zwī′bak, zwē′-/ [Ger, *zwie,* twice, *backen,* to bake], a sweetened bread that is enriched with eggs and baked, then sliced and toasted until dry and crisp. It is used as a snack food for children, especially teething infants, or an early food given during convalescence.

zwitterion /tsvit′ərī′ən/, a molecule that has regions of both negative and positive charge. Amino acids such as glycine are almost always present as zwitterions when in neutral solutions. Also called **dipolar ion.**

zygapophyseal joint. See **facet joint.**

zygo- /zī′gō-/, **zyg-,** combining form meaning "union or fusion, yoked or joined, a junction or a pair": *zygomatic, zygogenesis, zygote.*

zygocyte. See **zygote.**

zygogenesis /zī′gōjen′əsis/ [Gk, *zygon,* yoke, *genesis,* origin], **1.** the formation of a zygote. **2.** reproduction by the union of gametes. **—zygogenetic, zygogenic,** *adj.*

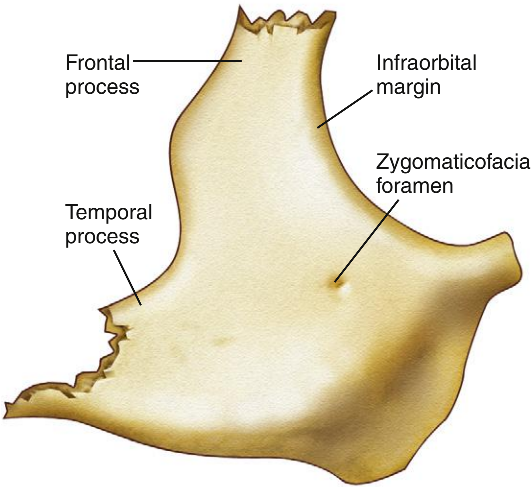
zygoma /zīgō′mə, zig-/ *pl.* **zygomas** [Gk, *zygon,* yoke], **1.** a long slender zygomatic process of the temporal bone, arising from the lower part of the squamous part of the temporal bone, passing forward to join the zygomatic bone, and forming part of the zygomatic arch. **2.** the zygomatic bone that forms the prominence of the cheek.

zygomatic /-mat′ik/ [Gk, *zygon,* yoke], pertaining to the zygoma, or malar bone of the face.

zygomatic arch [Gk, *zygon* + L, *arcus,* bow], an arch formed by the temporal process of the zygomatic bone with the zygomatic process of the temporal bone. The tendon of the temporal muscle passes beneath it.

zygomatic bone [Gk, *zygon* + AS, *ban*], one of the pair of bones that forms the prominence of the cheek, the lower part of the orbit of the eye, and parts of the temporal and infratemporal fossae.

zygomatic head. See **zygomaticus minor.**



Zygomatic bone

zygomatic nerve, a nerve originating from the maxillary nerve that divides into two branches that supply skin over the temple and skin adjacent to the zygomatic bone.

zygomaticofacial /zī′gōmat′ikōfā′shəl/, pertaining to the facial surface of the zygomatic bone.

zygomatic process [Gk, *zygon* + L, *processus*], **1.** a projection of the frontal bone forming the lateral boundary of the superciliary arch. **2.** a process of the maxilla. **3.** a process of the temporal bone.

zygomatic reflex [Gk, *zygon* + L, *reflectere,* to bend back], movement of the lower jaw toward the percussed side when the zygoma is tapped lightly but sharply.

zygomaticus major /zī′gōmat′ikəs/, one of the 12 muscles of the mouth. Arising from the zygomatic bone and inserting into the corner of the mouth, it acts to draw the angle of the mouth up and back to smile or laugh. Also called *zygomaticus.* Compare **zygomaticus minor.**

zygomaticus minor, one of the 12 muscles of the mouth. Arising from the malar surface of the zygomatic bone and inserting into the upper lip, it acts to deepen the nasolabial furrow in a sad facial expression. Formerly called **quadratus labii superioris.** Also called **zygomatic head.** Compare **zygomaticus major.**

zygomaxillare. See **key ridge.**

Zygomycetes /zi′go-mi-se′tēz/, a class of saprobic and parasitic fungi of the phylum Zygomycota; important pathogenic organisms are in the orders Entomophthorales and Mucorales.

zygomycosis /zī′gōmīkō′sis/ [Gk, *zygon* + *mykes,* fungus], an acute, often fulminant, and sometimes fatal fungal infection caused by a class of phycomycetal water molds the *Zygomycetes*, orders *Mucorales,* and *Entomophthorales.* It occurs primarily in patients with chronic debilitating diseases, especially uncontrolled diabetes mellitus. Characteristically it begins with fever, pain, and discharge in the nose and paranasal sinuses that progresses to invade the eye and lower respiratory tract. The fungus may enter blood vessels and spread to the brain and other organs. Transmission is usually by inhalation. The diagnosis is confirmed by biopsy and pathological examination of sputum. Treatment includes improved control of diabetes mellitus, extensive debridement of craniofacial lesions, and amphotericin B administered intravenously. Also called **mucormycosis.** Compare **phycomycosis.**

zygonema /zī′gənē′mə/ [Gk, *zygon* + *nema,* thread], the synaptic chromosome formation that occurs in the zygotene stage of the first meiotic prophase of gametogenesis. **—zygonematic,** *adj.*

zygopodium /zī′gōpō′dē·əm/, the part of an embryonic limb consisting of the radius and ulna or the tibia and fibula.

zygopophysial joints, the synovial joints between superior and inferior articular processes on adjacent vertebrae. A thin articular capsule attached to the margins of the articular facets encloses each joint.

zygosis /zīgō′sis/, a form of sexual reproduction in unicellular organisms, consisting of the union of the two cells and fusion of their nuclei. **—zygotic,** *adj.*

zygosity /zīgos′itē/, the characteristics or conditions of a zygote. The form occurs primarily as a suffix denoting genetic makeup, referring specifically to whether the paired alleles determining a particular trait are identical (homozygosity) or different (heterozygosity) or to the condition in twins of having developed from the fertilization of one ovum (monozygosity) or two (dizygosity).

zygospore /zī′gōspôr′/ [Gk, *zygon* + *sporos,* seed], the spore resulting from the conjugation of two isogametes, as in certain fungi and algae. Also called *zygosperm.*

zygote /zī′gōt/ [Gk, *zygon,* yoke], the combined cell produced by the union of a sperm pronucleus and an egg pronucleus at the completion of fertilization until the first cleavage. Also called **zygocyte.**

zygote intrafallopian transfer (ZIFT), retrieval of oocytes from the ovary, followed by their fertilization and culture in the laboratory and placement of the resulting zygotes in the fallopian tubes by laparoscopy 24 hours after oocyte retrieval. Used as a means of establishing pregnancy in treatment of infertility.

zygotene /zī′gətēn/ [Gk, *zygon* + *tainia,* band], the second stage in the first meiotic prophase of gametogenesis, in which synapsis of homologous chromosomes occurs. See also **diakinesis, diplotene, leptotene, pachytene.**

Zyloprim, a trademark for a xanthine oxidase inhibitor **(allopurinol).**

-zyme, zymo-, combining form meaning a “ferment or enzyme”: *lysozyme, serozyme, zymophore.*

zymogen, an inactive precursor that is converted into an active enzyme by action of an acid, another enzyme, or other means.

zymogen granules /zi′məjən/ [Gk, *zyme,* ferment, *genein,* to produce; L, *granulum,* little grain], granules found in some secretory exocrine cells. They contain the precursors of enzymes that become active after the granules leave the cell.

zymogenic cell. See **chief cell.**

zymoprotein /-prō′tēn/ [Gk, *zyme,* ferment, *proteios,* first rank], **1.** a yeast protein. **2.** any protein that functions as an enzyme.

zymorphic /zīmôr′fik/ [Gk, *zyme,* ferment, *morphe,* form], pertaining to fermentation properties. Also called *zymorphous* /zīmôr′fəs/.

Z.Z.′Z.″, symbol for increasing strength or intensity of contraction.

THE JOINT COMMISSION DO NOT USE ABBREVIATION LIST

Official "Do Not Use" List[1]

Do not use	*Potential problem*	*Use instead*
U (unit)	Mistaken for "0" (zero), the number "4" (four) or "cc"	Write "unit"
IU (International Unit)	Mistaken for IV (intravenous) or the number 10 (ten)	Write "International Unit"
Q.D., QD, q.d., qd (daily)	Mistaken for each other	Write "daily"
Q.O.D., QOD, q.o.d., qod (every other day)	Period after the Q mistaken for "I" and the "O" mistaken for "I"	Write "every other day"
Trailing zero (X.0 mg)*	Decimal point is missed	Write X mg
Lack of leading zero (.X mg)		Write 0.X mg
MS	Can mean morphine sulfate or magnesium sulfate	Write "morphine sulfate"
MSO_4 and $MgSO_4$	Confused for one another	Write "magnesium sulfate"

[1] Applies to all orders and all medication-related documentation that is handwritten (including free-text computer entry) or on preprinted forms.

*[*] **Exception:** A "trailing zero" may be used only where required to demonstrate the level of precision of the value being reported, such as for laboratory results, imaging studies that report size of lesions, or catheter/tube sizes. It may not be used in medication orders or other medication-related documentation.

Additional abbreviations, acronyms, and symbols
(For possible future inclusion in the Official "Do Not Use" List)

Do not use	*Potential problem*	*Use instead*
> (greater than)	Misinterpreted as the number "7" (seven) or the letter "L"	Write "greater than"
< (less than)	Confused for one another	Write "less than"
Abbreviations for drug names	Misinterpreted due to similar abbreviations for multiple drugs	Write drug names in full
Apothecary units	Unfamiliar to many practitioners Confused with metric units	Use metric units
@	Mistaken for the number "2" (two)	Write "at"
Cc	Mistaken for U (units) when poorly written	Write "mL" or "milliliters"
µg	Mistaken for mg (milligrams) resulting in 1000-fold overdose	Write "mcg" or "micrograms"
